ARCHITECT and surveyor's managing assistant, A.R.I.B.A., desires engagement at home or abroad. Twenty years' experience. Good testimonials and references.—C. A. C. Springfield, 31a, Leyland Road, Lee, S.E. 4542

ARCHITECT'S Assistant, well recommended, 14 years' good all-round experience; practical, working and detail drawings, quantities, specifications, supervision; salary 2½ guineas. — Box 4536, BUILDERS' JOURNAL Office.

ARCHITECT'S Assistant (26), disengaged, 10 years' experience; competent draughtsman, colourist, etc.; working drawings, details, surveying, levelling; specifications, specimens; excellent testimonials; moderate salary.—Box 4515, BUILDERS' JOURNAL Office.

ARCHITECT and Surveyor's Assistant (24), desires engagement; seven years' general experience, working and detail drawings, specifications, superintendence, surveying and levelling; excellent references; moderate salary.—H. M., Parkhurst. Ilkeston. 4514

ARCHITECT-SURVEYOR'S assistant requires situation at once. Three building construction certificates, and Prelim. R.I.B.A.; articled to A.M.I.C.E. and M.S.A.; good all-round experience. Age 24.—Box 4492, BUILDERS' JOURNAL Office.

ARCHITECT'S Assistant (33), disengaged; 14 years' experience in good offices; first-class testimonials, and references; can take charge; specimens sent; salary £2. — Box 4491, BUILDERS' JOURNAL Office.

BUILDER'S clerk, used to double entry, dissecting time sheets, etc.; good general experience; draughtsman; within 60 miles radius.—Henry, 4, Plimsoll Road, Finsbury Park, N. 4493

BUILDER'S assistant disengaged, 21 years' experience, comprising office routine, plans, specifications, quantities, outside supervision; measuring-up, levelling and surveying; good references; abstainer—L. J. Greaves, Prestwood, Great Missenden, Bucks. 4494

BUILDER, with nine years' experience in first-class house-building and general repairs, desires appointment; fair draughtsman, well up all trades, tradesman; moderate salary; highest references. —Box 4507, BUILDERS' JOURNAL Office.

BUILDER'S Assistant (24), 8 years in and outdoor experience with large London contractor; quantities, general office routine; assist estimating and supervision.—Box 4401, BUILDERS' JOURNAL Office.

BUILDER'S Assistant (23), disengaged; construction, surveying, mensuration; fair knowledge quantities and levelling; also costs, accounts, wages, etc.; good draughtsman; supervise jobs and assist estimating.—Box 4523, BUILDERS' JOURNAL Office.

CARPENTER and joiner, work wanted, piecework; any quantity; labour only; good references.—W., 14, Gorrings Park Avenue, Mitcham, Surrey. 4526

CARPENTER and joiner wants work; bench fixing, alteration, or jobbing. Could take charge of general work. Life abstainer. Good references. Age 32. Very energetic.—Pearson, 53, Hartham Road, Isleworth, W. 4471

CLERK of Works; age 30; practical and reliable; exceptional experience with buildings, plans, etc.; architectural training; would serve part time in office; cyclist.—Box 4464, BUILDERS' JOURNAL Office.

ENGINEER wants post, London or provinces; 12 years' experience; or undertakes preparations, calculations, quantities, designs, detail drawings, structural steelwork, and reinforced concrete.—Box 4451, BUILDERS' JOURNAL Office.

ESTIMATOR and building surveyor, Q.S.A., desires re-engagement with builder, architect, or surveyor; permanent or temporary; estimates, quantities, measurements, variations and accounts.—A 768, Fulham Road, London, S.W. 4501

EXPERT all-round Engineering draughtsman (over 10 years' experience) wishes for occasional work at his own home, or otherwise; lowest terms.—Freeman, 44, Horsell Road, Highbury, N. 4416

FOREMAN, decorator good colourman, grainer and paperhanger; able to estimate; thoroughly experienced in management of men, for general jobbing work; age 42; wages £2 per week.—Box 4524, BUILDERS' JOURNAL Office.

FOREMAN painter and decorator (well-experienced) wants re-engagement; not afraid of work. First-class references. Age 37.—Foreman, 16, Gambole Road, Garratt Lane, Tooting. 4431

FOREMAN of painters and decorators, take entire management of flats or estate; town or country; well up in all branches of building trades; total abstainer.—C/o G. N., Sanitary Works, Bridge Road, Chertsey. 4420

FOREMAN seeks engagement; shop or building; carpenter, joiner, practical, machinery, quick setter out; last refs. 7 years; age 38.—C. M., Cedars, Spring Road, Kempston, Bedford. 4483

GENERAL Foreman, of large and varied experience, thoroughly conversant with every branch of the trade, pushing and punctual; open to undertake any job; none too large; wages moderate.—J. M., 22, Eve Road, Tottenham. 4466

GOOD shopfitter and case-maker requires constant job; abstainer; refs. if required. Indoor hand. — Box 4388, BUILDERS' JOURNAL Office.

MACHINIST (joiner) requires re-engagement; good spindle hand, used to first-class work; 10 years last place; good references.—H. Cruse, Boxford, Newbury, Berks. 4537

MACHINIST seeks permanency; work spindle, planer, tenoner, morticer, dovetailer, sharpen saws, make cutters, take charge of small plant; country job preferred. — Machinist, 39, Cathnor Road, Shepherd's Bush, W. 4504

PAPERHANGER, practical, wants piecework; builders' flats, hotels, and clubs.—S. Jamer, 48, Carlisle Street, N.W. 4539

PLUMBER (Registered) wants re-engagement as leading hand or otherwise. Thoroughly practical in all latest sanitary improvements. Town or country.—R. P., 18, Chertsey Street, Tooting, S.W. 4482

PLUMBER, gas, hot water, lead-laying and sanitary, wants job, or constancy; town or country. —S. W., c/o Editor, Box 4510, BUILDERS' JOURNAL Office.

QUANTITY surveyor and draughtsman requires engagement; 15 years' experience; taking-off, etc., working drawings, specifications, supervision, passed final examination, Quantity Surveyors' Association; provinces preferred; low salary.—Box 4544, BUILDERS' JOURNAL Office.

SHOP Foreman of joiners seeks re-engagement, experienced, machinery, abstainer; reference; 11 years last situation; age 40.—T. R., 9, Second Avenue, Hendon, London, N.W. 4488

TO Property Owners.—Situation wanted on an estate or tenement property by a reliable man, aged 40, with a thorough practical experience of all repairs; capable of taking sole charge; distance no object.—Box 4503, BUILDERS' JOURNAL Office.

YOUNG Engineer (married), four years' Canadian experience, general engineering and concrete work (reinforced); returning to England, requires appointment; references from Can. Pack Railway. Apply T. B., 2, Grange Road, Ealing. 450

YOUTH (age 18) requires situation in builder's or surveyor's office. Desirous of learning estimating. Three years' previous experience.—Apply W. B., 8, Medley Road, West Hampstead, N.W. 444

£5 is deposited with cashier of a bank, and will be paid to anyone securing permanent position for draughtsman-surveyor desiring change; thorough constructional training, quantity surveyor fullest investigation; references; articles; age 23; salary, desired.—Box 4541, BUILDERS' JOURNAL Office.

Appointments Vacant.

ARCHITECT'S pupil, vacancy in busy West-end architect's office; small premium required but must be fond of drawing.—Stanley-Barrett and Driver, 23, York Place, Baker Street, W. 452

TRAVELLER wanted, with established connection amongst architects, builders, contractors, decorators, etc., to sell our Artificial Marble, on salary and Commission; must have exceptional reference as to ability. Apply by letter only, giving full particulars, and stating terms required, The Fassi Marble Company, Ltd., 46, Cannon Street, London, E.C. 444

WANTED, for a permanency in the office of an old established firm of surveyors in the city, a youth of good appearance and education, with previous office experience, who can write a good hand, quick and accurate.—Apply, in own handwriting, with copies of testimonials, stating salary asked, to Box 4457, BUILDERS' JOURNAL Office.

Business Wanted.

WANTED, a jobbing builder's business in London suburbs preferred. Apply, stating all particulars to Box 4415, BUILDERS' JOURNAL Office.

Businesses for Sale.

NEWPORT, SHROPSHIRE.

To be sold, the old-established builders' and contractor's business for many years carried on by Mr. George Ingram Muirhead, and for some time past known as "George Ingram Muirhead, Ltd.," situate adjoining and fronting the main road near the station (L. and N.W. Railway), Newport, Salop.

The yard is well equipped with all modern machinery and plant, and immediate possession can be given; all contracts just completed, stock-in-trade, machinery, etc., at a valuation; inspection by appointment.—Apply to Messrs. Poole and Davies, Auctioneers and Valuers, Newport, Shropshire. 4

JOBBING builder and decorators' business in Suffolk; old-established; freehold house and premises for sale.—Box No. 4475. BUILDERS' JOURNAL Office.

Partnerships & Practice

AN Architect and Surveyor practising in Essex is anxious to collaborate or enter into partnership with another architect practising within easy distance of Chelmsford. — Apply "Essex," 4508, BUILDERS' JOURNAL Office.

Dissolution of Partnership

MR. A. E. TUTTE, architect and surveyor, has dissolved partnership with Mr. Cook (Cook & Tutte) and closed the offices at 394, Commercial Road, Portsmouth, has opened offices at 91, London Road, Portsmouth. 4

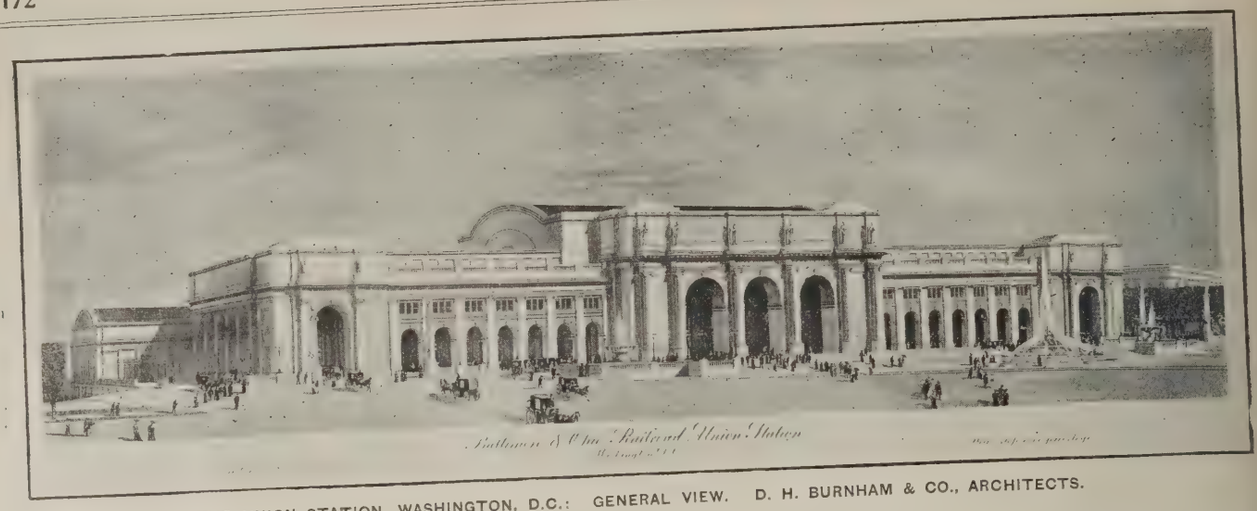
Roads and Rodomontade.

Is it not about time that the editors of our daily papers instituted a close season for the publication of wild and irresponsible schemes of road improvement? An elementary knowledge of motor mechanics does not necessarily fit its possessor to lecture experienced road engineers on the principles of their work, and some little discretion should be exercised by a responsible Press to extinguish mere assertive ignorance. A writer on motor matters in one London daily paper recently dealt with the comparative merits of Tarviated or Gladwellised roads and those of the Kent County Council in a manner that left no doubt of his complete ignorance of both. More recently still, we are treated, in the same organ, to a description of a patent for roads of five tracks, made of iron blocks, resting on cushions of indiarubber to deaden the sound. Has the editor no conception of the cost of iron blocks, and more particularly of indiarubber? And would not the trial and abandonment of iron roads in the long distant past be sufficient reason for withholding this priceless information, quite apart from the other facts (1) that no amount of indiarubber under the blocks would prevent noise; (2) that any horse would have its legs jarred to ruin in three days on such a road; and (3) that we could not find the hundreds of millions required to rebuild our roads on such lines even if we wanted to.

The Slump in Bricks.



The diminished demand for bricks is giving rise to the usual consequences of a depressed and overstocked market. There are the customary complaints of under-selling. In a report from Fletton, near Peterborough, where they have a capacity for turning out five hundred million bricks a year—which capacity is, for the moment, by no means being overstrained—it is observed that "it would be difficult to find an instance of a greater fall in selling prices than has been experienced in Fletton bricks," and figures are given showing that in 1896-7 the average price on rail was 22s. per 1,000; in 1898-9 20s.; in 1900, 17s.; 1901-2, 15s.; 1903, 15s. 6d.; 1904, 15s.; 1905, 13s.; 1906, 11s.; since which two bad years have been experienced. "The remedy," continues the report, "for the present low prices is obviously a combination among Fletton manufacturers, not necessarily in capital and control, but to provide concerted action which shall secure a profit to all, and mutual assistance in the moderate control of prices." Some of the makers, it is stated, do not agree with the proposals, but think that the lowest level having been probably reached, prices will improve without the creation of a trust. Desperate diseases are said to demand desperate remedies; and the formation of a trust is perhaps justified as a means of protection against ruinously unremunerative prices.

Sweating the Architect.

Lancashire Asylums Board is in the throes of a severe fit of economy, falsely so-called. Extensions to Whittingham Asylum are to be made, and it was proposed to pay the architect four per cent. A Mr. Short ("Short's, the friend—not Codlin") moved as an amendment, that the commission be five per cent., and argued "that it was as necessary to pay architects trade union rates as to pay artisans a standard rate of wages." Architects will hardly have the heart to disdain Mr. Short's inapt comparison, except perhaps on the ground that in one special particular it is glaringly fallacious. The standard rate set up for them is of the nature of a pious aspiration rather than of a dogmatic requirement, and mean clients can disregard it with comparative impunity; whereas, if they attempted to sweat the artisan there would be instant trouble. Mr. Short's amendment was lost, Alderman Greenwood expressing his confidence that "they could get the work done well at a commission of four per cent." Whether or not his confidence turns out to be too well founded, it is only fair to him to circulate as widely as possible among architects his sturdy championship of thrift. In the event, however, he and his niggardly Board may perhaps realise the impolicy of sweating the architect. Whether or not such pinching parsimony meets with its just retribution depends on the profession. A strict boycott would not be too severe a corrective of the Board's cynical assumption of the architect's squeezability and powerlessness.

Out-of-work Architects.

It is doubtless merely an ironic coincidence that brings to us on the same day a letter animadverting on the advantages of the A.A. School of Architecture at the advent of its new session, and the current issue of the A.A. Notes, wherein we find Mr. Philip Turner, F.R.I.B.A., correcting an impression that Canada is a Promised Land for English out-of-work architects, and also a sarcastic little note on "Architectural Practice in Great Britain," in which all architects are heartily recommended to try elsewhere, and where, it is asserted, only those who have been pupils of the assessor, or are related to members of the building committee, run any "risk" of winning a competition. Our leader of last week on this subject has attracted considerable attention, and "The Evening News," in quoting from it, gives point to our remarks by adducing the case of an architect, aged 31, who has been without a post for 15 months, and who has applied for 1,025 "situations vacant" without success. We have had advanced against us the old argument that those out of work are the half-educated and unskilled assistants and tracers, who are being displaced by the more thoroughly trained men from the modern schools, but we remain unconvinced. The schools are, without doubt, turning out highly trained men, but it is just these men, who have been imbued with a high sense of a great art, and with a keen sense of the rigid rules of professional etiquette, who are most likely to go under to men who are either untrained or who possess a less scholastic equipment and a more materialistic temperament. Much credit is due to leading members of the R.I.B.A. for the efforts they have made to improve our system of architectural education, but this is not enough. If you insist on a long and rigid schooling, you are surely under a moral obligation to make some effort to ensure a possibility of that training coming to its due fruition; or, alternatively, you must restrict the numbers of those who enter upon that training. It is hardly humane to take four or five years out of the life of a man and then turn him loose upon the world with the smallest concern as to his ultimate fate. The R.I.B.A. has the remedy to its hand if it likes to use it, and we need not specify what that remedy is. But at least it might devote its attention to a gross abuse under the present system, and regulate the proportion of paying pupils to paid assistants in the offices of its members. The letter from a correspondent, in another column, is eloquent testimony to the necessity of such a step, and the R.I.B.A. will not be the first professional institute to adopt the course suggested.

THE UNION STATION, WASHINGTON, D.C.: GENERAL VIEW. D. H. BURNHAM & CO., ARCHITECTS.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Sept. 15	REFORMERS' MEMORIAL AT GENEVA (funds expected to amount to £20,000). Sketch, plans, and plaster model. Premiums £6,000. Conditions from the Secrétariat de l'Association du Monument de la Réformation, 56, Rue du Stand, Geneva.
Oct. 7	BOAT SHELTER, INVERNESS. Engineers invited to submit plans for a scheme, not exceeding, in cost, the sum of £10,000. Conditions from Kenneth Macdonald, Clerk to the Harbour Trustees, Town House, Inverness.
Oct. 31	BURY. NEW SECONDARY SCHOOL for the Education Committee. Premiums of £50, £25, and £10. Particulars and site plan from Robert Wilkinson, Director of Education, 8, Bank Street, Bury. No deposit.
Oct. 31	*COUNTY HIGH SCHOOL FOR GIRLS, ROMFORD.—Applications for Conditions to D. T. Williams, 71, South Street, Romford, Essex, to be made by or before August 24th, accompanied by deposit of five guineas, of which sum five pounds will be returned on receipt of bona fide design.
Nov. 1	COUNTY HALL AND OFFICES, CARDIFF. Particulars and site plan from T. Mansel Franklen, Clerk, Glamorgan County Council Offices, Cardiff.

* *This competition has been unfavourably reported upon by a Correspondent.*

Ellesmere Port Free Library.

The designs of Messrs. Sproat and Warwick, architects, of Liverpool, for the Ellesmere Port Free Library, were recently selected, in a limited competition, by Mr. J. Swarbrick, F.R.I.B.A., of Manchester, the assessor appointed by the Council. The Council have since adopted the assessor's recommendation.

International Competitions.

As announced last week (p. 170), the special committee appointed at the seventh International Congress (London, 1906), to consider the question of international competitions, and to report thereon to the Vienna Congress, 1908, has drawn up its recommendations under twelve heads. These resolutions, as translated by Mr. John W. Simpson (F.), acting secretary of the British Section, and printed in the R.I.B.A. Journal, are as follows:—

1. International competitions should be reserved for exceptional occasions of a really international character.

2. International competitions may be either open to all architects without invitation, or limited, and by invitation. Limited and invited competitions may consist of a single stage. Competitions open to all should be held preferably in two stages.

3. The "conditions" of International competitions are to be identical for all competitors. No drawing or document submitted should be taken into consideration except those specified in the conditions.

4. The instructions to competitors should state definitely the conditions of the competition, and matters considered desirable should not be left to the option of competitors.

5. In limited and invited competitions the conditions should be fully detailed and should require the scheme to be fully developed. In competitions open to all, the conditions should express the technical requirements in general terms and limit the number and scale of the drawings to the minimum necessary for the jury to understand the design. The conditions should require designs to be submitted anonymously under motto in the first stage, and to be signed by the author in the second stage.

6. In double competitions the conditions in the first stage should be as those for competitions open to all, and in the second stage as those for limited and invited competitions. Designs selected in the first stage only can be admitted to the second stage.

7. The conditions of a competition should be published and placed at the disposal of competitors on the same date in all countries. The date of despatch (evidenced by the carrier's receipt, which must be sent on to the jury) is to be the date of closing the competition.

8. The conditions must be drawn up in one only of the four languages officially admitted at the International Congresses of Architects of 1907 (London) and 1908 (Vienna): English, French, German, or Italian. The conditions should be prepared in consultation with experienced architects.

9. The jury of an International Competition shall consist of seven architects, all of different nationality, one of whom shall belong to the country which institutes the competition. A legal authority, nominated by the administration promoting the competition, shall preside in order to insure regular procedure, but shall have no vote. The members of the jury by accepting nomination shall be held to have declared themselves to have no material interest, either directly or indirectly, in the execution of the work the subject of the competition.

10. It is desirable in International Competitions, and especially in the preliminary stages, that the exact limit of cost shall not be fixed, in order to leave full liberty to the artistic conception of competitors.

11. The total value of the premiums to be awarded shall be at least double that of the fees payable upon the execution of the work if it had been entrusted to an architect without competition. The principle must be enforced that the carrying out of the work be entrusted to the architect placed first, subject to the conditions in force in the country promoting the competition. The amount of the prize shall not be deducted from the amount of the fees payable. In the event of the person or corporation promoting the competition wishing to reserve the right to pass over the architect placed first, the conditions of competition must state the terms of compensation. Should the work not be executed, the same compensation shall be due. In all cases the authors of designs submitted retain all artistic right in their design and in the building erected from it.

12. In single-stage competitions all the designs shall be exhibited in a suitable place and for a sufficient time to enable all competitors to visit the exhibition which shall be advertised beforehand in the professional papers. In double competitions there shall be no exhibition after the first award. All the drawings shall be placed under seal and exhibited subsequently together with the designs in the final competition. The full report of the jury giving their reasons for the award shall be published before the opening of the exhibition for the information of all parties interested.

The special commission responsible for these resolutions consisted of A. Wels (Austria), L. Bonnier (France), L. Nels (Germany), John W. Simpson (Great Britain), M. E. Cannizzaro (Italy), Repulles y Vargas (Spain), and G. Totten (United States).

The resolutions were read at the closing meeting of the Vienna Congress, and approved of generally: but at the suggestion of Mr. John W. Simpson, the various nations adherent to the permanent committee are to have an opportunity of considering and confirming them. A member of each section of the Permanent Committee is to meet the other delegates at Paris with full powers

to discuss the said resolutions and settle a final and definite report. The meeting of the delegates is to take place during the second week of November next.

THE LATE HUGH HUTTON STANNUS.

By courtesy of a relative of the late Mr. Hugh Stannus, we are enabled to present the accompanying portrait of that distinguished architect, lecturer, and teacher, whose death, which occurred on August 18th, at his residence, The Cottage, Hindhead, Surrey, was recorded in our issue of August 26th. A few further particulars respecting his influential and eminently useful career may now be appropriately given.

Hugh Hutton Stannus was born at Sheffield, in 1840, and was the son of the Rev. Bartholomew Teeling Stannus. Hugh had an exceptionally brilliant career at the Sheffield School of Art, winning many prizes, among them being an award for the design for a pair of iron gates. Mr. Stannus acquired a thorough acquaintance with the technical details of foundry work, and some of his designs for metal-work were selected for the Exhibition of 1862. It was while he was articled to Messrs. Hoole, the famous metal-workers, at Sheffield, that he first met Alfred Stevens, who was then engaged upon the Wellington monument for St. Paul's.

Coming to London, Mr. Stannus entered the Architectural School of the Royal Academy. He began to practise as an architect in 1879, but while the commissions that he obtained were fulfilled with admirable skill and taste, it is to be regretted that he never had an opportunity of making a great name for himself as a designer of buildings. Mr. R. Phené Spiers, who contributes some recollections of him to the Journal of the Royal Institution of British Architects. recalls that Mr. Stannus sent in a set of drawings for the American competition for the University of California, and that though, in Mr. Spiers's opinion, Stannus showed a more thorough mastery of the peculiarities of the site than did any other competitor, he was probably placed at a disadvantage because, in the absence, in his case, of the sectional drawings which the French and American architects produced with elaboration and profusion, the judges disregarded, or perhaps did not quite understand, Stannus's really superior design.

Photo: Fradelle & Young.

THE LATE MR. H. H. STANNUS.

It was as lecturer and teacher that Stannus did his best work—in the architectural modelling schools of the Royal Academy; at University College, London; at the Royal College of Art, South Kensington; at the Manchester School of Art, where for two years he was director of architectural studies; at the evening schools of the Architectural Association; or before the Royal Society of Arts, where, in 1890, 1898, and 1901, he was Cantor lecturer. He was also an able and incisive writer, as those who remember his occasional contributions to this journal and to the "Architectural Review" will readily concede. His *magnum opus*, of course, is his fine folio volume on "Alfred Stevens and His Work," which was published in 1891. In the same year he issued "Decorative Treatment of Natural Foliage," and, four years later, a companion treatise on the "Decorative Treatment of Artificial Foliage." It is believed that he had been long collecting material for a work on the Classic orders, for which during his tours in Greece and Italy, he had taken many photographs. It is to be hoped that this work may yet see the light.

Mr. Stannus's connection with Alfred Stevens's world-famous monument to the Duke of Wellington in St. Paul's Cathedral is well known. He had acquired and jealously preserved Stevens's plaster model of the equestrian figure of the Duke, without which the monument must have remained incomplete, and he supplied the drawings that established Stevens's final intention with respect to the pedestal. It is pathetic to think that Mr. Stannus has not lived to see the final triumph of his loyal and persistent endeavours to see justice done to the masterpiece of this great though wayward genius.

Of Mr. Stannus's eloquence as a speaker, of his skill as a teacher, and of his rare elocutionary talent, his hearers speak with enthusiasm; but his large circle of pupils and friends will chiefly miss his ever-ready helpfulness. Architectural students have lost in him a generous and sympathetic friend. The remains were cremated at Woking on August 22nd.

IMPORTANT ANNOUNCEMENT.

We have much pleasure in announcing that we have made arrangements with the National Federation of Building Trades Employers of Great Britain and Ireland by which, beginning with next week's issue, the transactions of the Federation will be regularly and systematically recorded in our pages. The information that we shall thus present will be supplied officially from all quarters of the United Kingdom where associations in connection with the Federation have been established. It will therefore be comprehensive and authentic; and we believe that it cannot fail to be advantageous not only to members of this powerful organisation, but also to every reader of the journal who desires to keep well abreast of the varied and important interests that are directly or indirectly involved in the movements of the Federation and the allied societies.

Secretaries are reminded that reports intended for our next issue must reach this office not later than Friday next.

Proposed New Works.

The Local Government Board have decided to hold, or have recently held, as indicated by the appended dates, inquiries into proposed expenditure by public bodies as follows:—Water supply works and plant: Saint Ives B.C., £13,500 including the construction of a reservoir at Bussow Moor with a capacity of 22,000,000 gallons (September 8); Evesham R.D.C., £400, for Broadway (September 9); Faringdon R.D.C., £500, for Lechlade (September 11). Gasworks and plant: Leeds City Council, £65,000 (September 9); Hereford City Council, £2,000 (September 10). Electricity undertakings and plant: Darwen B.C., £4,300 (September 10). Wimbledon B.C., £6,000 (September 14); Clacton U.D.C., £500 (September 15). Sewerage, drainage, and sewage disposal works and plant: Leyton U.D.C., £3650 (September 15); Woodford U.D.C., £1,999 (September 7); Prescot U.D.C., £700 (September 11). Street improvements, new roads, public walks, and pleasure grounds: Tottenham U.D.C., £2,900 (September 13); Southampton B.C., £1,302 (September 4); Penmaenmawr U.D.C., £850 (September 8); Dalton-in-Furness U.D.C., £1,250 (September 8); Southgate U.D.C., £4,157 (September 8); Plympton Saint Mary R.D.C., £647 for Compton Gifford and £3,241 for Saint Budeaux (September 9); Turton U.D.C., £6,500 (September 9); Birkenhead B.C., £2,223 and £2,000 and £24,790 (September 9); Wallasey U.D.C., £430 (September 10); Darwen B.C., £13,050 (September 10). Various: Leyton U.D.C., £1,500, for underground convenience (September 15); Baildon U.D.C., £350, for public lighting, and £700 for depot (September 8); Aston Manor B.C., £400, for air-lift plant (September 8); Farnham R.D.C., £750, for engine-house, etc. (September 9); Wallasey U.D.C., £4,720, for extension of refuse destructor works (September 10).

Barnstaple.—The following plans have been passed by the Town Council:—Four cottages, Carlyle Avenue, for Mr. J. Rice; house, Sticklepath Hill, for Messrs. Slee and Son; Nos. 38 to 44, Charles Street, for Messrs. Cooke and Sons; alterations to conveniences at Bridge Chambers for the Bridge Trust; erection of a coal store, Raleigh Park, for the Water Company; four cottages, Kingsley Avenue, Yeo Vale, for Mr. J. Hill.

Belfast.—The L.G.B. have held an inquiry into the application of the Belfast R.D.C. to borrow £2,932 for building labourers' cottages, including cost of land, fencing, etc. The inspector intimated the objection of the board to a cost of £195 for each cottage, the idea being that the cost should not exceed £170. The question of reducing the cost is to be brought before the council.

Birstall.—Plans have been approved for the erection of sixteen first-class cottages on the Leyland estate by the Birstall Co-operative Society. The Carr House estate in Bradford Road is to be developed by a local firm of contractors, a start being made with two terraces of houses.

Blackburn.—Sir W. H. Hornby, Bart., M.P., has had plans prepared by Messrs. Briggs and Wolstenholme for the construction of a miniature rifle range at Brookhouse, Blackburn. The building will comprise a wide hall, with armoury and cleaning-room, lavatory accommodation, and small magazine-room. The range is to be 170ft. long by 40ft. wide

[*Photo: "The American Architect."*

THE UNION STATION, WASHINGTON, D.C.: THE PRESIDENTIAL ENTRANCE. D. H. BURNHAM AND CO., ARCHITECTS. (*See centre plate.*)

and 26ft. in height to the underside of the ridge, the roof being carried by steel principals. At one end, facing the targets, will be a small balcony approached by way of two staircases.

Buxton.—The U.D. Council are considering an extension of the baths.

Halifax.—Plans for the following new buildings have been passed:—Twelve houses, St. Bevan's Road, for Messrs. Shaw Bros.; 2 houses, Trimmingham Lane, for Messrs. E. and P. Wadsworth; and 12 houses, St. Anne's Road, Skircoat, for Messrs. W. and E. Richardson.

Hastings.—The guardians are about to erect a nurses' home, at a cost not exceeding £2,565, of which they are seeking to raise £2,500 by loan. The plans have been approved by the Local Government Board.

Hay.—A memorial to the late Archdeacon Bevan has been proposed, and public subscriptions are to be invited at a meeting to be held shortly.

Lee, Kent.—Representatives of a syndicate have been inspecting various places in Lee and Lewisham for sites for a proposed "Temple of Pleasure."

Llandudno.—Mr. G. A. Humphreys has submitted for the consideration of the building committee his sketch plans for the proposed Carnegie Free Library.

Luton.—At a meeting of Luton town council on September 1st, it was announced that Mr. Andrew Carnegie had promised £10,000 towards the building of a free library.

Manchester.—The City Council on September 2nd decided to apply to the Local Government Board for power to borrow £50,000 for permanent works, road-making, and laying out of parks. It was urged that exceptional measures were necessary in order to meet the antiicipatd distress from unemployment during the coming winter.

Ramsey, Hunts.—Lord De Ramsey is proposing to extend the reading-room at Ramsey at his own expense. The new room, which will be devoted to cards, chess, etc., is estimated to cost £300.

St. Pancras.—The Borough Council having applied for permission to modify the scheme to provide dwellings on the Prospect Terrace Area, Gray's Inn Road, so that 352 persons may be housed on the site, instead of the 144 persons originally proposed, a Local Government inquiry was held on August 23rd. Messrs. Joseph and Smithem are the architects.

Shrewsbury.—The Museum and Free Library Buildings are to be repaired, at a cost of about £1,000. Towards this the Shropshire Horticultural Society has given a sum of £500.

Sidmouth.—The U.D.C. propose to erect another bridge over the river Sid, at the bottom of Laun Vista.

Stafford.—It is rumoured that a new General Post Office is to be erected on the site of Messrs. Nevill's Yard, between the Green Bridge and the junction of the Newport, Lichfield, and Wolverhampton Roads.

Buildings in Progress and Completed.

Anston.—A new elementary school, erected here for the Yorks West Riding Education Committee, was opened on August 29th. The new building, containing a central hall with seven class-rooms—the accommodation being for 420 scholars—has cost £5,000.

Birstall.—The building trade here is fairly brisk. Messrs. J. and W. Nelson are erecting twenty-four houses in Leeds Road; Councillor A. Wallis has erected three houses and a shop in Low Lane; and six houses have been built in Huddersfield Road for Mr. J. Brooksbank. The new Roman Catholic church, and a new Sunday-school in connection with St. Mary's Mission at Howden Clough, are also in course of erection.

Bishop's Stortford.—An organ gallery is being constructed over a new entrance porch at St. Joseph's R.C. Church, Windhill, and when completed the organ will be removed from its present position to the new gallery. Other improvements to the church are also in contemplation.

Bolton.—The Empire Theatre and Hippodrome here, which was opened on August 24th, has been built by Mr. Thos. Hargreaves, of Rochdale (who is the proprietor), from designs by Messrs. Butterworth and Duncan.

Clandon.—A new small-pox hospital, which has been erected here by the Surrey Small-pox Hospital Committee, at a cost of £15,000, provides for the needs of a population of 432,000, excluding the Guildford, Croydon, and Richmond districts, which already have accommodation for this disease. The plans were prepared by Mr. F. G. Howell, the late County Surveyor, with the advice of Dr. Seaton, Medical Officer for the County. There is accommodation for eight women and six men, while there are two beds for special cases, and an isolation ward with three cubicles for men and two for women. The hospital has its own laundry, disinfector station, and mortuary, and the sewage is treated in a hydrolytic tank system devised by Dr. Seaton. Three concrete plateaux have been constructed in the grounds, on which temporary iron buildings may be quickly erected in case of an epidemic. About 5,000 young trees have been planted in the grounds.

Doncaster.—The tender of Messrs. H. Arnold and Son, Doncaster, has been accepted by the Town Council for the building of the Marsh Gate bridge.

Gerrard's Cross.—A new Free Methodist Chapel, of corrugated iron, has been erected here by Messrs. Cooper, of London, at a cost of £400. The foundation work was executed by Messrs. Bailey, of Gerrard's Cross.

Hales Owen.—The Worcestershire Education Committee are about to erect a new elementary school here. Messrs. Guest's tender for £7,250 was accepted for the work.

London.—Christ Church, Blackfriars Road, is now being repaired at an estimated cost of £1,500. The building has been in danger of collapse owing, it is said, to excavation, tunnelling, and drainage works in connection with sewers, tube railways, and factories, which have undermined the foundation. The church is an interesting structure erected in the eighteenth century.

OF THE
UNIVERSITY OF MADRAS

were opened on the 2nd inst. The church, which seats 600, has been erected from the plans of Mr. A. Forrester, Middlesbrough, whose design was accepted in a limited competition.

Much Hadham.—The church organ is being rebuilt by Mr. Halliday, organ builder, of Holloway.

Nottingham.—The steel-work in the new Hippodrome, with which rapid progress is being made, was tested last week, under the supervision of Mr. Arthur Brown, the City Engineer; Mr. J. E. Webb, the City Building Surveyor; and Mr. G. Endsor, steel draughtsman in the City Engineer's Department. The test was made by loading the circle and gallery tiers with bags of material corresponding approximately to the aggregate weight of an audience in those parts of the house. The steel-work, which came very satisfactorily through the test, has been constructed by Messrs. George Sands and Son, of Colwick, under the supervision of Mr. John Price, the Consulting Engineer, of Workington. The auditorium is 85ft. wide and 80ft. deep, and the circle contains 12 rows of seats.

Oadby.—The new almshouses of the Worshipful Company of Framework-Knitters were inspected by the Master, Mr. Alfred Corah, and a number of guests, on August 29th. The houses will be opened on October 26th. The old almshouses of the Company were situated in the Kingsland Road, London, but they were disposed of so that new homes might be built in country surroundings in Leicestershire, near to the hosiery trade centres of Nottingham and Leicester. Eleven cottages have been built on a site of four acres, there being a lodge at the entrance gates. The rooms are on one floor; they are light and airy; and are decorated with distemper in various tints. Each dwelling possesses a bath and a good scullery, and has a small garden. The grounds generally are being laid out as a small park. It is proposed to build a flat for old men with few friends, so that an attendant can look after them.

Perth.—The new Guild Hall, which was opened on August 29th, stands on the site of the old hall, which was demolished last year, after doing duty for more than a century. Two features of the old hall—namely, a decorated panel with the town arms, and framed panels, containing the names of benefactors of the Guildry for the last two hundred years—have been preserved. The work has been carried out under the supervision of Mr. A. G. Heiton, architect. The building contractors were Messrs. Fraser and Morton, Perth.

Redhill.—The new Horley Mead mixed school for 320 children was opened on August 26th. The buildings, of red brick with stone dressings, are on the ground level, the class-rooms being ranged round a central hall. The architects were Messrs. T. R. and Vincent Hooper, A.R.I.B.A., of Redhill; the general contractor being Mr. E. Worssell, of Redhill, and Mr. A. J. Amos was clerk of the works. Mr. T. Penfold, Reigate, supplied the stone-work; Messrs. Tamplin and Makovski, Reigate, executed the electric lighting; and Messrs. Haden and Sons, of Trowbridge, carried out the heating and ventilating.

Shirebrook.—A new Roman Catholic church in Langwith Road was opened by Bishop Brindle, D.S.O., of Nottingham, on August 29th. The building, which has seating accommodation for 360, has cost £2,200.

Our Plate.

We are enabled to give this week several views of the New Union Station at Washington, D.C., U.S.A., a building that has aroused considerable interest from the time the first sketch drawings were available. It is unfortunate that our own railway companies afford architects so few opportunities of designing their termini in such a fine monumental manner. Messrs. D. H. Burnham and Co. are the architects.

The Royal Commission on Sewage Disposal has just issued its fifth report, to which we hope to be able to give attention in our next week's issue.

* * *

With respect to the elevation and plan of the National Bank Building, Durban, Natal, which appeared on p. 31 of our issue of July 8th, where it was stated that Mr. Reginald G. Kirkby, A.R.I.B.A., was the architect, Mr. Clement H. Stott, M.S.A., etc., writes from Pietermaritzburg to inform us that the firm of Messrs. Stott and Kirkby should have been given as the architects, and that, Mr. Kirkby having left the Colony, the work has been completed under the supervision of Mr. C. H. Stott.

* * *

Mr. Frank Williams, of Hooley Villas, near Merstham, Surrey, will give a demonstration of his patent "Gripall" floor cramp at the "Builders' Journal" Offices, Caxton House, Westminster, on Thursday, September 17th.

Correspondence.

Out-of-work Architects.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Some time ago I sent a letter to one of your contemporaries suggesting that, in view of architects' registration, it might be possible to regulate the composition of an architect's office staff. For instance, an architect might not be allowed to employ a larger number of pupils than of draughtsmen. Your contemporary refused to publish my letter.

Something very much akin to this subject has been touched upon in your leader of last week, and in connection with this I would like merely to point out one instance which came under my notice. A certain F.R.I.B.A. in London made use of the five letters following his name to induce wealthy gentlemen to send their sons to him with a large premium. One pupil was admitted each year, and the office "staff" consisted of four pupils. At the end of four years the pupil was no longer required. This F.R.I.B.A. was in the habit of going in for competitions, and at such times would advertise for a draughtsman well up in some special class of work. One draughtsman was engaged in this way, and made his way from the far North to London. The competition drawings were completed in two months, and the draughtsman was then discharged; but before he left another draughtsman had arrived—also from the far North, to prepare drawings for another competition of a different nature. The F.R.I.B.A., after all, decided not to go in for this second competition, both draughtsmen were discharged, and the four pupils were left to

THE UNION STATION, WASHINGTON, D.C.: THE ENTRANCE PORTICO.
D. H. BURNHAM AND CO., ARCHITECTS. (*See Centre Plate.*)

carry out the "work of the office" until another suitable competition should turn up.

Possibly this sort of thing has something to do with the scarcity of vacancies for draughtsmen.—Yours truly,

A.B.I.R.F.

Tall Chimney Construction: An Epoch-making Invention.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The serial in your columns on this subject, though admirable, does not seem to embrace all the latest varieties, although it gives an exceedingly good description of the most noted ones. For instance, I may be allowed to mention a notable example that has just been erected in Brussels. In this, moulded concrete blocks of unique design envelope a skeleton metal reinforcement. The advantages thus obtained are—speed of construction (I believe that this example occupied, in actual execution, but little more than a month, from pile foundation to cap top); adaptability of the concrete block to a diminishing diameter from base, giving an exceedingly graceful and stable construction; a perfectly smooth interior; and an architectural appearance that is sadly wanting in the more common type of reinforced chimneys. This last consideration should appeal strongly to mill or power-house architects, who strive to give to reinforced concrete a beauty that most emphasises to the eye its peculiar characteristics.

I find, from an old work on the Monier system, that small smoke-stacks for industrial purposes have long been manufactured in section-lengths, with bell and spigot joints, and that when erected they are guyed similarly to steel stacks. Perhaps the latest invention in this kind, which has been recently introduced on the Continent, will give us section-lengths of chimney forms that can be easily and rapidly erected in a few days after the base containing the smoke flues is completed, and that will be capable of sustaining the superimposed weight of the stack proper. This reference is to the method of forming concrete shapes by centrifugal force. This procedure is already adapted practically to the construction of telegraph poles, etc. The inventor is Hermann Rentzsch, of the firm of Otto and Schlosser, of Meissen, Saxony. The invention is protected under the short appellation of "Schleudermast," or "slingmast." The process simply consists of whirling a semi-fluid mixture of fine concrete, intimately mixed with asbestos fibre, in a hollow form or mould, which, under the action of centrifugal force, causes such mixture to fly outward to the enclosed metal reinforcement, which has been placed beforehand in the mould; the less dense particles of residual water, etc., being confined to the inner circles of rotation, and afterwards removed by draining away such. In this way a concrete shape of greater density at its greatest diametrical perimeter is obtained. The practicability of this unique invention is by no means confined to the manufacture of telegraph and other poles, but it gives a ready means of making other shapes. At all events, builders can now count upon this method for the construction of concrete columns (plain and ornamental) in their entire length, ready for immediate erection in the building; a considerable saving being thus effected with respect to the cost of form-work and of filling in. I think that this invention must certainly rank among those that may be truly described as epoch-making.

Yours truly, JAMES A. SMYTH.

THE R.I.B.A., THE IRISH INSTITUTE, & THE ULSTER SOCIETY.

The Case for the Ulster Society.

In accordance with a promise given in last week's issue, we now produce what we assume to be the salient points made on behalf of the Council of the Ulster Society of Architects by its hon. secretary, Mr. N. Fitzsimons, F.R.I.B.A., who traverses certain statements made in an article in "The Irish Builder," from which extracts were made in our issue of July 29th. Mr. Fitzsimons's arguments may be thus summarised:—

(1) The Royal Institute of *British* Architects is obviously not "an *English* Institution," nor are its character and by-laws "the purely domestic concerns" of *English* architects; they are the concerns, primarily, of its Fellows and Associates in all parts of the globe, and, secondarily, affect all qualified architects, irrespective of membership, whose interests the Institute of British Architects claims to represent also in Great Britain and Ireland.

(2) Such action as has been taken on behalf of the Ulster Society was taken by Fellows and Associates of the Royal Institute of British Architects, and they are not prepared to admit that they have nothing to do with the affairs of the Institute of which they are members.

(3) The relationship of the Royal Institute of the Architects of Ireland to the Royal Institute of British Architects is that of an "allied society," precisely on the same terms as any of the other English or Scottish provincial societies are allied societies. The Irish Institute, as a body corporate, is not entitled to have "a representative of Ireland" on the Council of the British Institute, although such may be elected by vote of the Fellows and Associates of the British Institute, as one of the nine members of Council representing provincial societies, out of sixteen from which the selection may be made.

(4) The statement that "the British Institute has always recognised the status of the Irish Institute as representative of the profession in all Ireland, and the entire country as its sphere of influence," is untrue. By reference to the Kalendar of the British Institute, 1900-01, p. 185, it will be seen that as an allied society the Irish Institute is given, "until the development of *local* societies," the whole of Ireland for its province.

(5) It is misleading to say that the Ulster Society was founded under the auspices of the Irish Institute. The movement was a local one, and Sir Thomas Drew was requested, as being both President of the Irish Institute and Member of Council of the British Institute, to convene the first meeting. As Member of Council of the British Institute, he explained the desire of that body to have an organisation of the profession in the North of Ireland on the lines laid down in the Kalendar. The Society was thus formed on the distinct understanding that it should, as soon as fully organised, be accepted as an "allied society" by the British Institute. But the leading spirits in the promotion of the Ulster Society being anxious that a close working alliance for the common good should be formed with the Irish Institute, the by-laws were framed in such a way as to induce architects to join the Ulster Society through the Irish Institute, although the qualification for membership of the Society was higher than, at that time, required by the Institute. This alliance the promoters have since had cause to regret, as, owing to the position taken up by the Institute, the alliance soon proved absolutely unworkable. Sir Thomas Drew was elected first President of the Ulster Society solely because he was at the same time a distinguished architect and an Ulsterman practising in the province.

(6) When, in pursuance of the understanding at the initiation of the Ulster Society, a scheme for alliance of the Society with the British Institute was brought before the Council of the Irish Institute by the *two* representatives of the Society thereon (and not one only, as incorrectly stated), the Society discovered, by the antagonism of the Irish Institute, that the latter regarded neither the prior understanding nor the welfare of the Society, but merely its own importance, which the scheme appeared to menace. Purely with a view to obviate any unpleasantness, the Society acquiesced in deferment of the scheme.

(7) The Ulster Society was, in a manner that can only be characterised as deliberately, insulted, in the person of its President, who, by the request of the Council of the Irish Institute, allowed his name to be put in nomination for a Fellowship, to be ignominiously rejected. Severance of the alliance was the only answer that could be given.

(8) The suggestion that the question of fees was the instance of the severance is a misrepresentation of the facts. The scale referred to as having been adopted by the Ulster Society is as follows:—"Where buildings are of a very plain description, in the nature of warehouses, stores, or shedding, involving less than the usual trouble in design and drawing, and where no special construction has to be adopted to render them suitable for machinery or otherwise, a minimum charge of 4 per cent. may be made, and in no case is any less charge to be made, except under specially exceptional circumstances, the amount of which is to be regulated only on application to the Council of the Ulster Society of Architects, setting out fully the facts, in which case, if the Council so decide, a further deduction may be made of the amount which it may consider fair under the circumstances." Previous to its adoption, competition amongst architects had induced acceptance of fees considerably under the earlier standard; and it was felt that the scale must be made compulsory, so far as members of the Ulster Society were concerned. It was admitted that there is a certain class of work of a very plain character for which 5 per cent. was excessive but that for such the conditions should be carefully defined, and a rigorous minimum fixed. The proposal of the Society prior to action, was brought before the Council of the Irish Institute by an Ulster member as a matter of courtesy, and it was assented to that 5 per cent. could not be obtained for the class of work described, and that, if a less sum were not taken, the work would go out of architects' hands altogether. Subsequently an attack was made on the proposal of the Society at a meeting at which no representative of the Society was present.

The above paragraphs have been slightly condensed, and some expression of opinion have been omitted. Controversial matter is apt to run to undue lengths (as well as to undue heights and depths), and we prefer to see our columns more usefully occupied.

CONCRETE AND STEEL SECTION.

(MONTHLY.)

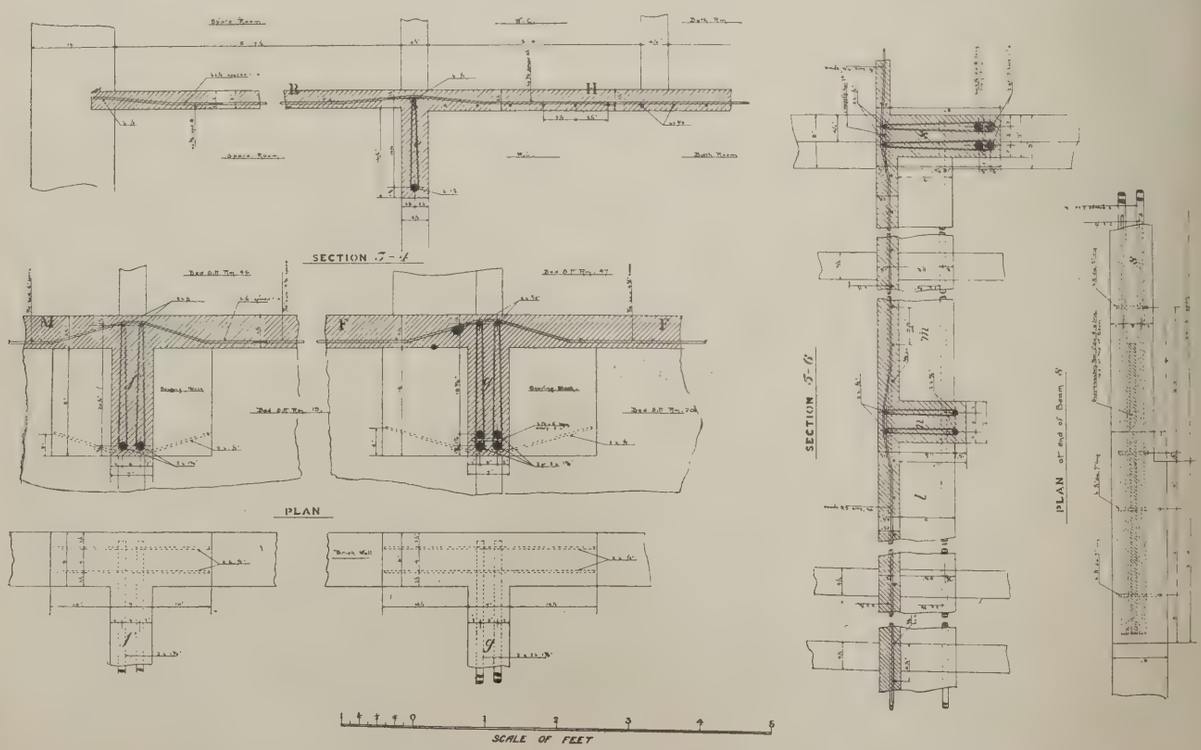
London's By-laws for Reinforced Concrete.

The progress of reinforced concrete construction in London has been much hampered by the London Building Act; indeed, the building by-laws throughout the country have stood in the way of progress in regard to many forms of construction in which there are great advantages. Specialists have continually railed against these restrictions upon trade, but the professional public appear to have allowed interest in the matter to lapse to some extent because of the apparent futility of efforts made to secure revision in such matters. The Royal Institute of British Architects and other bodies have made recommendations to the London County Council for the alteration of the by-laws, so as to allow of the construction of steel-frame buildings in London. The London County Council has promoted Bills in Parliament to enable them thoroughly to overhaul, revise, and improve the London Building Act, but these Bills have had to be withdrawn because of opposition. The Council has very little power, under the present legal enactments, of permitting the construction of buildings by new methods. It can permit the erection of steel-frame and reinforced concrete buildings as temporary structures, but building owners are naturally averse from erecting expensive buildings without any surety that they will be permitted to stand. The present by-laws control to a considerable degree the interior construction of buildings, and the chief application of reinforced concrete in London has been in this direction—namely, for the construction of floors and interior columns. But the full advantages of both steel-frame and reinforced construction are not permissible of adoption, because the walls have to be as thick as with old-time methods of construction. Where the loads are entirely carried by a framework of steel or of reinforced concrete, the walls merely become panels, and may be made of small thickness, and of uniform thickness from top to bottom if need be. The chief advantage, of course, is in the direction of economy. It is known to our readers that there are some corporations to which the London Building Act does not apply, and, upon many sites in London, reinforced concrete has been extensively employed by railway and dock companies, and by the Government. The officials of the London County Council are, therefore, fully alive to the advisability, and, indeed, the necessity, of revising the Building Act in respect to promoting the adoption of new and improved methods of construction which have been in process of evolution for the last few years. At the last meeting of the London County Council before the recess, the Building Act Committee brought up the following report:—"In accordance with the undertaking given in the Council by our chairman, we have carefully considered the question of the amendment and consolidation of the London Building Acts. We are of opinion that the existing building laws of London require amendment in several directions, and that there is a pressing need for their consolidation, but we do not see our way to recommending the Council to deal with the important questions involved until some definite decision is come to with regard to the Housing and Town Planning Bill, now before Parliament, and, if the Bill become law, until the Council has had an opportunity of considering the effect of its provisions. The Bill as it stands not only affects Part II. of the London Building Act, 1894, which regulates the formation and widening of streets and the erection of buildings abutting upon streets, but possibly other parts of that Act. In the circumstances, we think that it would be useless to attempt to promote legislation in the next Session of Parliament for the general amendment of the Building Act, though we propose proceeding with the consideration of the general question at the earliest possible moment. There is, however, one important matter which should be dealt with in the Session of Parliament of 1909, viz., the use of steel construction and reinforced concrete in buildings. This method of construction was not contemplated in the Act of 1894, and there is no doubt that a change of the law in this direction is necessary in order to meet modern building requirements, and we have been strongly urged by the Royal Institute of British Architects, the Institution of Civil Engineers, and the Surveyors' Institution to promote legislation with that object. Under the London Building Act, 1894, the walls of all buildings must be of the thickness prescribed by the first schedule of the Act, with the effect that the walls of buildings mainly constructed of steel or reinforced concrete have to be of a greater thickness than is necessary for stability, thus unnecessarily diminishing the floor-space of the buildings." The report concludes with the following recommendation:—"That application be made to Parliament in the Session of 1909, with a view to the amendment of the London Building Act, 1894, so as to facilitate the use of steel or reinforced concrete in the construction of buildings, and to make any necessary provision with regard thereto." It is obvious, therefore, that certain members of the staff have been engaged upon the drafting of regulations for reinforced concrete and steel-frame construction. We trust, however, that the mistake of keeping their proposals secret until the Bill is placed before Parliament—a mistake that has been made by the London County Council in its previous attempts to get the London Building Act improved—will not be again made. The proposed amendments or new regulations should be placed before the professional societies concerned for full consideration, and their suggestions should be attended to, and if necessary conferences should be held between the representatives of the societies concerned so as to come to a compromise before the London County Council submits its Bill to Parliament. In this way really serious objections would be met, and professional men would be fairly well satisfied. We cannot understand why officials should so often regard the public—whom they are supposed to serve—as malefactors who are seeking to do injury to themselves and others. Whereas constructional specialists may be open to some little suspicion of trying to push their systems into undue prominence, or to secure undue advantages in their favour, and perhaps may occa-

THE WOMEN'S HOSTEL, BIRMINGHAM: VIEW OF SECOND FLOOR DURING CONSTRUCTION ON THE COIGNET SYSTEM.

THE WOMEN'S HOSTEL, BIRMINGHAM: THE DINING HALL.

sionally boom unsuitable methods of construction, the architects and engineers of this country are desirous of promoting sound and efficient construction, and surely the officials should not try to ride roughshod over them, but should endeavour to work harmoniously with, and to defer to the opinions of, their elected representatives, such as the councils and committees of the professional societies, etc. If municipal bodies, in drawing up new proposals for amending by-laws, will only meet the professional societies in an open manner and consult with them, we feel sure that work of very great utility can be done, and the construction of buildings in the future can be materially improved, while the cost of building operations to the community might be reduced by many millions of pounds per year. A thoroughly sensible model Building Act for London would do inestimable good in serving as an example for all other centres in this country, and especially for municipal authorities at home and abroad. It is within the power of the officials of the London County Council, and of the London Building Act Committee, to win great credit for themselves by solving what is a serious problem, which they can do by calling to their aid the architectural and engineering professions.

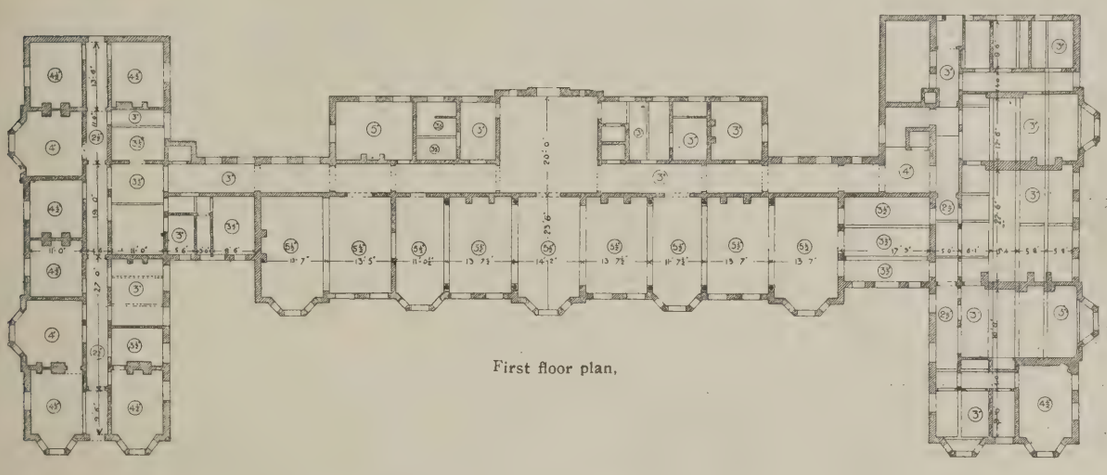


WOMEN'S HOSTEL AT BIRMINGHAM

This building is a sort of superior Rowton House for Women. One of the features of the building is a large dining hall, of which we give a photograph showing columns in reinforced concrete supporting the main beams.

We, in addition, publish the front elevation, a section and plan of the first floor, and a photograph showing the second floor in course of construction, in which the main and secondary reinforced concrete beams and the meshwork of the slabs come out plainly. We also give a detail of the reinforced concrete floor construction.

The building is being erected quite close to the Birmingham University, and is now nearing completion. The architects are Messrs. Buckland and Farmer, of Birmingham, and the contractors are Messrs. Richard Fenwick, Ltd., also of Birmingham, who are licensees for the Coignet system of reinforced concrete construction, which is employed throughout for the construction of floors and columns, as also for an elaborate main staircase. The outer walls are of brickwork. The total area of flooring amounts to about 13,000 sq. ft. The floors have been designed for a superimposed load of 1 cwt. per sq. ft., and to show a minimum of projecting beams. The best materials have been used, including Leighton Buzzard sand.



Various floors were recently tested before a large assembly of Birmingham architects who had responded to a special invitation. Although the deflection allowed was 1/600 of the spans, the deflections recorded in several of the beams only amounted to about 1/2000. In one particular case the entire surface of the floor, measuring about 30ft. by 30ft., was loaded, and the deflection noted was not above 1/2000 of the span of each beam.

Views and Reviews.

The Practice of Concreting.

The first edition of Mr. Potter's Treatise of Concrete was published in 1877. A second edition in two volumes was issued in 1891. Now, after 17 years' further practical and continuous experience, the author has issued a third edition of the work in one volume. The book records opinions resulting from 39 years' practical experience, and is a most valuable work. Mr. Potter expresses his conclusions and opinions straightforwardly, and he admits that they do not always coincide with the views of other practitioners; but, being the result of such wide experience, they must carry great weight. We feel that the objections that may be made will seldom rest upon Mr. Potter's facts and conclusions, but upon his attempts to find scientific reasons for them. A famous judge once advised a newly-appointed judge to give his conclusions but never his reasons, for the former might be right, whereas the latter would very likely be wrong. This allusion is perhaps hardly fair to Mr. Potter, but it gives some idea of what we mean. The nature of cements and aggregates varies so much under various conditions, the manufacture of the former has been so much altered in accordance with the requirements of engineers and chemists and by improved methods, that it is very difficult to trace thoroughly the reasons for any phenomena. The results of practice are, however, very different to laboratory experiments, and Mr. Potter's experience and conclusions are very valuable as a general guide for users of cement, and this work deserves to be carefully and closely studied by all interested in the subject.

Mr. Potter has completely recast the book; the chapters and the treatment are very different to former editions, much additional information has been added and the older matter thoroughly revised; the type has been entirely reset and is very clear. In the second edition there was much information upon the history of the subject. This has been gathered together by Mr. Potter and put into much better shape in this edition, and forms one of the most interesting features of the work. He says in his preface: "It will be found that concrete in the abstract, and many applications which are assumed to be of quite a novel character, bear out the old adage that 'There is nothing new under the sun,' which is quite true." Reinforced concrete—the subject of the moment—is in nowise different in this respect, as Mr. Potter shows. He might have extended the information, because he hardly gives proper weight to the work and ideas of some pioneers, for instance, W. B. Wilkinson, of Newcastle, François Coignet, and Brannon. There are also misprints in respect to the names "Lecomte" and "Thusane" (*sic*). The book merits great praise, and deserves to be considered a standard text-book on the subject of practice in concrete work. It is interestingly written and well illustrated. The author is a pioneer in concrete work, and one of our greatest authorities on the subject.

"Concrete: Its Uses in Building." By Thomas Potter. Third Edition, revised and enlarged. London: B. T. Batsford, 94, High Holborn, W.C. Price 7s. 6d. net.

FORMS FOR REINFORCED CONCRETE.—II.

(*Continued from p.* 120, *No.* 705.)

At the conclusion of the first part of this article we referred to the attention which was directed a good many years ago to the construction of concrete walls *in situ*. This seems to have had its origin in the efforts of Mr. Tall, a bricklayer, who took out patents in 1865 for a form of shuttering for constructing monolithic concrete walls. He used a wooden frame with movable panels, very similar to those which we have described, and great attention was attracted to his method by a commission from the Emperor of the French to build several concrete cottages at the Paris Exhibition in 1867. Tall managed to advertise his methods in various ways, and sold a number of his patented appliances. His success brought others into the field. Osborne's apparatus was somewhat similar to Tall's. Drake's apparatus was constructed of sheet-iron rivetted on a framework of angle and T-iron. Lish's framework was also made of iron. The absurd statements made by these early pioneers as regards strength of concrete and the want of knowledge displayed by users resulted in a number of accidents, which brought concrete into disfavour, and the material had a decided set-back as regards its use for the construction of walls. The regulations which we still find in by-laws requiring the thickness of concrete walls to be one-third greater than a brick wall under the same circumstances were probably the outcome of the disfavour into which the material was brought at this period.

Forms for Beams and Floors.

As regards the construction of forms for beams and floors, we have to consider two main types, namely, where the supporting beams are of steel, and where they are of reinforced concrete. The former is the earlier type of floor construction, and the methods of centering customary are simpler than those adopted where the construction is of reinforced concrete throughout.

As a rule, when the main or subsidiary beams are of steel some method is devised for the suspending of the timber from the joists, so as to leave an unencumbered space below, which gives great convenience in the building operations. A bearer must be placed between the joists upon which the boarding may rest, and this bearer may be suspended by slings from the top, or by brackets from the lower flanges of the joists. Sometimes the bearer is cut to length and placed between the joists, resting on their lower flanges. Fig. 7 shows the former method, and Fig. 8 the latter.

Fig. 7 shows a simple type of centering for flat floors carried on the top flanges of beams.

Centering for similar floors resting on the bottom flanges is shown in Fig. 8. Such centering is easily hung from the joists by hook bolts or other suitable device.

Where an arched floor between joists is adopted, the variation shown in Fig. 9 is often used.

Figs. 8, 9, 10, 11, 12, 13, 14, show various methods of suspending the centering for concrete floors sustained by joists. Fig. 10 was one of the earliest methods adopted in this country.

Fig. 11 shows an improved form of bracket or clip that goes upon the lower flanges of the joists for taking the bearer;

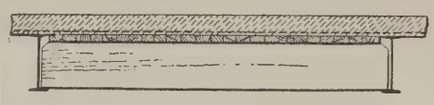

Fig. 7. Form for Slab carried on tops of Joists.

Fig. 8. Form for Slab carried on Bottom Flanges of Joists.

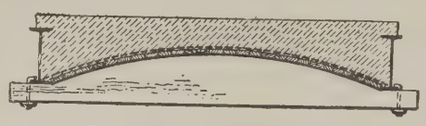

Fig. 9. Form for Arched Floor.

this was recently patented by Mr. Thomas Potter. This type of hanger consists merely of a piece of bent iron, and the panel boards are sustained thereby, or by bearers resting upon these hangers.

Figs. 12, 13, 14, 15, and 16, show somewhat similar methods adopted in Germany.

Fig. 17 shows an arrangement for constructing a reinforced concrete floor where steel joists are used for the main beams. This design is by Mr. William F. Kearns, and is to be commended.

Fig. 18 shows a centering method adopted by the Expanded Metal Co., Ltd., for their channel arch floor, where, again, the centering is supported on the joists.

Sometimes the centering is of a permanent nature, being left in position after the work is completed. We need not illustrate the types of floors in which terra-cotta slabs or tubular lintels are placed between steel beams for sustaining the concrete, as such floors only come within a very wide definition of reinforced concrete. Fig. 20 shows Mr. Thomas Potter's method of using a permanent centering of curved corrugated sheet-iron.

In some systems the boarding is entirely done without, and the concrete retained upon wire meshwork closely woven. Sometimes it is found convenient to adopt such a practice when the centering is of an elaborate character due to the ceiling being moulded, or of peculiar shape. For instance, at St. Charles' College Chapel at Notting Hill, London, constructed by Messrs. D. G. Somerville

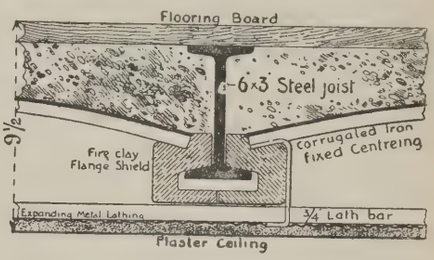
and Co., and illustrated in our issue for March 25th last, a good deal of expense was saved in the centering for the construction of the dome by placing sheets of expanded metal of light lathing quality to form the curved pendentives instead of elaborately finishing the centering. The expanded metal naturally accommodated itself to the proper curve when the weight of concrete came on it.

As regards the second main type into which we have divided the centering, namely, that in which the beams are of reinforced concrete, we find a number of



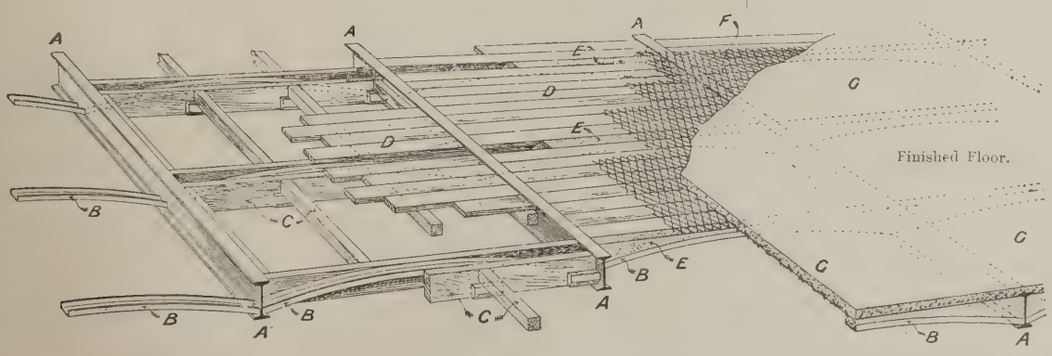


Fig. 20. Permanent Corrugated Iron Centering for Floors.

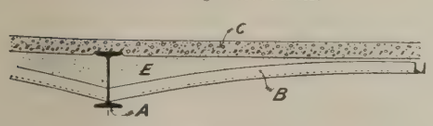

methods in vogue. Not only are the beams of reinforced concrete, but in such construction the columns, as a rule, are also of reinforced concrete. In dealing, therefore, with the construction of the centering for the beams and floor slabs we must consider them in relation to the forms for the columns.

The main difference in this division of our subject is that the whole of the centering is, as a rule, sustained by means of props or struts from beneath. The beams supporting the floor slabs are given shape by forms of the nature of boxes placed between the columns and the walls. The boards for the slabs are laid between these boxes, generally supported by cross bearers or joists resting upon the sides of the beam boxes. The undersides of the beam boxes and the cross bearers are supported at intermediate points by struts,

A—Rolled Steel Floor Girders.
B—Arched Steel Channels.

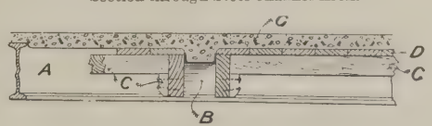

Fig. 18.

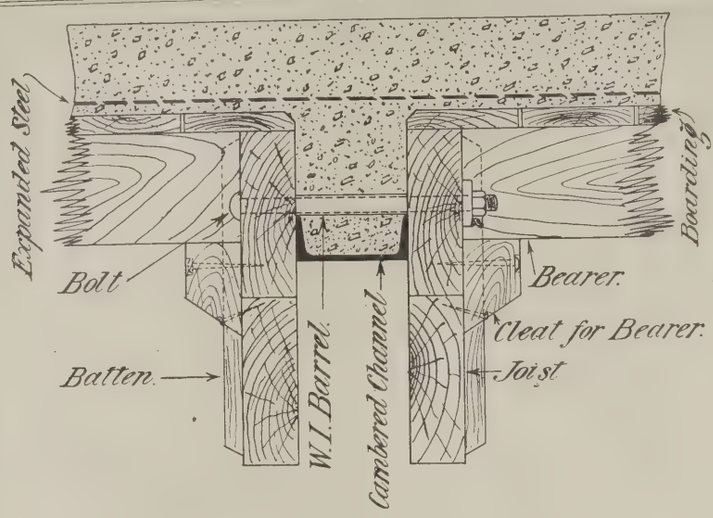

Fig. 18a. Detail of Fig. 18.

though the former rest sometimes at their ends upon the walls or on the column forms, while the ends of the cross-bearers rest upon the beam boxes. There are different opinions about the matter, but, as a general rule, it seems to be considered preferable to use light joists such as 2in. by 8in., or 2in. by 10in. for bearers rather than to use timber which is heavy to handle.

The struts may be vertically upright, or may be inclined, the latter being adopted where it is desired to maintain a clear space underneath. At the top or bottom of each strut there should be hard wood wedges, which are not only useful in setting and removing, but permit of testing to see whether there is any deflection of the beam or slab, which is a provision for safety. These wedges should be loosened 24 hours in advance of the struts.

The undersides of beams are not, as a rule, ornamented with mouldings formed *in situ*. Not only would this add to the cost, but concrete floors are, as a rule, in work where some ornamentation is required, plastered on the underside, the mouldings being run in plaster. To avoid rough edges on the beams, however, and both for the sake of improving the appearance and for convenience in removing the centering, the edges of beams are almost always chamfered; the chamfers are made by lightly tacking small triangular strips of wood in the bottom of the beam moulds or boxes.

Before dealing with the construction in detail of various systems of centering for floors, we may refer generally to the fact that columns in reinforced concrete are always brought up preliminary to the construction of the forms for the beams and the floor slabs. This allows them to set for a little while previous to the construction of the latter.

The beams and the slabs are, as a rule, concreted altogether at one time, the concrete being applied over the whole surface and into beam boxes in one operation, though the concrete is often tamped in the boxes in layers of a few inches in thickness—but the whole work should be done in one operation. It may be mentioned here, that in constructing the centering it is advisable to leave one of the boards in position under each floor slab, and also the bottoms of the beams are very often allowed to remain in position with props under them for some time after the rest of the centering has been removed. If the centering, for instance, has been struck at three weeks, the underside of the beams would be left in position for about another week or two. In designing the centering, therefore, this should be borne in mind.

The sides of all the forms for beams should be held tightly together by wedges or clamps, in order to prevent the pressure of the concrete bringing them away from the bottom boards.

Fig. 21 shows a handy clamp for beam or column forms. Iron clamps are perhaps more employed for column forms, and wood clamps are usually adopted for retaining the sides of beams.

In Fig. 21 the hook is a plain piece of flat iron measuring ¼in. by 1¼in., with the end bent round to form a flat bearing, as shown. The dog is a square piece of iron with one end turned round in the same way, and a hole, slightly larger than the flat iron rod, punched through it. This is tightened by hammering on the lower end, the outward pressure on the boards of the form at the upper end, as shown in Fig. 22, causing it to bind and prevent it slipping back.

It may here be stated that the tops of reinforced concrete columns are usually splayed, so as to form brackets, which virtually deepen the beams over the supports, a detail that must be arranged for in the centering.

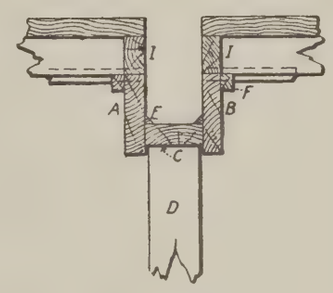

Fig. 23. Cross-section through Main Beam.

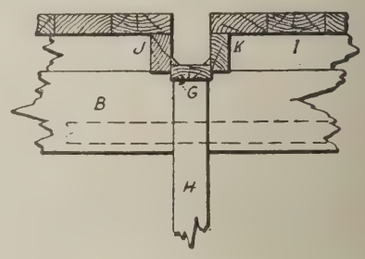

Fig. 24. Section through Secondary Beam, showing form of Main Beam in Elevation.

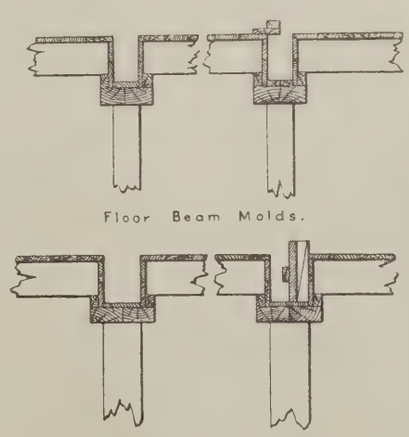

Fig. 25. Forms for affording Expansion Joints.

Figs. 23 and 24 show the type of centering that has been used by Hennebique constructors. B are the side-boards; C is the bottom board, sustained by the prop D; E is a triangular slip nailed to the side-boards to form a chamfer on the soffit of the beam. At the top of the side-boards A and B battens or cleats (F) are nailed to carry the ends of the bottom boards, (G) with the subsidiary beams likewise supported at intermediate points by struts (H). Upper boards (I) are placed on the main girder forms, and on the sideboards (J and K) of the secondary beams. Finally, laggings or top-boards sustain the floor slab. The sides of the beam forms are held by iron clamps, like that shown in Fig. 21.

Fig. 25 shows forms of centering similar to the foregoing, except in regard to the arrangements for producing expansion joints by nailing temporary strips over the beam boxes, these strips being removed after the concrete has hardened, and before the adjoining slab is constructed. Planes of weakness were also provided for in the main girders, and these were produced by building them in two parts in the same mould, by putting a partition board, held in place by wedges, while one-half was concreted, as shown. When the concrete had hardened, the board and wedges were removed, and the second half was concreted.

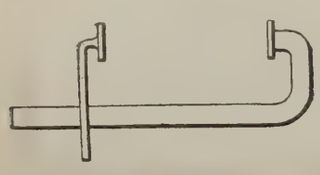

Fig. 21. Clamp.

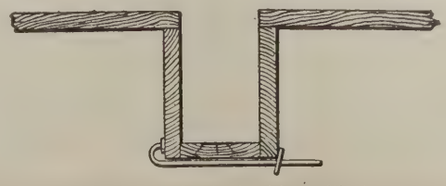

Fig. 22 Showing Clamp fixed in position.

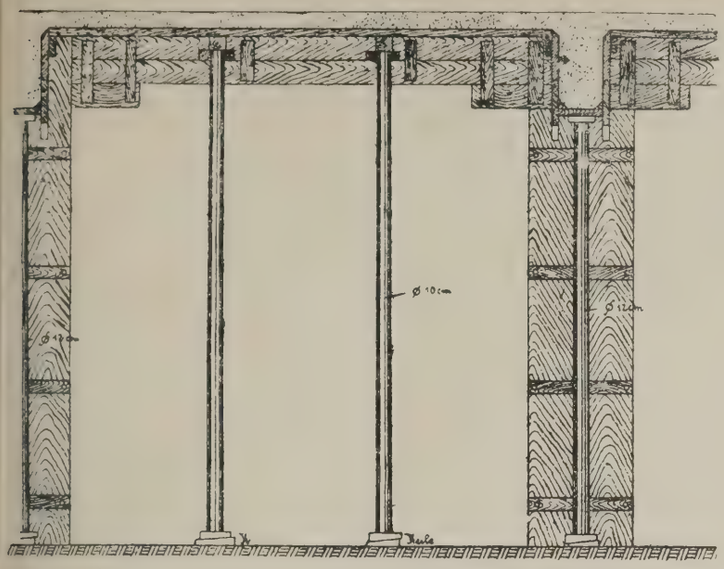

Fig. 26. German Centering.

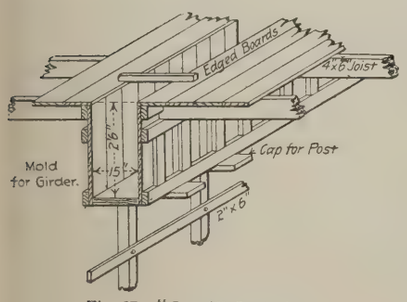

Fig. 27. "Panel" Centering.

Fig. 26 shows a similar method of centering used in Germany. The struts in this case are of round timber. The simple way in which the splays at the tops of the columns are obtained should be noted. Elaboration and finished workmanship in the construction of forms is to be avoided.

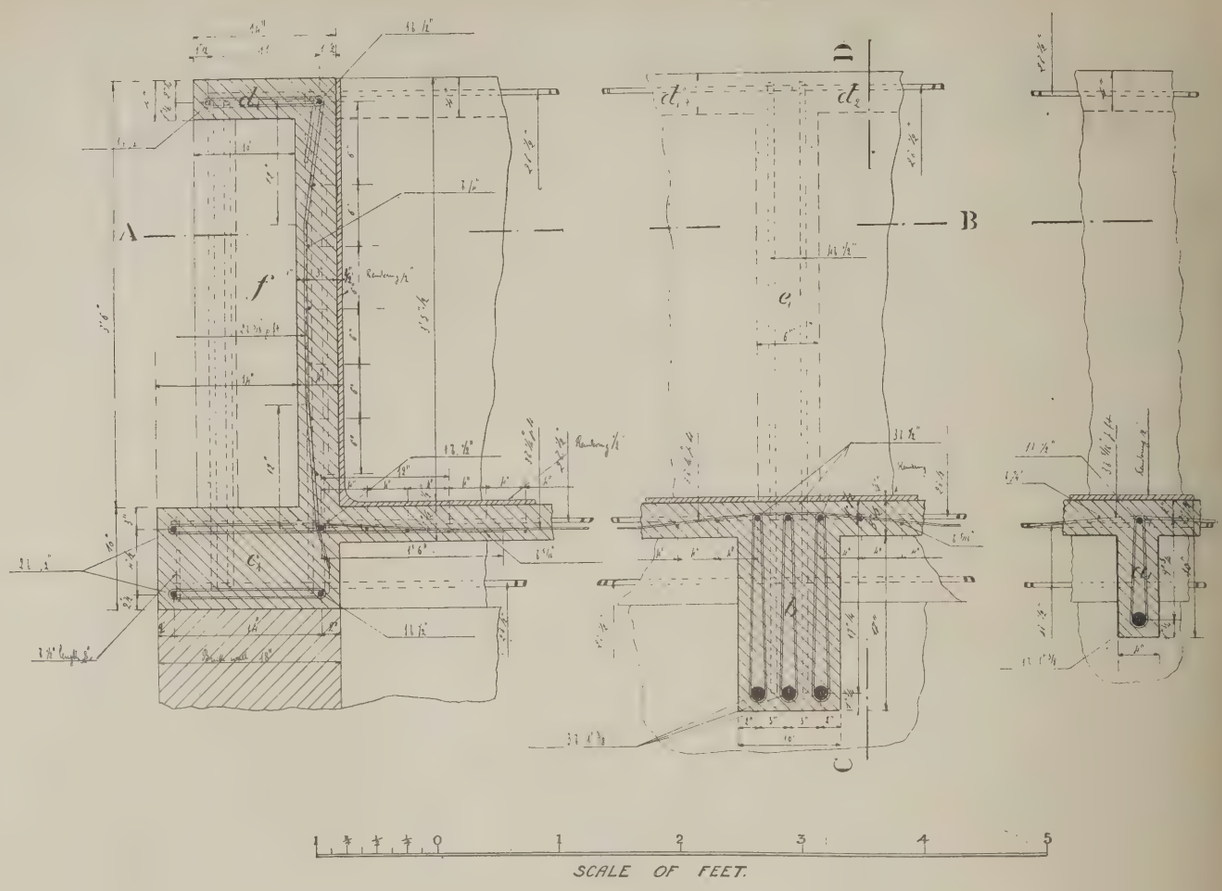
For the construction of floors there are two types of forms, known as the "Core Box" and "Panel" construction. In either case the forms should be so constructed that changes in depths or widths can be made without cutting the forms to pieces. As a general rule, it is more economical to use the panel form for the floor slabs rather than the box type; but, where the beams and girders are fairly uniform, and great speed is required, the box type is preferable to the panel type. Figs. 23, 24, 25, 26, and 27 belong to the panel type. Fig. 27 shows a girder and slab form of the panel type, the construction of which is very clearly shown by the view.

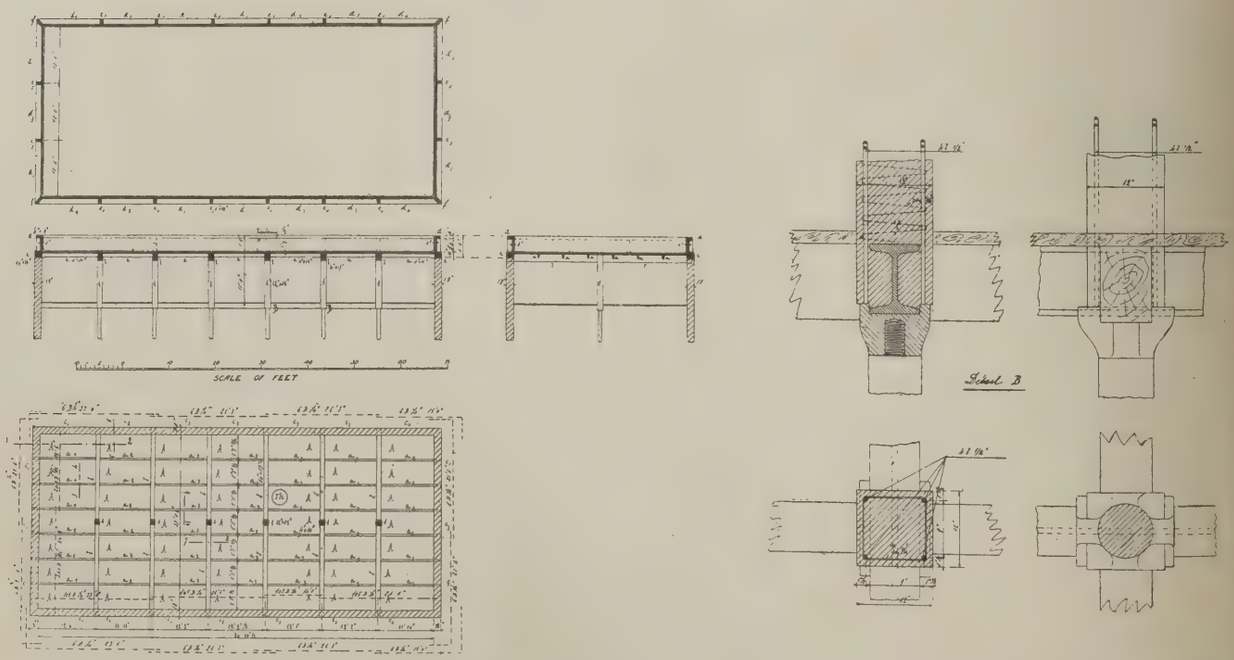
(To be continued.)

Leek U.D.C. have rescinded one of their minutes of the Paving and Sewering Committee to the effect:—"That written notice be given to all architects, builders, and plumbers in Leek that no projection either of spouts, pilasters, window boards, or ornaments of any kind will be allowed which in any degree rest upon or overhang the footpath in any street, and if any such are made proceedings will be at once taken to enforce compliance with the law."

TANK AT WEST HARTLEPOOL.

This tank has been erected for the West Hartlepool Pulp and Paper Company, and was designed on the Coignet system. The dimensions of the tank, and the details of the construction are shown on the drawings. The tank was erected on the top of an old brick building that is used as an engine-house, and before it was built there was a great deal of vibration noticeable, but since the construction of the tank it is a remarkable fact that the vibration has been entirely eliminated. The brickwork could not be depended upon to give equal support to the tank throughout the length of each wall, and therefore a main beam was built along each wall, and reinforced symmetrically, so as to resist tension either above or below if the walls gave slightly at either the ends or the centre. The end main beams were made





General View of the Tank.

TANK FOR THE PAPER AND PULP CO., WEST HARTLEPOOL, ON THE COIGNET SYSTEM. PLANS AND DETAILS.

much larger than those along the sides, because it was desired to make provision for the possible cutting of openings in the walls at a future date. The bottom of the tank is also supported by reinforced concrete stanchions built on top of cast-iron columns, the detail of the connection shown on the diagrams being interesting. It will be seen that the stanchions rest simply upon the iron cap plates without any tie except the grillage of beams and the slab bottom of the tank and the floor below.

We publish an illustration showing an external view of the tank completed, and a view from beneath, showing the underside of the tank.

The contractors and licensees for this work were Messrs. Watt Bros., of West Hartlepool. They have also executed a considerable amount of work on the Coignet system, including a new shop for Messrs. Robinson and Sons, at West Hartlepool, extensive ore bins for the Central Zinc Co., and flooring and panelling for the Skinningrove Iron Works.

TANK FOR PAPER AND PULP CO., WEST HARTLEPOOL, ON THE COIGNET SYSTEM: DETAILS

Concrete and Steel Notes.

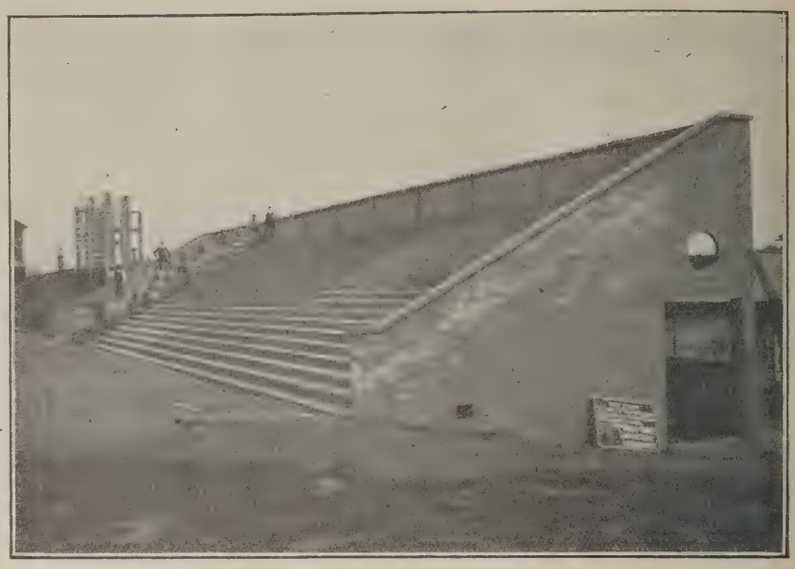
The first steel frame skyscraper on the Broadway, New York, which was of nine storeys only, and for which the plans were filed on April 17th, 1888, or just a little more than twenty years ago, is to be demolished in order to make way for a 38-storey building, which will extend over the original site and on to additional land, bringing the total frontage on the Broadway to 81.9ft., and on New Street to 80.2ft. The new Tower building will be of brick and terra-cotta, and will be provided with thirteen passenger elevators and one for freight. The cost is set down at 3,475,000 dols., or about £700,000. Mr. W. C. Hazlett is the architect of the new building, which will be owned by the Broadway and New Street Company.

The supersession of wood by reinforced concrete and otherwise is the subject of a suggestive communication from New Zealand, where, it is mentioned, there is much difficulty in getting good sleepers for railways. The writer thinks that reinforced slag might be put to this use. Some substance, he observes, would need to be supplied to take the spikes, but this should not be difficult to find. There is also in New Zealand an endless demand for fencing posts, and the price is rising every year. "Americans use reinforced concrete for this purpose. Slag would make a lighter post than concrete, and gate posts might also be moulded into any form and made handsome enough to take the place of stone park gates."

Italy's cement industry, it is reported, is now flourishing and developing, in consequence of the favourable conditions it obtains in Italy as a result of reinforced concrete being employed wherever it may replace iron and steel, and also wood, structures. Notwithstanding the very large output of the Italian works, cement, especially of the higher qualities, is still being imported from abroad, particularly from France—the value of the imports last year amounted to more than £50,000. At present there are in Italy some 20 large companies manufacturing cement, with an aggregate capital of over £1,000,000. The activity in the cement industry is likely, according to a correspondent of the "Times," to increase, as large quantities will be required for the extensive harbour works which have been decided upon.

London County Council's annual report for the year ended March 31st, 1907, which made a somewhat belated appearance on Thursday last, contains very little that is of interest from the builder's point of view. The report of the Building Act Committee is, like the rest of the reports, largely statistical. It sets forth in detail the number of applications under the Building Acts during the year (2,235, of which 411 were refused), the number of dangerous structures reported (3,513), the number of summonses issued against owners (588), the number of works surveyed (35,992), and the fees charged for surveying them (£50,883 3s. 7d.), and so forth. The information given by the Housing Committee, and with respect to other building interests, is of similar character. An appendix affords a useful synopsis of the Acts of Parliament passed in the Session of 1906 giving further powers to the Council.

REINFORCED CONCRETE STAND, YORK RACECOURSE.



The spectators' stand constructed in reinforced concrete which we here illustrate is situated on the York racecourse. This particular structure is known as the "2s. stand," and was erected for the York Race Committee. It is constructed throughout of reinforced concrete, designed on the Kahn system by the Trussed Concrete Steel Co., Ltd., of Caxton House, Westminster, S.W. The details of the design are shown by the working drawings that are here reproduced. The reinforcement employed was Kahn "trussed" bars. The work of construction was completed in six weeks from the date of signing the contract, an example of rapid progress. The contractors for the work of construction were Messrs. William Moss and Sons, of Loughborough, and the architect was Mr. Walter H. Brierley, of York.

The stand was designed for a superimposed load of 1½ cwt. per sq. foot, and the general view shows a test in progress after the completion of the structure. It was loaded with a distributed load of 2¼ cwt. over one complete bay, and the maximum deflection recorded under this heavy load was only $\frac{1}{32}$ in. The steps of the stand are supported on inclined beams sustained by spirally reinforced columns supported in square independent foundations. The ends of the stand are filled in with reinforced concrete walls, but the back is open as shown in one photographic view, a row of stanchions or columns being here plainly visible. The stanchions under the centre of the stand are cross-braced for security.

Reinforced concrete is particularly serviceable for the construction of permanent stands for spectators, and we may here note that three other race stands have recently been dsigned and constructed on the Kahn system by the Trussed Concrete Steel Co., Ltd.

EXPANSION OF CONCRETE FLOORS.

Mr. George Harry Gascoigne, of 47, Victoria Street, Westminster, has patented a block for nullifying the effect of expansion in buildings, having for its object to provide means whereby the ferro-concrete, etc., of buildings with which this device is employed may be enabled to expand without unduly straining the walls or pushing them out of position. The invention consists in arranging a number of blocks of suitable construction, each of which is formed with a breakable nib or extension in an opening in the wall, and at the end or side of the floor or ceiling. In carrying out this invention the safety locks, which may be made of burnt clay, concrete, plaster, or other suitable material, are made channel-shaped for the reception of the floor or ceiling, and are provided with nibs or flanges extending along their length. The blocks are placed in a chase or suitably shaped opening in the wall with their open faces inwards to receive the floor, so that the angular nib is up against the side of the chase. The nibs or flanges are connected to the body portion of the block by a narrow portion or neck to enable the nibs to be more easily broken off should the floor expand. It is claimed that it will be readily understood from the foregoing description that, should any expansion occur in the floor or ceiling due to any cause whatsoever, no damage will be done to the walls of the building.

A NICE POINT IN CONTRACT LAW.

A judgment given by Master Chitty in the High Court of Justice on July 21st, 1908, has now been printed, and a copy has been forwarded to us by a correspondent, who thinks that the matter is of sufficient interest and importance to warrant notice in these columns. Briefly stated, the facts are as follows. A lady employed a builder to erect a lodge and stabling, and the case hinged on the rival claims of (A) the trustee under a deed of assignment of the builder, and (B) the Patent Victoria Stone Company to certain moneys paid into court by the lady client, who thus sought relief against the rival claimants. The main issue to be determined by the Court was, therefore, Which of the two parties, A and B, had the better claim to the money? Among the items in the bills of quantities was this: "288 superficial yards 2½-in. granolithic paving on 4-in. brick foundations, laid complete by the Patent Victoria Stone Company at prime cost 4s. 6d. per yard super." The architect certified that the money for this work (£72) should be paid to the Stone Company, not to the builder. Master Chitty said that if this were an action brought by the specialist against the building owner, the Court, taking an ordinary common-law view of the matter, would have had no hesitation in deciding that the specialist had no claim against the building owner, the specialist being no party to the contract between the building owner and the builder, and therefore having no right to rely on Clause 28 of the R.I.B.A. Contract, by which, in the present instance, the architect was governed. The Court thought, however, that the present case was covered by that of Hobbs v. Turner, in which the Master of the Rolls held that Clause 28 "was obviously framed for this particular class of work." "If," said the Master of the Rolls, "the builder entered into a contract for any of this class of work, he might make himself liable to the tradesman or artist; but as he was acting under the general scope of the contract, he would be acting as the agent of the building owner, and would create priority of contract between the building owner and the tradesman or artist. That could only be got rid of by the tradesman or artist contracting with the builder in such a way as to debar himself from resorting to the building owner. Nothing of that kind occurred here." The effect of that ruling, Master Chitty inferred, "seems to be that if this is a provisional sum, there is, under this Clause 28, a power to compel the building owner to pay these sums to the merchant direct." The Court confessed to having had very great difficulty in ascertaining what a provisional sum is, "and there seems to be," he says, "no very clear understanding in the profession as to exactly what it is, whether it means a sum of money that has to be provided for a particular purpose, or whether it means a sum that has to be provided for a particular class of work that is only inserted provisionally—that is to say, provided the architect requires the work to be done." He thought that the item in dispute was, in substance and effect, a provisional sum. "Here is a contract by the builder to employ these people, and a contract by the building owner to pay the builder so much money for the purpose of his paying it to the Patent Victoria Stone

End Wall.

Longtitudinal Section.

STAND AT YORK RACECOURSE, ON THE KAHN SYSTEM.

Company. There is a provision in the contract by which notice—namely, the certificate of the architect under Clause 28—may be given to the merchant of that purpose, and I am very much inclined to think that the merchant might make out that when he gets the certificate of the architect that this payment is to be made to him, that is a notice of the trust, and entitles him to say to the builder, if the builder has got the money, 'You have got that money in trust to pay me.'" A difficulty in the builder's way was that he could not enforce payment of this sum against the building owner. He is only entitled to pay on certificates, and for this particular item he got no certificate. The Court felt that substantial justice would be done in holding that the merchant was entitled to the money, as against the creditors of the builder. Possibly there may be an appeal. The correspondent to whom we are indebted for a copy of this important judgment contends that the primary reason for fixing a p.c. sum is in order that the architect may have the sole control of the sum given, and of the particular work to which it applies. He adds the obvious truism that while there are architects who prefer to place all the responsibility of the employment and payment of the special artist or tradesman upon the general contractor, and who do not avail themselves of the power given them under Clause 28, there are others who prefer to avail themselves of that clause. It remains to be seen whether, supposing there is an appeal, this judgment is upheld, and whether, in case it stands, it will tend to greater uniformity of practice by the more general adoption of the power that now seems to be given under Clause 28 of the R.I.B.A. Contract Form.

Two misprints that occur in last week's issue have been noted. In the article on "Finishing Verges and Gable Ends," page 161, column 3, in the fifth line, under "Soakers and Cover Flashing," "gauge the lap" should read "gauge + lap." On page 166, column 1, in the sixteenth line from the end of the article headed "Roofing with stone slates," "curved fittings" should read "curved firrings."

"ARCHITECTURE & JOURNALISM,"

This is the title of a booklet, beautifully printed and illustrated, giving an interesting account of the publications issued by this Company. This booklet contains a suggestion, and sets out an arrangement showing how Architects and others can utilise any particular points of interest that they come across in their practice, and thus not only add to their own incomes, but add to the value and practical interest of our papers.

SENT FREE on receipt of a Post Card giving Name and Address of any reader.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

September 10. LOCKWOOD.—Erection of a detached cottage, in Woodside Road, Lockwood. Plans may be seen and bills of quantities obtained at the offices of the architects. Tenders to be sent not later than September 10, to J. B. Abbey and Son, architects and surveyors, 34a, New Street, Huddersfield.

September 10. CARDIFF.—Pulling down and rebuilding Nos. 18 and 19, Church Street, Cardiff, for Cross Brothers (Limited). Plans, etc., can be seen, and bills of quantities obtained at the offices of the architect on a deposit of two guineas. Sealed and endorsed tenders to be delivered not later than September 10, to Veall and Sant, architects, Cardiff.

September 11. ELLAND. — Erection of five houses in Workhouse Lane, Elland. Plans and particulars may be seen at the office of Fred. F. Beaumont, architect, Southgate Chambers, Halifax, up to September 11.

September 11. KENDAL.—Erection of additions to the rear of 100, Highgate, Kendal, for Mrs. Newell. Plans and specifications can be inspected and bills of quantities obtained on application to Stephen Shaw, F.R.I.B.A., architect, Kendal, until September 11, upon which day sealed and endorsed tenders are to be sent to the architect.

September 12. CHOPWELL.—Erection of four houses and shops, for F. Rupp, at Chopwell. Plans and specifications may be seen upon application to the architect. Tenders to be delivered on or before September 12, to D. M. Spence, architect and surveyor, Shotley Bridge.

September 12. YNYSYBWL.—Erection and completion of twelve or more houses at Church Street, Ynysybwl. Plans and specifications may be seen with Wm. May, 13, Robert-street, Ynysybwl, to whom sealed and endorsed tenders are to be sent on or before September 12.

September 12. BIRMINGHAM.—Erection of a fire station for the watch committee of the corporation. Applications for forms of tender and bills of quantities may be made on or before September 12, at the office of the architect, Thomas G. Price, M.S.A., Union Chambers, 63, Temple Row, Birmingham. A sum of three guineas will be required as deposit. Drawings may be seen on and after September 12 at the office of the architect. Fair wages clause.

September 12. TUNSTALL. — Erection of 48 workmen's dwellings, at Tunstall, for the Sunderland Rural District Council. Plans and specification may be seen at the office of Joseph Spain, A.R.I.B.A., architect, 12, John Street, Sunderland, from whom bills of quantities can be obtained on payment of two guineas, which will be returned on receipt of a bona fide tender. Whole tenders only will be received, and must be delivered, endorsed "Workmen's Dwellings, Tunstall," not later than noon, September 12, to J. C. Wilson, clerk to the council, Rural District Council offices, 17, John Street, Sunderland. Fair wages clause.

September 12. MILTON REGIS (Kent).—Erection of an enlargement, to provide accommodation for about 260 scholars, to the council school, at Ufton Lane, Milton Regis, Kent, for the education committee. Plans and specification, prepared by the committee's architect, Wilfrid H. Robinson, M.S.A., may be inspected at the offices of the committee, on or after September 3, between the hours of 10 a.m. and 4 p.m. Any person desiring to tender, and to receive a copy of bills of quantities, must send his name to Fras. W. Crook, secretary, Caxton House, Westminster, S.W., accompanied by a deposit of £1, not later than noon on September 3. The deposit will be returned, provided a bona fide tender shall have been submitted, and not withdrawn. Tenders, on the form supplied, with bills of quantities, in a sealed envelope, endorsed "Milton Regis Ufton Lane Tender," must be delivered to the school correspondent, J. Filmer, Albion House, London Road, Sittingbourne, Kent, not later than noon on September 12.

September 14. STOURBRIDGE.—Erection of a public mortuary in Bell Street, for the Urban District Council. Plans, specification, and all particulars can be obtained upon application to the surveyor. Tenders to be delivered, endorsed "Tender for Mortuary," not later than September 14, to Frederick Woodward, surveyor, town hall, Stourbridge.

September 14. FLEET.—Erection of an operating threatre at the cottage hospital, Fleet (Dr. Gilbert Wickham Memorial.) Plans and specifications may be seen at the office of John Love, M.S.A., The Terrace, Fleet, to whom tenders must be sent by 4 p.m. on September 14.

September 14. ROYTON.—Erection of buildings for the new public baths, Park Street, Royton, for the Urban District Council. Bills of quantities, drawings, and other particulars, can be obtained on application to Ernest Woodhouse, F.R.I.B.A., 88, Mosley Street, Manchester, on payment of a fee of two guineas. Tenders, in sealed envelopes, and endorsed "Tender for Public Baths," are to be delivered not later than noon, September 14, to Thos. Bleasdale, clerk to the council, town hall, Royton, near Oldham

September 14. LYDBROOK (near Ross).—Erection of a public elementary school at Lydbrook, near Ross, for the Gloucestershire Education Committee. Plans and specifications may be seen at the office of M. H. Medland, architect, 15, Clarence Street, Gloucester. Bills of quantities and form of tender may be obtained from E. A. Pryer, surveyor, 15, Clarence Street, Gloucester, upon payment of two guineas, which will be returned on receipt of a bona-fide tender. Sealed tenders, endorsed "Tender for School at Lydbrook," must be delivered not later than 9 a.m. on September 14 to H. W. Household, secretary to the Education Committee, County Education Office, Gloucester.

September 14. HERTFORD.—Erection and completion of a new county record and strong room at Hertford, for the County Council. Persons desiring to tender may see the drawings, specification, agreement, etc., at the county surveyor's office, Hatfield, between the hours of 10 a.m. and 4 p.m., except on Saturdays, when they may be seen from 10 a.m. to 12 noon. A copy of the schedule of works (quantities) and a form of tender can be obtained at the county surveyor's office upon payment of two guineas, which sum will be returned upon receipt of a bona fide tender and the documents which have been supplied. Sealed tenders, endorsed "Tender for New Record and Strong Room, Hertford," must be delivered not later than 5 p.m. on September 14, to Urban A. Smith, county surveyor, county surveyor's office, Hatfield. Such security for the due execution of the works as the county may require must be given by the contractor.

September 15. EXETER.—General reparation and joiners' work at the infirmary and offices, for the guardians of the poor. Specifications and drawings may be seen, and full particulars obtained at the office of the architect, R. M. Challice, 14, Bedford Circus, Exeter. Sealed and endorsed tenders must be sent at or before noon on September 15, to Arthur Snell, clerk to the guardians, New Buildings, Castle Street. (See also "Painting and Plumbing.")

September 15. SLIGO.—Erection of new offices and residence in Sligo for the Hibernian Bank, Limited. Plans and specification can be seen at the office of the architects. Quantities have been prepared by William Butler, building surveyor, 58, Mountjoy Square, West, and will be supplied by him on payment of £2 2s. Estimates to be sent in sealed envelope endorsed "Estimate for New Bank Premises, Sligo," to William H. Byrne and Son, architects, 20, Suffolk Street, Dublin, on or before September 15.

September 15. OXFORD.—Erection of the new church of St. Stephen, Lonsdale Road, Summertown, Oxford, for the building committee. Plans, specification of works, and conditions of contract may be seen, and form of tender, with bills of quantities obtained, at the office of A. Mardon Mowbray, architect, 117, St. Aldate's Street, Oxford, during office hours, on payment of five guineas, which will be returned on receipt of a bona fide tender. The contractor will be required to enter into a bond, with two responsible sureties, for the due performance of the contract, and no work will be ordered under the contract until such bond has been duly executed. Tenders, sealed and endorsed "Summertown New Church" to be delivered not later than noon on September 15, to Rev. C. J. Burrough, Summertown Vicarage, Oxford.

September 15. WIGGINTON-HOPWAS (near Tamworth).—Enlargement of Wigginton-Hopwas council school (near Tamworth), by 120 places, and alterations and improvements to the existing buildings, for the Staffordshire education committee. Persons desirous of tendering should atply to Graham Balfour, director of education, county education offices, Stafford. Quantities w be supplied upon receipt of a deposit of £1 1s., which should accompany the application to tender.

September 16. STOKE-UPON-TRENT.—Erection of new buildings in connection with the cottage homes of the union, at Penkhull, for the guardians. Plans, specification and bill of quantities prepared by A. R. P. Piercy, architect and surveyor. Bills of quantities, with form of tender, may be obtained at the union offices on application, and a deposit of £3 3s. Tenders endorsed "Cottage Homes" must be sent not later than 9 a.m. on September 16, to C. Daniel, clerk to the guardians, union offices, Stoke-upon-Trent. The tender will be provisionally accepted subject to the approval of the Local Government Board. Fair wages clause.

September 17. AUDLEY (North Staffs.).—Erection and completion of a new council school for about 280 children at Wood Lane, Audley, North Staffs., for the education committee. Persons desirous of tendering should apply by September 17, to Graham Balfour, director of education, county education offices, Stafford. Quantities will be supplied upon receipt of a deposit of £1 1s., which should accompany the application to tender.

September 17. BALLYMAHON (Ireland).—Erection of 75 single labourers' cottages, for the Rural District Council. The works are to be completed within six months after they have been laid out by the Council's architect under a penalty for delay. Plans and specifications and tender forms for the works can be obtained from the clerk to the Rural District Council on payment of 5s. Tenders are to be lodged at his office by 11 a.m. on September 17. The limit per cottage is £122.

September 18. PORTH (Glam.).—Erection and completion of two shops for J. Preece, Hannah Street, Porth. Plans and specification may be seen at the residence of W. D. Thomas, architect and surveyor, Tydfil House, Porth, Glam. Tenders, sealed and endorsed "Tender for Shops," to be sent not later than September 18, to J. Preece.

September 19. HAMMERWICH (near Lichfield). —Erection of new offices and cloakroom, also alterations and improvements at the Hammerwich council school (near Lichfield). Persons desirous of tendering should apply by September 19, to Graham Balfour, director of education, county education offices, Stafford. Quantities will be supplied upon receipt of a deposit of £1 1s., which should accompany the application to tender.

September 19. CANTERBURY.—Alterations and additions to the Pavilion at the St. Lawrence Cricket Ground, Canterbury, for the Kent County Cricket Club. Copies of the quantities can be obtained on depositing the sum of £5 with the architects, at whose office the plans and specification may be seen. Tenders should be sent on forms supplied, not later than 9 a.m., September 19, to Jennings and Gray, architects, 4, St. Margaret's Street, Canterbury.

September 19. SWAYTHLING.—Erection of two additional classrooms at Swaythling council school, for the Southampton county council. Persons desirous of tendering may see plans, specifications and conditions of contract, and obtain bills of quantities and other information, at the office of J. W. Taylor, county surveyor, The Castle, Winchester, between the hours of 9 a.m. and 5 p.m. (Saturdays 9 a.m. and 1 p.m.). A deposit of two guineas will be required for bills of quantities and form of tender. Deposits must be made by cheque, payable to the Hants. county council, and crossed "Bank of England." Tenders to be endorsed "Additions Swaythling Council School," and delivered not later than 10 a.m. on September 19, to H. Barber, clerk to the county council, The Castle, Winchester.

September 21. SUTTON COLDFIELD.—Erection of a school to accommodate 200 children in the Green Lanes, Chester Road, for the Corporation. Specification and quantities may be obtained from Crouch, Butler, and Savage, architects, 39, Newhall Street, Birmingham, on deposit of two guineas. Tenders, marked "Green Lanes School," to be delivered on or before September 21, to R. A. Reay Nadin, town clerk, council house, Sutton Coldfield.

September 21. SOUTHWICK.—Erection of a new police station at Southwick, in the county of West Sussex, for the county council. Specification, and plans, together with conditions of contract, may be seen at the office of the county surveyor, between the hours of 10 a.m. and 5 p.m. Quantities will be supplied on application and deposit of £1. Tenders,

endorsed "Tenders for Police Station at Southwick," to be addressed and sent to reach the county surveyor, 22, Worthing Road, Horsham, on or before September 21.

September 21. WEST EALING.—Erection of new school, Cranmer Avenue, West Ealing, for the education committee. Drawings and specification may be seen, and forms of tender, together with bill of quantities and other particulars, obtained from Charles Jones, M.Inst.C.E., borough engineer, town hall, Ealing, W., any day during office hours upon payment of a deposit of £5 5s. Sealed tenders, in the envelopes provided, endorsed "Tenders for Lammas School," must be delivered not later than noon on September 21, to J. B. Johnson, secretary, education office, town hall, Ealing.

September 21. CORFE MULLEN (near Wimborne).—Erection of a pumping station, buildings, tanks, cottages and other work connected therewith, at Corfe Mullen, near Wimborne, in the county of Dorset, for the corporation of Poole. Drawings may be inspected and copies of the conditions, specifications, bills of quantities and forms of tender obtained upon application to the engineer, William Matthews, 39, Victoria Street, Westminster, and after the payment to the town clerk, of £2 2s. Tenders will be received up to 9 a.m., September 21, by Charles Lisby, town clerk, municipal offices, Poole.

September 22. SOUTH SHIELDS.—Alterations at Laygate divisional police station, for the Corporation. Drawings may be seen and bills of quantities obtained from S. E. Burgess, M.I.C.E., borough engineer and surveyor, Chapter Road. Sealed tenders must be delivered at the office of the town clerk, Court Buildings, South Shields, not later than 4 p.m., on September 22, endorsed "Tender for Alterations, Laygate Police Station."

September 22. MORTLAKE.—Erection of a new ward block, etc., at the isolation hospital, South Worple Way, Mortlake, S.W., for the Barnes U.D.C. Drawings and specification can be seen and bills of quantities and forms of tender obtained on application to G. Bruce Tomes, Assoc.M.Inst.C.E., surveyor to the council, council house, High Street, Mortlake, S.W., to whom tenders, sealed and endorsed "Tender for Proposed New Block, etc.," must be sent not later than noon on September 22. The sum of one guinea will be required as a deposit.

September 23. NEWBRIDGE (Mon.).—Erection of thirteen villas at Newbridge, Mon., for the North Road building club, Newbridge. Plans and specifications may be seen at the office of A. J. Bowen, architect, Crown Street, Crumlin. Sealed tenders, endorsed "Tender for Villas," to be sent to T. A. Thomas, Bryn-Awel, Abercarn, Mon., not later than September 23.

September 24. ASHFORD.—Construction of a brick-foundation, timber and iron-covered cowshed for 20 cows, at Henwood Farm, Hythe Road, Ashford, Kent, for the Urban District Council. Plan and specification may be seen, form of tender, and any other information obtained, on application to William Terrill, surveyor, 5, North Street, Ashford, Kent. Sealed tenders, endorsed "Cowshed," to be sent to John Creery, solicitor, 11, Bank Street, Ashford, not later than 5 p.m. on September 24.

September 26. NETHERNE.—Erection of an isolation hospital and cottages, for the staff, for the Surrey County Council. Application for bills of quantities, accompanied by a deposit of £2, to be made to the architect, George T. Hine, F.R.I.B.A., 35, Parliament Street, Westminster, S.W., on or before September 12. Tenders, endorsed "Tender for Buildings," to be delivered not later than noon on September 26, to M. E. Reed, clerk to the committee, County Hall, Kingston-on-Thames.

September 28. NEWCASTLE-UPON-TYNE.—Construction and erection of a two-storey shed about 303 feet long and 66 feet wide, together with an approach bridge, in connection with the quay improvement, for the Corporation. The contract includes the steelwork, brickwork, reinforced concrete floor, rock asphalt pavings, roof coverings, sliding doors, glazing, etc. On and after September 10, and payment of £2 2s. to the city treasurer, town hall, Newcastle-upon-Tyne, a copy of the general conditions, specification, bill of quantities, and form of tender can be obtained, and the drawings inspected, at the city engineer's office, two hall. Prints of any of the ten plans may be obtained on payment of 2s. 6d. each to the city treasurer, which sum will not be returned. Tenders, addressed to the city engineer, town hall, Newcastle-upon-Tyne, and endorsed "Two-Storey Shed," to be received not later than 10 a.m. on September 28.

September 28. NEWBRIDGE (Co. Kildare).—Erection of 12 "B" married soldiers' quarters in Newbridge Barracks, co. Kildare, Ireland, for the war department. Plans and specification may be inspected at the office of the director of barrack construction, Newbridge, on September 14, 15, and 16. Bills of quantities and form of tender will be forwarded on application, addressed to the director of barrack construction, Pall Mall, London, S.W. The application must be accompanied by ten shillings, which is not returnable, and must be received not later than September 19. Tenders, in sealed envelopes, marked "Tenders," are to be delivered not later than noon on September 28, to H. De la Bere, director of army contracts, war office, Whitehall, London, S.W. Bills of quantities are to accompany the tender in separate sealed envelopes, similarly addressed and marked "Bills of Quantities for Work Proposed at Newbridge Barracks, Ireland," and also with the contractor's name and address.

October 2. WALLINGFORD (Berks.).—Erection of a new school for 250 scholars at Wallingford, Berks., for the education committee. Persons desirous of tendering are required to send their name to the secretary on or before September 14, together with a deposit of £3 3s., for bills of quantities, which will be supplied by post. Plans, specification, and form of contract will be open for inspection at the education secretary's office on and after September 14, between the hours of 10 and 5. Tenders must be delivered on the form and in the envelope provided, not later than first post on October 2, to the secretary to the education committee, The Forbury, Reading.

October 2. WALTHAM ST. LAWRENCE (Berks.).—Erection of a new school, for 200 scholars, at Waltham St. Lawrence, Berks, for the education committee. Persons desirous of tendering are required to send their names to the secretary, on or before September 14, together with a deposit of £3 3s., for bills of quantities, which will be supplied by post. Plans, specification, and form of contract will be open for inspection at the education secretary's office on and after September 14, between the hours of 10 and 5. Tenders must be delivered on the form and in the envelope provided, not later than first post on October 2, to the secretary to the education committee, The Forbury, Reading.

No date. USWORTH.—Erection of a brick chimney 130 ft. high. Plans and specifications may be seen on application to the engineer, Usworth Colliery office.

No date. TREDEGAR.—Erection of 40 houses to be built on Mile Field, Tredegar, for the Tredegar workmen's building society. Plans and specifications may be seen at the office of the architect, A. F. Webb, High Street, Blackwood.

No date. SHEEPRIDGE (near Huddersfield). — Erection of new Wesleyan Sunday school, and alterations to the present chapel, Sheepridge, near Huddersfield. Persons desirous of tendering are requested to forward their names to Garside and Pennington, architects, Pontefract, and Castleford, when bills of quantities and other particulars will be forwarded.

ENGINEERING.

September 10. EASTNEY (Portsmouth). — Repairing main pumps and engines at the Eastney pumping station, for the Corporation. Specification may be seen and form of tender obtained at the borough engineer's office at the town hall. The form of tender is to be completely filled in and sent under cover not later than 10 a.m. on September 10, to Alexander Hellard, town clerk, town hall, Portsmouth. Fair wages clause.

September 10. ROTHERHAM.—Heating the Alma Road council schools, for the Corporation. Plans of the schools and further particulars may be obtained at the office of the architect, J. Platts, Rotherham, until September 10. Tenders, sealed and endorsed "Tender for Heating Alma Road Council Schools," to be sent not later than September 10, to Spurley Hey, director of Education, education offices, town hall, Rotherham. Fair wages clause.

September 10. MILFORD HAVEN.—Supply and erection at the gasworks of the following appliances, etc., for the Urban District Council. 1. Exhauster and engine capable of passing 6,000 cubic ft. of gas per hour. 2. Rotary washer-scrubber capable of dealing with 100,000 cubic ft. per 24 hours. 3. Purifier, 8 ft. square, and 5 ft. deep. 4. 3,468 yds. of cast-iron S. and F. gas mains in the following sizes—i.e., 6 in., 4 in., 3 in., by 9 ft. Full particulars may be obtained from R. J. Calderwood, gas and water manager to the council. Sealed tenders, endorsed "Contract No. —" (as the case may be), addressed to the chairman of the gas and water committee, must be received not later than 1 p.m. on September 10, by Thomas H. Lewis, clerk, Milford Haven.

September 12. BOLTSBURN.— Sinking two shafts at Boltsburn lead mine, for the Weardale Lead Co. The company supply machinery and enginemen to pump the water and draw the work. Specifications and conditions on application. Tenders will be received up to September 12.

September 12. MARAZION (Cornwall).—Erection of water storage, etc., at Marazion Council school, for the Cornwall Education Committee. Plans and specification may be seen by appointment at the school, or the office of Sampson Hill, architect to the committee, Green Lane, Redruth, from whom all particulars relating to the work may be obtained. Sealed endorsed tenders are to be sent on or before September 12, to F. R. Pascoe, secretary, education office, Truro.

September 12. DOWNPATRICK.—Improvements and alterations to the Downpatrick waterworks, for the Rural District Council. Specification may be seen at the office of the clerk to the council, on any weekday, except Saturday, from 10 a.m. to 4 p.m. Sealed tenders, containing names of two solvent sureties, willing to join in a bond for the due performance of the contract, will be received up to 8 a.m. on September 12, by R. L. Morrow, clerk of council, clerk's office, Down Union.

September 12. BALLINASLOE.—Supply and erection of a steam laundry plant, for the joint committee of Ballinasloe Asylum. Plans and specifications prepared by the engineer, Geoffrey B. Meenan, 5, Charleville Road, Rathmines, Dublin, from whom copies may be obtained on payment of £1 1s., returnable on receipt of a bona fide tender. Contractors will be required to enter into a bond for the due performance of the work. Tenders to be endorsed "Tender for Laundry Plant," and delivered not later than September 12, to J. St. L. Kirwan, resident medical superintendent, board-room, Ballinasloe Asylum.

September 14. STONEHAVEN.—Executing the following works, for the Stonehaven Harbour Trustees. 1. Excavation of rock (about 1,600 cubic yds.) in new harbour basin. 2. Erection of a stair in new basin. Specifications and schedules of rates may be obtained from the clerk, or James Barron, M.Inst.C.E., 216, Union Street, Aberdeen, on payment of 5s. Tenders to be lodged on or before September 14, with Jas. B. Cunningham, clerk, Stonehaven.

September 16. MANCHESTER.—Providing and fixing a low-pressure heating apparatus at the Grange Street Municipal School, Grange Street, Manchester, for the education committee. Plans may be seen and a copy of bills of quantities (including specification) obtained at the education offices, Deansgate, Manchester, on a deposit of one guinea. Tenders, enclosed in the envelopes provided, must be delivered not later than 9 a.m. on September 16, to William Henry Talbot, town clerk. Cheques to be made payable to the accountant, education offices, Deansgate, Manchester.

September 28. NEWCASTLE-UPON-TYNE. — Construction and erection of about 180 tons of steelwork for the bridge over the Ouseburn, in connection with the quay extension, for the Corporation. On and after September 10, and on payment of £2 2s. to the city treasurer, town hall, Newcastle-upon-Tyne, general conditions, specification, bill of quantities, and form of tender can be obtained, and drawings inspected at the city engineer's office, town hall. Blue prints of any of the eight plans can be obtained on payment of 2s. 6d. each to the city treasurer, which sum will not be returned. Tenders, addressed to the city engineer, town hall, Newcastle-upon-Tyne, and endorsed "Bridge over Ouseburn," to be received not later than 10 a.m. on September 28.

October 1. HOLSWORTHY.—Construction of an impounding reservoir, service reservoir, and filter beds, and the laying of cast-iron mains, and other work at Holsworthy, for the Urban District Council. Plans may be seen at the office of the engineer, I. Chadwick, Bletchley, Bucks, or at the office of the solicitor. Copies of specification, quantities, and form of tender may be obtained from the engineer on payment of £3 3s., which will be returned upon receipt of a bona fide tender. Sealed tenders, endorsed "Holsworthy Waterworks," to be delivered on or before October 1, to W. C. R. Peterson, solicitor, clerk, Holsworthy, Devon.

IRON AND STEEL.

September 14. HINDLEY.—Supplying 1,000 yds. 6 in. open socket and spigot c.i. pipes, also 1,000 yds. open socket and spigot steel pipes, for the Urban District Council. Specification and forms of tender may be obtained from H. O. Timmins, gas engineer. Sealed tenders, endorsed "Gas Main," to be delivered on or before September 14, to Thomas Robey, clerk to the council, council offices, Hindley.

Specifications and forms of tender may be obtained from the surveyor to the council, H. Frost, town hall, Gosport. Tenders, sealed and endorsed "Tender for ————," as the case may be, should be delivered with any necessary samples at the offices of the council, not later than noon on September 10. Fair wages clause.

September 11. LEEDS.—Supplying, lettering, and fixing gravestones, at the Leeds, Holbeck, Hunslet and Harehills Cemeteries, for the Corporation. Forms of tender and all particulars may be obtained, and copies of the documents may be inspected, on payment of a deposit of one guinea, at the office of W. T. Lancashire, city engineer. Tenders, properly endorsed, should be received at the town clerk's office not later than 10 a.m. on September 11.

September 11. DUBLIN.—Building, plumbing, heating, and electric lighting works at the State Apartments, Dublin Castle, for the board of public works. Plans and specifications can be seen at the office of the secretary, and of the overseer of works, Dublin Castle. Forms of tender will be supplied on application to H. Williams, secretary, office of public works, Dublin. Envelopes containing the tenders and the detailed estimates must be endorsed "Tender for Building, Plumbing, Heating, or Electric Lighting Works, Dublin Castle," as the case may be. Tenders will be received not later than 10 a.m. on September 11.

September 15. TAUNTON.—Supplying, 1, Portland cement and lime; 2, stoneware pipes, etc.; 3, manhole covers and frames; 4, bricks; 5, petroleum and oils; 6, disinfectant; 7, blue lias paving curb and channel; 8, general stores and ironmongery, etc., etc., for the term of one year, commencing on October 1, 1908, for the council. Particulars and forms of tender, together with any other information, may be obtained upon application to David Edwards, A.M.Inst.C.E., borough engineer and surveyor, municipal buildings, Taunton. Sealed tenders, endorsed "Tender for Requirements," to be addressed to the town clerk, Municipal Buildings, not later than September 15.

Appointments Wanted.

The charge for Advertisements under this heading is 1s. 6d. per insertion for the first four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two. Advertisements can be received up to 10 o'clock on Tuesday morning.

Advertisements received on Tuesday morning will be found on page xxvi.

REFINED Detail, architect's assistant, fully qualified, 10 years' experience, best work—school, municipal, domestic work. Give part time evenings to competition work; specimens; highest references.—Apply Classic, Box 4533, BUILDERS' JOURNAL Office.

ARCHITECT'S assistant (7 years), thoroughly qualified in ferro-concrete work, London and Paris experience, requires permanency at home or abroad.—Apply Box No. 4562, BUILDERS' JOURNAL Office.

ADVERTISER requires situation in south of England; experienced in all branches of land and building surveying, levelling, quantities, dilapidations, 5 years with Urban Council, near London; good draughtsman; qualified P.A.S.I.—Box 4538, BUILDERS' JOURNAL Office.

ARCHITECTURAL draughtsman and general assistant requires engagement; age 30; 14 years' experience in ecclesiastical and domestic work; salary according to position offered.—Fimo, 171, Seaview Road, Liscard, Cheshire. 4530

ARCHITECT (practising) is willing to assist others in all kinds of architectural and office work, at own office, or elsewhere.—S., 143, Cannon Street, E.C. 4528

ARCHITECT (age 29), desires post as traveller calling on architects, builders, etc. (north preferred).—Address Box 4497, BUILDERS' JOURNAL Office.

ARCHITECT and surveyor's assistant desires engagement, 15 years' experience; good draughtsman, colourist, etc., working drawings, details, specifications, surveying, levelling, and general routine; moderate salary; excellent references.—A. R., 1, Ivy Villas, Cheam, Surrey. 4557

ARCHITECT and Surveyor's Assistant (24); 9 years' London exp.; working drawings, specifications, superintendence, quantities and land surveying: prizeman, architectural drawing, and quantities; medallist building construction; excellent testimonials; mod. sal.—W., 20, Holmewood Road, Streatham Hill, S.W. 4498

ARCHITECT'S Assistant requires situation immediately; 7 years' varied experience; capable draughtsman, tracer, colourist, perspectives, details, specifications; assist quantities, supervision. Take charge; good education; 25th year; 35s. weekly.—Box 4522, BUILDERS' JOURNAL Office.

A Practical estimator will be pleased to price builder's quantities or give estimates from plans and specifications for tendering, quickly by post. Send for lowest terms.—Estimator, c/o Mr. Moth, Baddow Road, Chelmsford. 4535

ASSISTANT A.R.I.B.A. (29), thirteen years' London Provincial experience; testimonials, references, working drawings, details, specifications, supervision perspectives, office work; well up in management; salary 2 guineas.—Apply A., 31, Cotswold Road, Westcliff-on-Sea, Essex. 4512

ARCHITECT and surveyor's managing assistant, A.R.I.B.A., desires engagement at home or abroad. Twenty years' experience. Good testimonials and references.—C. A. C. Springfield, 31a, Leyland Road, Lee, S.E. 4542

ARCHITECT'S Assistant, well recommended, 14 years' good all-round experience; practical, working and detail drawings, quantities, specifications, supervision; salary 2½ guineas. — Box 4536, BUILDERS' JOURNAL Office.

ARCHITECT and surveyor's junr. assistant; 5½ years' experience; working and detail drawings; levelling, perspectives, specifications; assist quantities; excellent testimonials; moderate salary.—Box 4546, BUILDERS' JOURNAL Office.

ARCHITECT'S assistant, experienced in working drawings, details, surveys, etc.; first-class references; specimens of work; orders taken for water colours, perspectives, deed plans for conveyancing, drawings, designs, etc.—Aubrey Pritchard, Bryndenden, Rhyl, N.W. 4549

ARCHITECT and surveyor's assistant, 10 years' good all-round experience, north and south; take charge; capable draughtsman; working drawings, details, quantities; moderate salary.—W. T., 49, Whitstable Road, Canterbury. 4561

ARCHITECT'S Assistant, 7 years' experience, desires engagement in London or provinces; designs, working drawings, details, etc.; excellent references; moderate salary. — Apply Box 4548, BUILDERS' JOURNAL Office.

BUILDER'S clerk, used to double entry, dissecting time sheets, etc.; good general experience; draughtsman; within 60 miles radius.—Henry, 4, Plimsoll Road, Finsbury Park, N. 4493

BUILDER, with nine years' experience in first-class house-building and general repairs, desires appointment; fair draughtsman, well up all trades, tradesman; moderate salary; highest references.—Box 4507, BUILDERS' JOURNAL Office.

BUILDER'S Assistant (23), disengaged; construction, surveying, mensuration; fair knowledge quantities and levelling; also costs, accounts, wages, etc.; good draughtsman; supervise jobs and assist estimating.—Box 4523, BUILDERS' JOURNAL Office.

BUILDER'S Clerk and assistant (20), seeks engagement, general experience, book-keeping, time sheets, plans, etc.; good references, and moderate wages.—Apply Box 4555, BUILDERS' JOURNAL Office.

CARPENTER and joiner, 32, wide experience, all branches of building, take charge; good references; very energetic; good manager and timekeeper.—Pearson, 53, Hartham Road, Isleworth, W. 4552

CARPENTER and joiner, work wanted, piecework; any quantity; labour only; good references.—W., 14, Gorrings Park Avenue, Mitcham, Surrey. 4526

CARPENTER and joiner wants work; bench fixing, alteration, or jobbing. Could take charge of general work. Life abstainer. Good references. Age 32. Very energetic.—Pearson, 53, Hartham Road, Isleworth, W. 4471

CLERK of Works; age 30; practical and reliable; exceptional experience with buildings, plans, etc.; architectural training; would serve part time in office; cyclist.—Box 4464, BUILDERS' JOURNAL Office.

CONTRACTS.—Estimator, measurer, etc. (London and country experience), requires position. Successful in tendering. Can guarantee brisk business. Make most of measured accounts, and practically and efficiently help with management. Country preferred. Small salary. — Estimator, Durston House, The Grove, Deal. 4564

ENGINEER wants post, London or provinces; 12 years' experience; or undertakes preparations, calculations, quantities, designs, detail drawings, structural steelwork, and reinforced concrete.—Box 4451, BUILDERS' JOURNAL Office.

ESTIMATOR and building surveyor, Q.S.A., desires re-engagement with builder, architect, or surveyor; permanent or temporary; estimates, quantities, measurements, variations and accounts.—A 768, Fulham Road, London, S.W. 4501

FOREMAN, decorator good colourman, grainer and paperhanger; able to estimate; thoroughly experienced in management of men, for general jobbing work; age 42; wages £2 per week.—Box 4524, BUILDERS' JOURNAL Office.

FOREMAN seeks engagement; shop or building; carpenter, joiner, practical, machinery, quick setter out; last refs. 7 years; age 38.—C. M., Cedars, Spring Road, Kempston, Bedford. 4483

GOOD shopfitter and case-maker requires constant job; abstainer; refs. if required. Indoor hand. — Box 4388, BUILDERS' JOURNAL Office.

IMPROVER, brass-finisher, requires situation; 3 years' previous experience with well-known London firm; excellent references. Apply Box 4550 BUILDERS' JOURNAL Office.

IMPROVER or junior assistant (23), varied experience, neat draughtsman, surveying, assist with quantities; excellent references; small salary return for first-class experience. — Apply Box 4559, BUILDERS' JOURNAL Office.

MACHINIST (joiner) requires re-engagement; good spindle hand, used to first-class work; 10 years last place; good references.—H. Cruse, Boxford, Newbury, Berks. 4537

MACHINIST seeks permanency; work spindle, planer, tenoner, morticer, dovetailer, sharpen saws, make cutters, take charge of small plant; country job preferred. — Machinist, 39, Cathnor Road, Shepherd's Bush, W. 4504

PAPERHANGER, practical, wants piecework; builders' flats, hotels, and clubs.—S. Jamer, 48, Carlisle Street, N.W. 4539

PLUMBER, experienced (registered), gas and hot water fitter, new jobbing, sanitary work, good lead layer, desires permanency; excellent references; town or country. — Box 4556, BUILDERS' JOURNAL Office.

PLUMBER (Registered) wants re-engagement as leading hand or otherwise. Thoroughly practical in all latest sanitary improvements. Town or country.—R. P., 18, Chertsey Street, Tooting, S.W. 4482

QUANTITY surveyor and draughtsman requires engagement; 15 years' experience; taking-off, etc., working drawings, specifications, supervision, passed final examination, Quantity Surveyors' Association; provinces preferred; low salary.—Box 4544, BUILDERS' JOURNAL Office.

WRITER, grainer, paperhanger, and painter. Builders' painting taken (piecework if desired). Any distance. Reliable and energetic. Estimates. Life experience. Moderate.—H. Rivers, Evesham Road, Reigate. 4563

£5 is deposited with cashier of a bank, and will be paid to anyone securing permanent position for draughtsman-surveyor desiring change; thorough constructional training, quantity surveyor; fullest investigation; references; articles; age 23; salary, desired.—Box 4541, BUILDERS' JOURNAL Office.

Appointments Vacant.

ARCHITECT'S pupil, vacancy in busy West-end architect's office; small premium required but must be fond of drawing.—Stanley-Barrett and Driver, 23, York Place, Baker Street, W. 4521

WANTED, for a permanency in the office of an old-established firm of surveyors in the city, a youth of good appearance and education, with previous office experience, who can write a good hand, quick and accurate.—Apply, in own handwriting, with copies of testimonials, stating salary asked, to Box 4457, BUILDERS' JOURNAL Office.

Patent Licences.

TO BRASS FOUNDERS AND COCK MANUFACTURERS.

The Proprietor of Letters Patent No. 13043 of 1903 for "Improvements in Valves and Taps," is desirous of entering into negotiations with firms in Great Britain for the granting of licenses on reasonable terms. Particulars will be furnished on application by Mewburn Ellis and Pryor, 70 and 72, Chancery Lane, W.C. 4527

PATENT.—The proprietor of patent No. 3338, dated 10th February, 1904, relating to improved ceiling and flooring, desires to enter into arrangements, by way of license or otherwise, on reasonable terms, for the purpose of developing and practically working the same in this country. Enquiries should be addressed to W. P. Thompson and Co., Chartered Patent Agents, 322, High Holborn, London, W.C. 4558

Business Wanted.

WANTED, a jobbing builder's business in London suburbs preferred. Apply, stating all particulars, to Box 4415, BUILDERS' JOURNAL Office.

Businesses for Sale.

NEWPORT, SHROPSHIRE.

To be sold, the old-established builders' and contractor's business for many years carried on by Mr. George Ingram Muirhead, and for some time past known as "George Ingram Muirhead, Ltd.," situate adjoining and fronting the main road near the station (L. and N.W. Railway), Newport, Salop

The yard is well equipped with all modern machinery and plant, and immediate possession can be given; all contracts just completed, stock-in-trade, machinery, etc., at a valuation; inspection by appointment.—Apply to Messrs. Pooler and Davies, Auctioneers and Valuers, Newport, Shropshire. 4540

JOBBING builder and decorators' business in Suffolk; old-established; freehold house and premises for sale.—Box No. 4475. BUILDERS' JOURNAL Office.

Partnerships & Practices.

AN Architect and Surveyor practising in Essex is anxious to collaborate or enter into partnership with another architect practising within easy distance of Chelmsford. — Apply "Essex," Box 4508, BUILDERS' JOURNAL Office.

YOUNG architect, with small capital, seeks position in good office, with view to partnership. Capable all-round man. Excellent references.—Box 4547, BUILDERS' JOURNAL Office.

Dissolution of Partnership.

MR. A. E. TUTTE, architect and surveyor, having dissolved partnership with Mr. Cook (Cook and Tutte) and closed the offices at 394, Commercial Road, Portsmouth, has opened offices at 91, London Road, Portsmouth. 4496

September 16, 1908. Volume 28, No. 710

Our New Departure.

This week we publish official reports of the transactions of various associations connected with the National Federation of Building Trades Employers of Great Britain and Ireland. In arranging with the Federation to present a monthly record of the movements in which this growingly-powerful and influential organisation is chiefly concerned, we believe that we are increasing considerably the use and interest of this journal, by placing our readers and ourselves in the forefront of an important movement. In order to realise its title at all adequately—and, in fact, in order to justify its existence—the "Builders' Journal" must strive to represent as completely as possible all the interests involved in the great industry of building. There are two ways in which this may be done. It may be done casually and heterogeneously, or methodically. The latter way seems to us to be the more correct and by far the more effectual. For some time past, we have issued, in regular succession, a section on fire prevention, another on concrete and steel construction, and a third dealing specially with the interests of contractors. To the last-named of these three eminently successful sections, we are now making, by the publication of these official reports, what we conceive to be a valuable addition; for we feel that we are entitled to claim that now, for the first time, by the inclusion of this feature, the interests of builders of all denominations are represented with a fulness never previously attempted by any trade journal. We believe that by concentrating attention first on one section and then on another, as we are doing, we secure an intensiveness and a thoroughness of treatment that would not be possible if the same information were presented in the ordinary scrappy and scattered way. But we wish it to be quite clearly understood that in making this further important addition to the business side of building, we have not the smallest intention of abating one jot or tittle of our interest in architecture pure and simple. The reason why we have no special section for that supremely important subject should be perfectly obvious. Architecture pervades the paper in every issue, in every section, and in almost every item; the architect is after all the real master builder, without whose art and skill and influence building would become a thing of naught. Him, therefore, we shall continue to serve as fully and as faithfully as heretofore, and we believe that our new departure will be recognised and appreciated by the architect as a substantial acknowledgment of the comprehensiveness of his outlook. At all events, it is offered as an addition to, and by no means in substitution for, the features that have secured for this journal the high estimation in which it is held by the profession.

Blaspheming Buildings.

The rather desultory newspaper correspondence on the "disfigurement of the country," by the existence of unlovely buildings, has drawn from Mr. Thackeray Turner the suggestion—not his own, as he acknowledges—that the ugliness of many modern buildings would have been avoided if only suitable building materials had been used, and that it is the materials and not the designs, which we should aim at influencing. He contends that some modern buildings "swear at you as you pass." Of course Mr. Thackeray Turner is too polite to return the compliment, with interest. A remedy suggested by another correspondent is that local societies should be formed, who would study the subject and make a list of suitable and unsuitable materials for their district, and circulate the list, in the form of leaflets, to architects and builders. This suggestion strikes us as being almost pathetic in its Arcadian simplicity. It discounts the stubborn practical-mindedness of most architects and builders. It strikes us, therefore, that these local societies must remain comparatively ineffectual until they had succeeded in abolishing the railways and other means of transit by which the obnoxious materials are brought in from outlandish parts. This reform would greatly curtail the opportunities of the "numberless people who," Mr. Turner informs us, "spend their leisure time in travelling about the country and enjoying its beauty, but also grieving over its disfigurement." It would be cruel to rob them of a grievance that we are convinced is as dear to them as are the beauties of the country; and it is extremely doubtful, after all, whether, in the net result, there would be any really substantial reduction in the total volume of blasphemy addressed either from or towards buildings of dubious congruity.

Anarchy in Architecture.

The lay press does not, as a rule, contribute to the discussion of architecture much that is really luminous. It is, therefore, the more gratifying to find in last Wednesday's "Times" a leading article that certainly stands outside the stupendous category of ignorant essays in criticism. It deals trenchantly with what, in its title, is called "The New Architecture of London," and one can forgive the rather dogmatic and ex-cathedra tone of a writer whose obvious mastery of principles entitles him to form and to express rather positive opinions: to which, of course, he will not expect everybody to yield unequivocal assent. Few will find fault with his main propositions—that thirty years ago there was hardly a sign of the new movement; that the ambition to be "scholarly" made for imitation rather than for originality; that the new desire for beauty is producing a profusion of ornament and rash experiments in style; and that, as old principles no longer apply and new ones have not yet been established, our architecture is at present in a state of anarchy. But this rather dogmatic dictum is not likely to pass unchallenged: "The tone of architecture is to express the uses of a building in terms of beauty; and an original architecture is likely to arise only when the architect cannot get away from this problem, when use dictates his design and his employers will not be content with it unless he makes it beautiful." Probably the writer is substantially correct in his statement of the problem; and his insinuation that the architect is apt to evade it unless his client insists on a true solution strikes one as being rather too severe on the architect, and somewhat too flattering to the client. It seems to reverse their positions. The client who has sufficient enlightenment to insist on having his building beautiful must always depend on the taste and ability of the architect for the achievement of that most desirable result. A public whose æsthetic taste is in advance of that of its specially-trained intelligences is simply impossible. But if the writer merely means—as we assume that he does mean—that the architect is strongly influenced, for good or ill, by the general standard of culture and refinement, then, of course, his statement is a mere truism, somewhat obscurely expressed. But the article, as a whole, is excellent and suggestive reading, and the architect will, in particular, rejoice in its general tendency towards cheery hopefulness—a seductive

quality that, though we have barely succeeded in indicating it in this brief summary, certainly pervades the article.

Cheap Cottages and Cheaper Criticism.

One of the most valuable results of a cottage exhibition is the criticism it challenges. In this respect, at all events, the exhibition at Walker Gate, Newcastle, has been uncommonly successful; the hardy northerners being strong and tenacious of their opinions, and being by no means backward in expressing them with characteristic vigour and bluntness, Mr. Henry R. Aldridge, organising secretary of the exhibition, has been constrained to reply to what he calls the "acute controversy" that has followed in letters appearing in the Newcastle press, and on speeches delivered at the recent meeting of the Newcastle and Gateshead Trades Council. He brushes aside as frivolous a charge of "jerry building" that appears to have been based on the smallness of some of the rooms, and on the adoption of cavity walls, and he points out, rather instructively, that Newcastle and Carlisle stand almost if not entirely alone amongst English cities in the retention of the old by-law stipulating that 14in. solid walls shall be built. His impatience at the free-and-easy use of the expression "jerry-building" is not only amply justified in the present case, but may safely be extended to the majority of instances in which it is used. It has been used so wantonly and ignorantly as a cheap sneer that it has lost all significance, except as an indication of malice and incompetence on the part of the user. The smallness of the rooms of the Walker Gate cottages is the only complaint about them that, says Mr. Aldridge, is "fairly general." It may, therefore, be inferred to be generally fair. There is, as he acknowledges, a strong preference for large rooms. It is a wholesome asperation; but the difficulty is to give effect to it in cottages that are destined to be let at from 6s. 6d. to 8s. 9d. a week. Mr. Aldridge is, therefore, fain to confess that, in spite of the Walker Gate exhibition, "the problem of housing the poorest workman still remains unsolved." It is easier to diagnose the disease than to supply the remedy.

BRUGES FROM THE QUAI VERT.

FROM A WATER COLOUR SKETCH BY EDWARD HASTIE.

This is one of the most picturesque of the views for which the old Flemish City is famous. The old stone bridge—one of the many which give the name to the town—is quiet and silent now, but over its cobbled road have passed many generations of Burghers in the bustling times when Bruges was one of the marts of the world. In the distance—the old Belfry "thrice rebuilded" still "watches o'er the town."

Garden Cities Galore.

Garden Cities for the middle classes, on the Nuns' Moor and on the Fenham Estate, near Newcastle, are being built, a northern newspaper correspondent points out, "not by a wise manufacturer for his workpeople, nor by a reform association for experiment, but by ordinary builders to make money." Such enlightened enterprise near Newcastle seems extraordinary to this correspondent; but surely it is common enough elsewhere. In the south, at all events, garden cities (a curiously inept expression, by the way) created by private enterprise have come into existence in every suburb, without exciting our special wonder; but we are not quite sure whether they have yet been discovered by the enterprising newspaper correspondents who would probably be amazed to find that the much-abused speculative builder has created many a leafy and lawny residential estate that would put Letchworth to the blush.

Labelling Buildings.

It has been once more suggested—this time by that devoted lover of London, Mr. J. Ashby Sterry—that our interesting buildings ought to be labelled. Mr. Sterry, like the rest of us, has been of late frequently asked by visitors (of whom hundreds of thousands have been attracted to London by the Franco-Exhibition) to disclose the identity of the buildings that naturally excite the curiosity of the sightseers from abroad, or from the provinces, who, indeed, can hardly be more ignorant in such matters than the average Londoner. It is not every building that bears its character in its face, so to speak, as unmistakably as did the Old Bailey. This grim old structure, with its frowning walls and its ostentatious display of heavy iron fetters over one of the doorways, revealed its character clearly enough, but still left the stranger in some doubt as to its name. Hence we overheard an American lady remark as she gazed at it, "Waal, I guess this is the town jail; but why don't they put its name up?" Mr. Sterry thinks that every public building should be inscribed with its function, the date of its erection, and the name of its architect. There can be no doubt as to the convenience of such a provision; but we must own to serious misgivings as to the concrete interpretation of the idea. A regulation uniform label and a prescribed position for it would not be equally suitable for all buildings. Some it might adorn, others it would disfigure. And if the form and position were left to individual discretion, we should certainly get some startling effects. Superscriptions as are already in existence on London buildings make us yearn rather for the extinction than for the extension of a practice that lends itself easily to barbarous effects.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

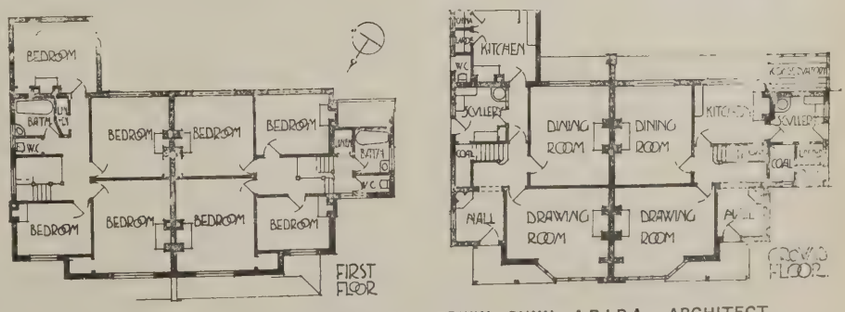
DATE OF DELIVERY.	COMPETITION.
Oct. 7	BOAT SHELTER, INVERNESS. Engineers invited to submit plans for a scheme, not exceeding, in cost, the sum of £10,000. Conditions from Kenneth Macdonald, Clerk to the Harbour Trustees, Town House, Inverness.
31	BURY. NEW SECONDARY SCHOOL for the Education Committee. Premiums of £50, £25, and £10. Particulars and site plan from Robert Wilkinson, Director of Education, 8, Bank Street, Bury. Deposit £1 1s.
Oct. 31	*COUNTY HIGH SCHOOL FOR GIRLS, ROMFORD.—Applications for Conditions to D. T. Williams, 71, South Street, Romford, Essex, to be made by or before August 24th, accompanied by deposit of five guineas, of which sum five pounds will be returned on receipt of bona fide design.
Nov. 1	COUNTY HALL AND OFFICES, CARDIFF. Particulars and site plan from T. Mansel Franklen, Clerk, Glamorgan County Council Offices, Cardiff.

** This competition has been unfavourably reported upon by a Correspondent.*

Bury New Secondary School—We are informed by Mr. Robert Wilkinson, the Director of Education:—"That the number of application for copies of conditions and instruction, etc., has been so great that we have been compelled to require a deposit for one guinea for plans of the site, which sum will be returned on the submission of a bona-fide set of plans." Will intending applicants kindly note?

The new Grammar School for Malton.—Mr. Paul Waterhouse, M.A., F.R.I.B.A., of London, the assessor appointed by the North Riding County Council to select plans for the erection of a new grammar school for Malton and district, has given his decision. Four architects entered the competition, and Mr. Waterhouse recommended plans prepared by Mr. W. H. Brierley, of York, for approval. Messrs. Bottomley, Son and Welburn, of Middlesbrough, were second, and will receive £10. Messrs. Clarke Moscrop, and Feetham, of Darlington, were third, and Mr. C. H. Channon, of Malton, was fourth.

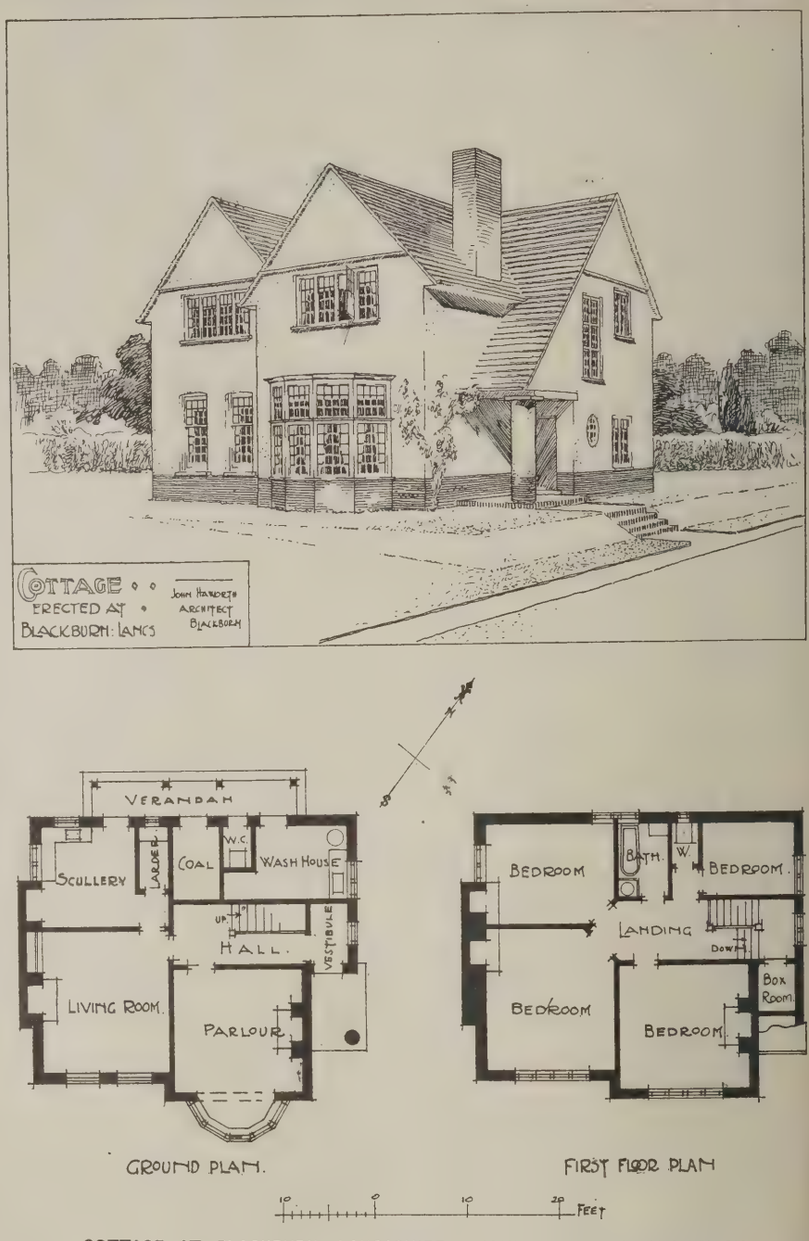
HOUSES AT NORTH FINCHLEY.



These houses are on the south side of Torrington Park. In the external design an attempt was made to give breadth, by the continuous treatment of the long roof covering bays and porches; but this arrangement, owing to the usual absurd requirements of the local bylaws in regard to parapets, was only partially successful. The double-gable form of the main roof was adopted with the object of minimising the prominence of the party wall parapet. The facing bricks used are red sand-faced, flare-burnt bricks (from Pigott, of Edmonton), with considerable variation in colour, and set with a wide mortar joint. The roofs are covered with unsorted "Sovereign" Broseley tiles, of all shades, from brindle to bright red, giving a mottled effect hardly sufficiently shown by the photograph. The front gables are rendered in cement with a floated face, and distempered. The detail is everywhere of the simplest. Internally, the newels and handrail of stairs are of oak, with square deal balusters painted white. The best door furniture is of hammered bronze, by Mr. J. Gibbons. The dining-room and drawing-room fireplaces of one house have "Bond" stoves, and a Medmenham tile surround was used in the drawing-room, where the ceiling has modelled plaster pateræ by Messrs. G. and A. Brown. All the walls are distempered with Hall's washable distemper. The contractor was Mr. W. A. Marriott, of North Finchley, and the architect Mr. Edwin Gunn, A.R.I.B.A.

Front Elevation.

View from the Garden.



TWO HOUSES AT NORTH FINCHLEY, EDWIN GUNN, A.R.I.B.A., ARCHITECT.

THE ARCHITECTURAL PROFESSION OF TO-DAY.—I.

In a recent issue of this journal we had occasion to draw attention, in general terms, to the present congested state of the architectural profession and to the appalling dearth of work among its members. We now propose to discuss in detail, from week to week, until the subject has been exhausted, the many obstacles to the advancement of his art and to his own welfare which beset the architectural practitioner of to-day. With the object of obtaining suggestions for the possible remedy of, at least, some of the grievances to which, in due course, reference will be made in these columns, we cordially invite the hearty co-operation and assistance of those of our readers who may be willing to help by supplying us with notes or comments on any points that may arise during our review of a subject which is, necessarily, one of paramount interest to all architects. Contributions, embodying suitable comments or suggestions relative to the questions under discussion, which may thus find their way to the editorial office, will be much appreciated and carefully considered. There is no doubt that the protracted period of commercial depression now being experienced in this country is slowly but surely causing many architects to realise the full significance of the unfortunate fact that, to a very considerable proportion of its members, the architectural profession, at its best rarely a lucrative one, is ceasing to afford the means of obtaining a modest livelihood. Public buildings of an architectural character, which formerly, as a matter of course, were designed by qualified architects, are now, more often than not, entrusted to public officials variously described as county or borough "architects," "engineers," and "surveyors." But whatever his designation, the designer's lack of systematic training and artistic ability is usually clearly perceptible in buildings erected under "official" auspices.

Whether this modern tendency to so often place important work in the hands of (as artists) incompetent officials is due, as many architects believe, to the sublime ignorance and indifference of the general public concerning the art of architecture, or whether, on the other hand, as some official "architects" assert, it arises because the artistic quality of the designs produced under the system of salaried employment is very often as good as that usually obtained through the medium of an independent architect can be, for the moment, disregarded. For whatever may be the cause, the broad fact remains that a very considerable proportion of the architectural work in London and the large provincial cities and towns, has been allowed to drift beyond the control of those who have devoted the best years of their life to the serious study of architecture. Again, the want of taste and lack of artistic discrimination characteristic of our nation is shown by the very general commendation of the huge edifices, designed in a style typical of bedizened vulgarity and usually entirely free from any suspicion of refinement or restraint, such as those with which, amongst others, firms of building speculators and furniture makers aided by a staff of architectural draughtsmen, are accustomed to attract an admiring public. But, strange to say, despite the immense amount of work thus regularly filched from the properly trained and experienced architect, the ranks of an already seriously over-crowded calling, are being constantly augmented by the steady influx of a large number of, in many cases, imperfectly educated and otherwise undesirable youths fresh from the so-called "Architectural Schools" or the builders' yard. Now the sole possibility of earning more than a bare living in architecture that will be open to many of these recruits lies in the adoption of methods of obtaining work which, we hope and believe, are very properly despised and ignored by the average practitioner. We allude to the system of directly advertising for work, touting for commissions, and working for less than the authorised scale of charges.

Probably no self-respecting architect will admit that men guilty of these malpractices, and acts of disloyalty to the general body, have any right to be regarded as members of his profession, but as, unfortunately, a certain section of the public thinks otherwise, and is therefore often quite content, and indeed eager, to secure the services of these tradesmen-architects, it is useless to attempt to ignore, or regard as though they were non-existent, some of the greatest hindrances to the success of the well-qualified and honourable practitioners of the day. Over and over again, attention has been drawn to the almost criminal folly of those parents and guardians who, probably attracted by the allurement of that egregious *deceptio visus*,—five per cent.,—persist in encouraging their sons and wards to become members of a profession in which, probably to a far greater extent than in any other calling, qualifications of a very diverse and manifold nature are essential to the attainment of even an ordinary amount of success.

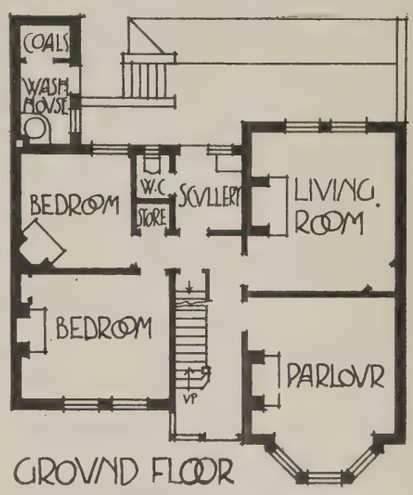
COTTAGE AT BLACKBURN, LANCASHIRE. JOHN HAWORTH, ARCHITECT.

The materials used are roughcasted walls with red brick base, the mortar joints wide. The roof is covered with Cumberland green slates and the woodwork is painted green.

We unhesitatingly recommend all such fatuous advisers of the young aspirants to the architectural profession, to "read, mark, learn, and inwardly digest" the object lesson offered by the irrefutable evidence of the general poverty which is to be found among members of the artistic fraternity. If the "blind leaders of the blind," whose conduct we are attacking, will take the trouble to consult the returns of all the persons now in receipt of Civil List pensions, their views as to the emoluments open to the votaries of art, literature, and science may be considerably modified. In a list of this nature, issued quite recently, will be found the names of the widows or daughters of many men, eminent in their day, whose dependants are now in receipt of small pensions "in consideration of their destitute condition," or "their inadequate means of support," and further striking examples of the penury too often associated with an artistic profession are to be found in the records of the Architects' Benevolent Society.

But inasmuch as the note of warning, although often raised, has hitherto been regarded as the voice of one crying in the wilderness, it has surely now become the bounden duty of all practising architects to give effect to that proclivity for self-preservation, which underlies all creature existence, by doing their best to formulate a practical working arrangement under which the inrush of undesirable embryonic architects may be effectively checked.

Should not some reasonable limit be placed upon the number of students who propose to become members of the profession through the instrumentality of the schools of architecture which have been either more or less recently instituted, or are now in course of formation throughout the country? Could not the absurdly low standard of general knowledge at present required for the entrance examinations to many of these "seats of (architectural) light and learning" be raised to the permanent advantage of the profession and possibly, who knows, to the welfare of rejected candidates themselves?



Again, it is not little less than scandalous that members of the profession who have neither any work passing through their hands, nor any tangible prospect of obtaining employment in the near future, should nevertheless be permitted to entice an unlimited number of premium bearing pupils into their work-denuded offices?

The adoption of some protective measure, whereby the professional status of architects would be ensured, and their prospects of obtaining a livelihood rendered less uncertain, ought not to present insuperable difficulties to men who, otherwise, may soon find themselves engaged in a dire struggle for their very existence. But to ensure the success of any attempt to strengthen the position of architects by means of combination and consolidation, members of the profession must, perforce, set aside their internal jealousies, dissensions, and divergent views. No measure of reform can be carried unless *whole-hearted* and *loyal* support be accorded to a policy based upon the fundamentally sound principle of securing, as far as possible, the welfare of the greatest number of those whom it is intended to benefit.

The difficulty of coping with the dangers which surround the architectural profession is increased by the fact that obstacles to progress and reform lurk both within and without the fold. Within, in consequence of the weakness and vacillation of architects themselves (of which we have hitherto heard so little) and without, through the ignorance and apathy of the public (of which we have heard so much). Evidence of the internal weakness of the profession is easily produced; for, most assuredly, any other body of professional men, having due regard to its own interests, would *long* ago have succeeded in closing its ranks to all but the properly educated and trained practitioner—would have limited, as is the case in legal fraternity, the number of articled pupils allowed to each member of the profession—would have seen to it that architectural appointments to county, city, or borough councils, were made only from among men possessing the requisite artistic qualifications, and, further, would have *insisted* that the holders of these appointments should be compelled, as a condition of service, to limit their architectural output to such buildings as naturally fall within the sphere of their official duties.

It may well be that the effect of the troublous time through which the architectural profession is now passing will serve to bring home to a large number of its erstwhile somewhat apathetic members, the absolute necessity of adopting and that soon, some means of strengthening and controlling the profession, (1) to enable its membership to be kept within reasonable limits, (2) to prevent the disgraceful practice of "underselling" followed by certain architects, and to ensure, in the future, the retention, by the architectural profession of work which at present is allowed to be diverted into the hands of building surveyors, engineers, and tradesmen.

(To be continued.)

HOUSE AT MILL HILL. EDWIN GUNN, A.R.I.B.A., ARCHITECT.

This house was built in 1905 to meet rather peculiar requirements. The first floor plan is generally similar to the ground floor, save that a bath room, w.c. and linen closet are above the scullery. The roofs are covered with Collier's sand-faced tiles, which have now weathered beautifully. There are extensive cellars under the whole house.

Proposed New Works.

The Local Government Board have decided to hold, or have recently held, as indicated by the appended dates, inquiries into proposed expenditure by public bodies as follows: — Water-supply works and plant: Margam U.D.C., £4,040 (September 17); Porthcawl U.D.C., £2,500 (September 16). Electricity works and plant: Holyhead U.D.C., no amount stated (September 16); Bury B.C., £72,000, including the provision of a new generating station at Chamber-hall (September 16); Stoke-upon-Trent Corporation, £15,365, including the extension of the supply to Fenton (September 15). Gas undertakings and plant: Huthwaite U.D.C., £250 (September 16); Glyncorrwg U.D.C., £1,300 (September 17). Sewerage, drainage, and sewage disposal works and plants: Malden and Coombe U.D.C., £800 (September 15); Luton R.D.C., £4,000, and £1,800 for Houghton Regis and Dunstable (September 22). Street improvements, new roads, public walks, and pleasure grounds: Fleetwood U.D.C., £1,360 (September 22); Crewe B.C., £296 (September 16); Chorley B.C., £3,772 (September 23); Hoylake and West Kirby, £668 (September 24); Nottingham City Council, £22,000 (September 17). Various: Gloucester City Council, for equipment, etc., of farms, £3,800, £5,000, £1,000, £2,200, and £2,400 (September 17); Penybont R.D.C., for urinals and store, £120 and £153 (September 18); Lancaster Borough Council, £650 for public lavatories and £7,065 for new town-hall site (September 15); Beeston U.D.C., £100 for public urinal (September 15); Wandsworth housing scheme (September 14).

Belfast.—The Corporation have decided to construct an open-air swimming pond in the Alexandra Park.

Birmingham.—The Erdington District Council has purchased from the Birmingham Corporation the George Road Reservoir and 33 acres of land, to be laid out as a recreation ground. A new village at Bordesley has been commenced by the Ideal Benefit Society erecting workmen's dwellings.

Bishop's Stortford.—Plans have been pased by the Urban Council for additional class-rooms at the College in Maize Green Road, and for a house in Thornfields Road for Mr. R. H. Carnell.

Bradford.—Two sewage proposals that have been under consideration by the Sewage Committee of the Bradford City Council both refer to the construction of an aqueduct to convey sewage across the valley of the Aire to the precipitation tanks on the far side of the Esholt estate. The estimated expense respectively is £75,000 and £45,000. On the ground mainly of economy (although the more costly scheme was favoured by the waterworks engineer, and had been submitted for the approval of the Local Government Board), the less expensive scheme has been adopted for recommendation to the full council. The plan now proposed embodies a steel trough upon earthen embankments, with masonry viaducts across the canal and the river, in contradistinction to an all-masonry aqueduct.

Bradford.—New Sunday-schools in connection with the Muff Field Chapel have been erected here, at a cost of £4,800, of which £2,662 has already been raised.

Bridlington.—The Board of Education have held a formal inquiry and inspected two sites suggested for a new elementary school in the Old Town.

Bromsgrove.—The Worcestershire Education Committee are about to build a secondary school at a cost of £4,000, to accommodate 150 children.

Buckhaven, Fifeshire.—A new hospital is to be erected by Lady Eva Wemyss in memory of the late Mr. Randolph Wemyss, late Provost of Buckhaven.

Burslem.—The Town Council are considering the purchase of a site in Moorland Road for a new central school for elementary and other education.

Cardiff.—The Board of Guardians are about to borrow £2,068 for alterations to the Workhouse laundry, and £850 for extensions to the hospital at the headquarters' homes.

Chingford.—The R.D.C. have passed plans for the following:—Two houses in Westward Road, for Mr. A. E. Cole; two houses in Pretoria Road, for Mr. W. Jaggard; ten houses in Royston Avenue, for Mr. T. West; one house in Connaught Avenue, for Mr. H. Marshall; 14 houses in Beresford Road, for Messrs. T. and W. Baker; alterations to existing buildings, 118, Station Road, for Mr. T. R. Bishop; alterations to existing building, the Avenue Cafe, Station Road, for Messrs. Martin Bros.; additions to the Wesleyan Church for the trustees.

Eastbourne.—The Buildings Committee of the Town Council have passed plans for the following buildings:—W. Llewellyn (R. W. Hamblyn, architect, Wm. Llewellyn, builder), pair houses, Langney Road; L. P. Newman, pair houses, Milton Road; C. C. Cottrill (F. G. Cooke, architect), detached house, Baslow Road; The Guardians of the Poor (F. G. Cooke, architect), addition, Avenue House; Leach (G. Bainbridge and Son, builders), shop front, 1, Gildridge Road; W. S. Routledge (A. A. Oakden, architect, Peerless Dennis and Co., builders), addition, Nevill House, St. Anne's Road; House; Leach (G. Bainbridge and Son, builders), addition, Stavely Cross, Stavely Road; E. H. Myddleton-Gavey (P. D. Stonham, architect, M. Martin and Sons, builders), detached house, Darley Road; Devonshire Park Co. (J. W. Woolnough, architect, T. Dunlop, builder), additional lavatory accommodation, Devonshire Park; B. Moss (W. Rawlings, builder), addition to Gymnasium, York Road; Eastbourne Steam Sanitary Laundry (Mitchell and Ford, architects, M. Martin and Sons, builders), addition to Laundry, Carlton and Latimer Roads; W. H. Speed (Mitchell and Ford, architects, M. Hookham, builder), addition, 7, Gildridge Road; Rev. W. N. Willis (F. G. Cooke, architect), alterations to St. Vincent's, Meads Road.

Evesham.—The plans of Messrs. Buckland and Farmer, Birmingham, have been adopted by the Worcestershire Education Committee for the erection of a secondary school here at an estimated cost of £8,653.

Hanley Castle.—The Worcestershire Education Committee are contributing £2,000 for the enlargement of the Grammar School.

Hunslet Moor.—A new public elementary school is to be built at an estimated cost of £15,419.

King's Norton.—The Worcestershire Education Committee are about to erect a school here, from plans prepared by Messrs. Pritchard, at an estimated cost of £14,350.

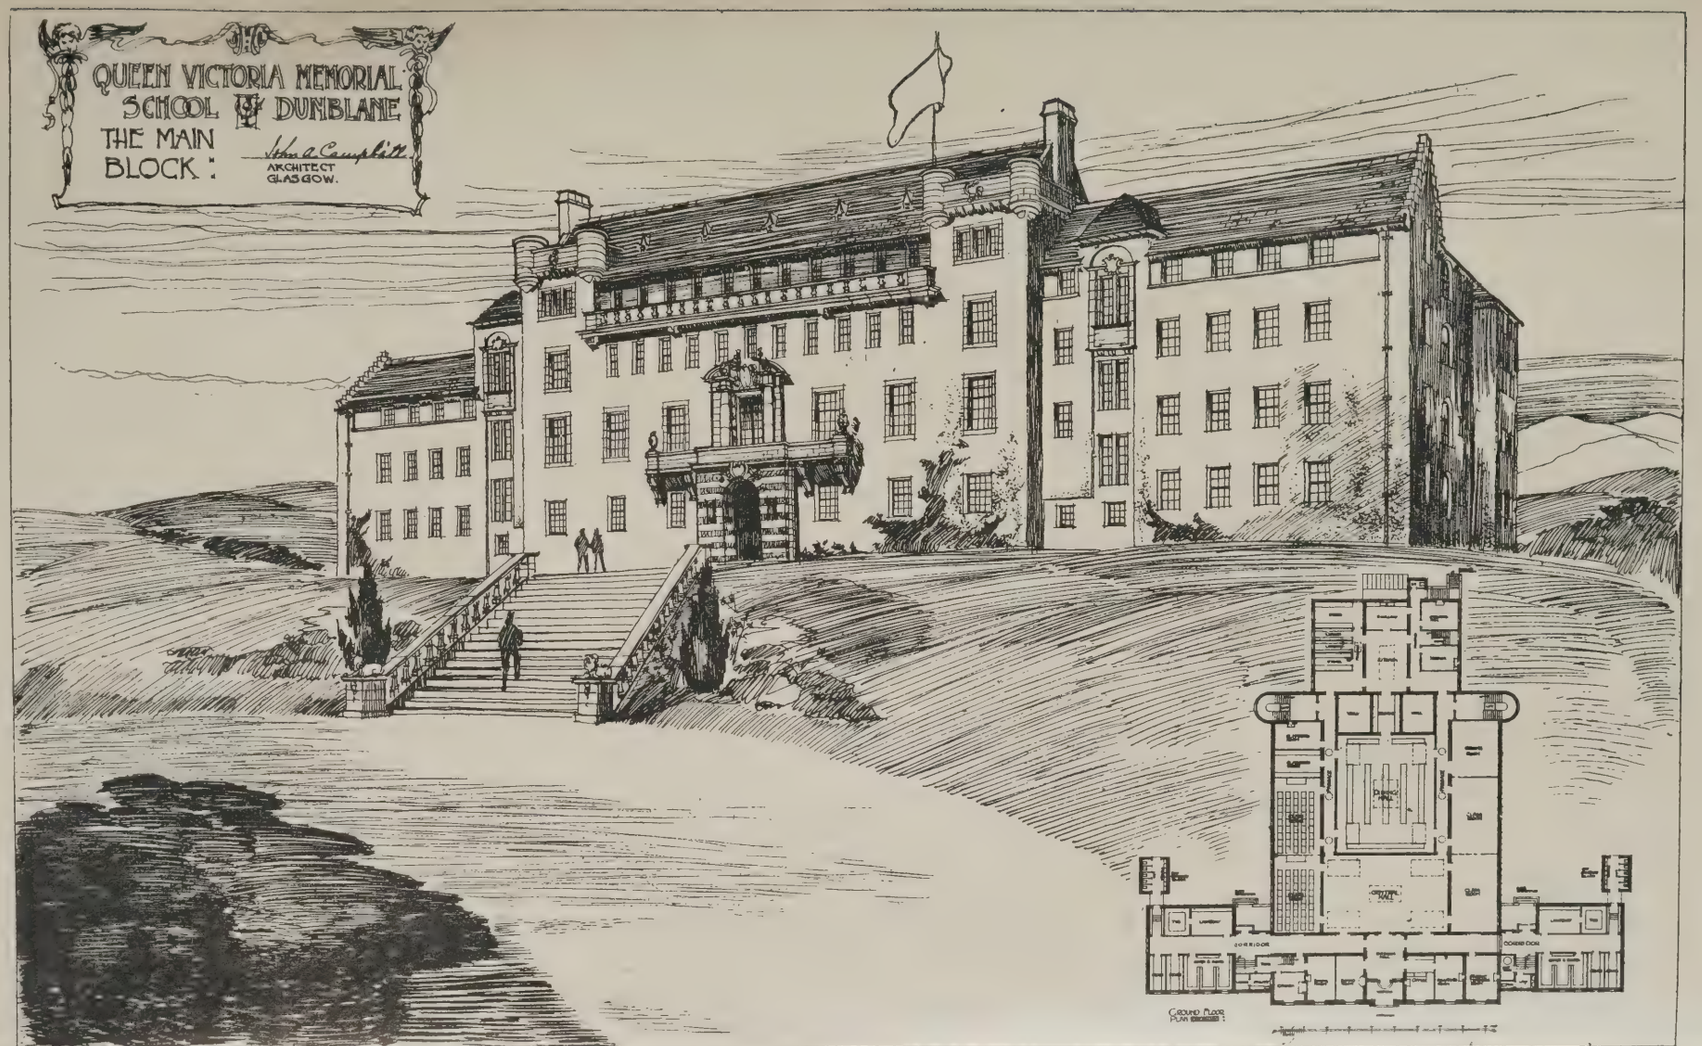
Lye.—A new school is to be erected here by the Worcestershire Education Committee.

Malton.—The plans of Mr. Walter H. Brierley, F.R.I.B.A., F.S.A., have been placed first in the competition for the new Grammar School, and recommended by the assessor to the North Riding County Council for acceptance. It is anticipated that the work of erection will soon be commenced.

Malvern Link.—The Worcestershire Education Committee are about to erect a new school here.

Manchester.—A new church house is to be erected, for which purpose a limited company, with a capital of £50,000, is being formed to provide the necessary funds. Mr. John Brooke, A.R.I.B.A., is preparing plans for the new building, which is to comprise suitable rooms for the Bishop of the Diocese, for the purpose of interviews, etc.; a large council room, with committee rooms; a large hall on the ground floor capable of seating 1,000 persons; adequate accommodation for the different diocesan organisations; and, if sufficient support is forthcoming, the provision of a church club, and a similar one for ladies, both to be fitted up on the most modern lines. Portions of the building that are not required will be let out for commercial purposes.

Newquay.—St. Michael's Church, a chapel-of-ease to St. Columb Minor, though holding 500 people, is inadequate for the needs of this growing seaside resort. A site for a new church has been bought for £545, and plans are being prepared for a new church to seat 1,000 people, and to cost about £10,000.



Portsmouth.—New quarters for the resident medical superintendent, the two resident assistant medical officers, a house for two servants, and the extension by 30 rooms, to the nurses' home, are additions to the Infirmary, decided upon by the Guardians. Messrs. Rake and Cogswell have been asked to prepare plans, and Mr. J. A. Grundy, the present clerk of the works, has been retained for the new works.

Stourbridge.—A new school is to be erected here by the Worcestershire Education Committee.

Swansea.—Plans for the following buildings and works have been approved by the Rural District Council:—Andrew Gwyther, Upper Loughor, one dwelling-house; Oliver Watkins, Gorseinon, bakery and stables; Evan Thomas, Clyndu, one dwelling house; proposed new road at Gowerton, and Thomas Morgan, Fforestfach, three dwelling houses. Amended plans:—John Jones, Loughor, one dwelling house; Dr. Frazer, Gendros, five dwelling houses; T. A. Stephens, Armine Road, five dwelling houses.

Taunton.—The Town Council have passed plans for the following works:—Additions to No. 7, Canal Road, for Mrs. Wensley; extension of St. Andrew's club-room, Rowbarton, for the vicar; drill-hall in the rear of St. Andrew's Hall, Rowbarton; temporary accommodation for the porters at King's College.

Wallsend.—The Town Council has passed plans for the following:—Thirty-two tenement houses to be built by Mr. James McHarg; proposed alterations to Nos. 36, 38, West Street for Mr. Grogan; blacksmith shop in Chestnut Street; theatre proposed to be erected in Park Road between Holly Avenue and Vine Street; six tenement houses in Charlotte Street for Mr. J. W. Moffatt.

Dunblane.—The new Queen Victoria Memorial School, erected from the plans of Mr. J. A. Campbell, Glasgow, will be opened by H.M. the King in the last week of September. The building, which is intended for the sons of soldiers and sailors, is of brick roughcast, and contains a reception hall, 46ft. by 30ft., with pitch-pine panelling and floor; a dining hall, 66ft. by 36ft., panelled in African mahogany, with kitchen department in connection; six classrooms, cloak-rooms, etc. On the upper floors are six large dormitories with 34 beds each, two with 24 beds each, and two with 14 beds each. Spray and slipper baths are provided in the bath-room. A short distance from the main building are a house for the adjutant, and eleven houses for the accommodation of the staff. The cooking is done by steam, and the main building is heated throughout by hot water. The grounds have been laid out to include a drill ground, cricket and football fields. The lighting is by gas. Mr. George Kermach was master of the works; and Messrs. G. and A. Cousin, Alloa and Edinburgh, the general contractors for the buildings and grounds, the latter being planned by Mr. McHattie, Chief Gardener to the City of Edinburgh. The water supply was planned by Mr. R. M. Christie, C.E., Dunblane, and carried out by Messrs. Casey and Darragh, of Stirling.

Winlaton.—The Ecclesiastical Commissioners have made a grant of £1,500 for a new rectory here.

Worcester.—The Worcestershire Education Committee are contributing £1,500 for the enlargement of the Grammar School.

Yardley.—The Worcestershire Education Committee have accepted the tender of Mr. Harvey Gibbs, King's Heath, amounting to £17,751, for the erection of a new Secondary school here.

Buildings in Progress and Completed.

Aberdeen.—The Aberdeen Dairy Co., Ltd., are about to extend and re-decorate, on an elaborate scale, their premises in Union Street, from the designs of Messrs. A. Marshall Mackenzie, LL.D., A.R.S.A., F.R.I.B.A., and Son. The floorings, wall linings, skirtings, counter top, etc., are to be carried out in Greek marbles, Pentelican white, Cipolino, and Skyros being the varieties employed. There will be a vaulted and enriched ceiling, and the shop-front and woodwork of mahogany. The lighting will be electric. The contractors are:—Mason work, Mr. George Hall; marble and plaster work, Messrs. James Bannochie and Sons; carpenter work, Messrs. James Garvie and Sons; painter work, Mr. John Whyte; electric lighting and plumber work, Mr. Walter Simpson.

Bolton.—A new Church House in connection with All Saints' Church has been erected at a cost of £200.

Carlisle.—At a special meeting of the Corporation Baths Committee, the tenders for the erection of public Turkish baths were submitted, and the committee eventually agreed to recommend the Council to accept the tender of Mr. W. Johnstone, Carlisle, for £22,894 11s.

Cathcart.—A new school has just been opened to accommodate 600 children. There is a manual instruction room in one block and a cookery room in the other, and a library, museum, and music rooms have also been provided. A unique feature of the plan is that each of the 22 class-rooms has a separate cloak-room entered from either the class-room or the assembly hall or the balcony, an arrangement which will greatly facilitate the easy administration of the school. The architect is Mr. Andrew Balfour, F.R.I.B.A., Glasgow, and the total estimated cost is £22,000.

Derby.—A new school for the parish of St. Joseph's. It is a one-storey building of red brick, accommodation being provided for 350 scholars. There are six class-rooms, 22 ft. by 24 ft., but by the aid of sliding partitions the whole can be made into one large room which will seat several hundreds of people, and a large stage has been erected at one end. A seventh class-room, 22 ft. by 31 ft., a teachers' room, a kitchen, and a large marching corridor, 10 ft. wide, are also included in the building. A low-pressure hot water system has been installed. The cost of the building and the site is estimated at about £5,000, and the bulk of this money has still to be raised. The architect was Mr. Eaton, of Derby, and Messrs. Richard Weston and Son, of Derby, were the builders.

Doncaster.—The Corporation have accepted the tender of Messrs. H. Arnold and Son, Doncaster, for 30 temporary cottages in Marshgate, for the accommodation, primarily, of tenants of that district dispossessed by the Marshgate Bridge scheme. The cottages will be of corrugated iron and wood, with felt roof, and will consist of a living room, scullery, and two bedrooms. The cost will be £62 each.

Dudley.—Lady Dudley laid the foundation stone on the 10th inst. of a training college at Dudley. The building is being erected at a cost of £19,000 on the parade fields, where an estate, eight acres in extent, has been secured. Accommodation will be provided for 100 students, with room for extension.

Ebbw Vale.—The foundation-stone of the new Church of St. John, Newtown, was laid recently. The building, in Early English style, will seat 500, and is to be faced with Ebbw Vale brick and Forest of Dean stone dressings. Mr. G. E. Halliday is the architect, and the Ebbw Vale Building Company, Ltd., are the contractors.

Exeter.—The memorial stone of the extensions to Hele's School will be laid by the Mayor on September 17th. The new buildings, with which rapid progress is being made, will cost more than £9,000.

Govan.—The District Lunacy Board has erected two new pavilions at the Hawkhead asylum to accommodate 120 aged and infirm patients, and a couple of blocks for the housing of nurses and attendants. The dormitories for the infirm patients are situated on either side of the administrative block, and command a splendid view of the surrounding country to the south. The pavilions consist of day rooms and dormitories, with all the most modern lavatory and sanitary arrangements, whilst they are connected with the main buildings by means of corridors. The nurses' and attendants' homes are situated to the rear of the pavilions, and consist of sitting and bedrooms. The cost has been about £25,000.

Hamilton.—A new Methodist Church is being erected near the Old Cross. The building is of stone, in Romanesque style and will cost £2,700. Mr. Alexander Cullen is the architect.

Hanley (Staffs).—Of the new Bethesda Mission Hall, which was opened here on August 27th, Mr. W. Campbell is the architect, and Mr. C. Cornes the builder.

Inverness.—The foundation stone of a new Masonic Hall, the "temple of St. Mary's C.O. Lodge, No. 339, was laid on September 4th." The Hall will form the upper part of a handsome corner block in Hamilton Street which is being erected for Mr. D. F. Macdonald from the designs of Mr. R. J. Macbeth, F.R.I.B.A.

Kingstown (Jamaica).—Messrs. William Cowlin and Son, of Bristol, have secured the contract for the new Government buildings and for the King's house, the residence of the Governor, to be erected as a consequence of the destruction of the former buildings by the recent earthquake. The contract price is mentioned as between £40,000 and £50,000. Messrs. Nicholson and Corlette, of London, are the architects.

Leeds.—The new C. S. Weatherill ward at the General Infirmary, erected under a bequest of £124,073 left by the late Mr. C. S. Weatherill, of Louis Street, Leeds, will be opened by the Lord Mayor on October 8th, and the white marble monument of the deceased gentleman, by Mr. Thomas Brock, R.A., which, under the terms of the will, is to be erected in the ward, will be unveiled on the same occasion.

Letchworth.—A new Roman Catholic Church, dedicated to St. Hugh, Bishop of Lincoln (1186-1200), has been erected in Pixmore Way. It is a plain, unpretentious, oblong building, with a small sacristy at the side, and in the event of a larger church being built at some future time, is intended to be used as a hall or school. The walls are of red brick, with tile dressings, and the south gable is surmounted with a small stone cross of Byzantine design. The walls inside are toned white, and the ceiling, which is in the form of a Gothic arch, matchboarded, is painted a dull green, with the ribs picked out in a chequered design of black, white, and red. There is a small narthex at the entrance, over which there is a gallery for the choir, lighted by a large circular window in the south end of the church. The altar vestments are of Morris tapestry and woven silk. The architect is Mr. Charles Spooner, F.R.I.B.A., and the building work has been executed by Mr. Aubrey Ellis, Willian, Letchworth.

London.—The Lord Mayor will on September 23rd unveil a memorial window to the late Alderman Sir David Evans, which has been erected at the Church of St. Andrew-by-the-Wardrobe, on the south side, overlooking the altar.

Middlesbrough.—"The Avenue" Wesleyan church and schools, which were opened at Linthorpe, Middlesbrough, on September 2nd, are built of red pressed brick, with artificial stone front and dressings, from designs by Mr. A. Forrester, Middlesbrough. Messrs. Allison Brothers, Middlesbrough, were the builders, and the cost has been rather more than £5,000.

Newcastle.—A new police station erected by the Corporation, in Wharrier Street, Walker, has just been opened. The main front is in stone up to the second floor level, and above this, and all the other elevations, are in red pressed brick with stone dressings. The roofs are slated with Newfoundland green slates. The cells are well heated and ventilated. The floors and ceilings are of Portland cement concrete, reinforced where necessary with expanded metal. The walls are in a salt glazed brick five feet high, the remainder being in a white glazed brick. The entrance halls and lavatories on the ground floor are tiled, and the remainder of this floor cement and wood block. The remaining floors are of redwood joists and flooring boards. The lavatories and drying room are of coloured cement. The whole of the building is lighted by electricity, and the cost amounts to £9,000. The contractors for the building were Messrs. Kirk and Brown, Mr. Thomas Bell acting as clerk of works. Mr. F. H. Holford, property surveyor to the Newcastle Corporation, is the architect.

Winlaton.—A new church is being built at Chopwell, the foundation stones being laid to-day. The Consett Iron Co. have made a donation of £200 towards the building.

Sunderland.—A new United Methodist Church at Paillion has just been opened. The building is of red brick, with stone facings, being a free treatment of the perpendicular Gothic, and comprises a church and small hall, having joint seating accommodation for about 450 persons, and a vestry. Messrs. Barnes and Burton, Newcastle and West Hartlepool, are the architects, and Mr. J. W. White, Sunderland, the builder.

THREE SEASIDE HOUSES. P. MORLEY HORDER, F.R.I.B.A., ARCHITECT.

HOUSE AT BEXHILL-ON-SEA. P. MORLEY HORDER, F.R.I.B.A., ARCHITECT.
(See centre plate.)

Our Plate.

We publish this week three sketch ews of houses by Mr. P. Morley Horder, R.I.B.A., which we entitled "Seaside ouses"; but, since the plate went to ess, the architect has informed us at one of the houses has been arked in error on the drawing, as being Yarmouth, whereas it is situated in-ad at Garboldisham, near Thetford. his dwelling is interesting, as showing e use made of an old Malt-House in rming a screen, and useful accommoda-n in the way of a cottage and stabling the new house at the back, connected a well-house and pergola to form an closed forecourt. The other houses eak for themselves both in point of aterial and arrangement.

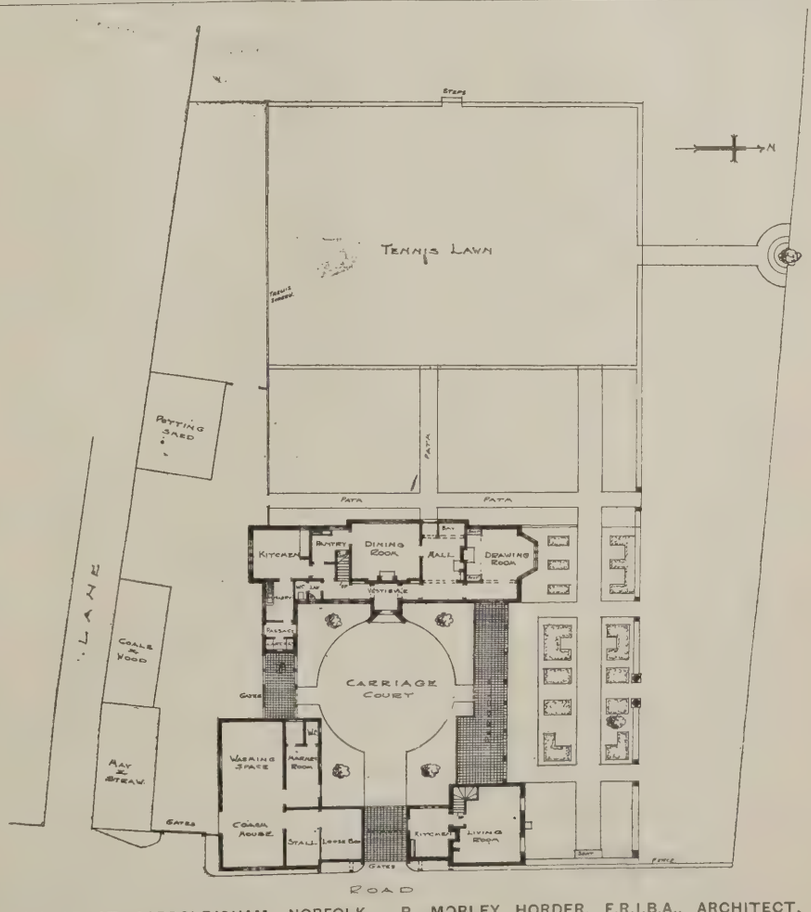
Notes and News.

London warehouses are, according to e estate agents, very difficult to let. his fact is attributed to the general ackness of trade, foreign competition, id the severity of the L.C.C. regula-ons. According to the "Evening ews," one agent reports a general drop rents of from 30 to 50 per cent., and is said that there are more to let now an at any previous time. In Upper hames Street, many of the warehouses ive been to let for six years and more, id are likely to remain so. The L.C.C. ipulations for iron, concrete, or teak aircases, in some cases also for an ex-rior fire escape, and other various ructural alterations, in warehouses hich have mostly been standing for any years, impose a heavy obligation n owners.

* * *

The British Uralite Company, Ltd., of , St. Helen's Place, London, E.C., have sued a circular describing the uses to hich Uralite Asbestos may be applied, id illustrating an asbestone structure (a ttage at the Garden City, Letchworth), id a detail plan for fixing asbestos tiles. sbestos cement slate (Asbestone) is, it is ated, adaptable not only for roofing and ning walls and ceilings, and for partition work, but also for the erection of bungalows and small portable buildings. As a non-conductor, it is useful for cable casings, switchboards, and other electric work. It weighs no more than the thinnest corrugated iron, and is not affected by chemical vapours. The company have acquired a patent for the improved manufacture of this slate, and have installed the necessary machinery at the Uralite Works at Higham. The product is, therefore, entirely manufactured in England, and the company make a point of prompt delivery.

* * *



The portico of the recently demolished Exeter Hall was purchased by the L.C.C., on the advice of Professor Beresford Pite, as an interesting specimen of Classic work, for the L.C.C. School of Building at Brixton, the price being £5. The cost of moving the specimen, which was estimated at £15, has had, according to the "Evening News," an unexpected and unfortunate result. The columns were more massive and weighty than expected, and the establature was found to be in one piece. Heavy tackle had to be requisitioned to deal with it, and a number of workmen employed for a considerable period, so that the cost of removal has amounted to no less than £105!

* * *

Mr. A. Barton Kent, chairman of G. B. Kent and Sons, Ltd., has been appointed British juror in Section 98 of the Franco-British Exhibition, for brushes, turnery, etc.

A free copy of a very useful guide to "Ornamental Decoration" is offered by Messrs. Thomas Parsons and Sons, of Long Acre, to any builder who cares to make use of the coupon that will be found with their advertisement on page xxxiii. The work, which is attractively produced and consists of a collection of designs for painters' and decorators' work, undoubtedly affords a most handy synopsis of the various accepted styles of decoration—Assyrian, Moorish,

HOUSE AT GARBOLDISHAM, NORFOLK. P. MORLEY HORDER, F.R.I.B.A., ARCHITECT.
(See centre plate.)

Pompeiian, Louis XV., Adam, and the more modern developments. It is published at 3s. 6d., but Messrs. Parsons (who, by the way, although they have been established for more than a century, are evidently adepts in up-to-date methods) have decided to offer it gratis to any builder fulfilling the conditions advertised on page xv.

Paupers as painters are objected to at Liverpool. Inmates of the Liverpool Workhouse having been employed in painting the exterior of the buildings, a deputation of house painters waited on the Select Vestry, the governing body of the Workhouse, to lodge a strong protest. The deputation mentioned that about 800 painters were out of work in Liverpool. The Guardians decided to refer the matter to a sub-committee.

* * *

The Wakefield Patent Acetylene Flare-Lights were used to illuminate the track on Friday night during the twenty-four hours' walk at the stadium of the Franco-British Exhibition on Friday and Saturday last. These lights are capable of yielding a flame of 500 to 5,000 candle power, any power required being obtainable at will. The light is remarkably pure, soft, and white, and of great diffusing power, entirely free from smoke and smell. The flame is not in any way affected by the weather, burning just as clearly in a gale as on the calmest night; and being fitted with large reflectors and swivel joints, the light can be focussed in any direction, vertically or horizontally, without moving the lamp. The Wakefield portable flare-lights were successfully employed during the recent motor race for the grand prize at Dieppe.

Views and Reviews.

Designs for Decorators.

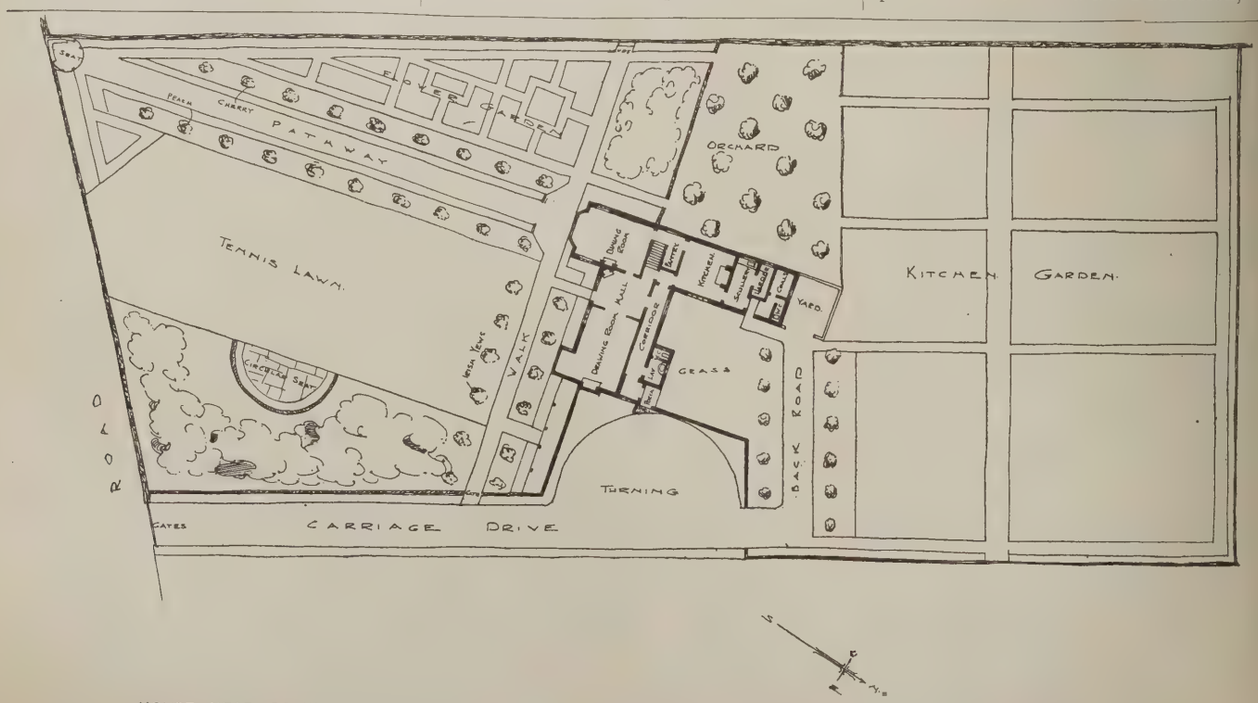
Messrs. Thos. Parsons and Sons, manufacturers of fine colours, etc., have conceived the happy idea of issuing a collection of designs and colour schemes for painters' and decorators' work, without any letterpress beyond a very brief introduction, in which it is stated that the firm are prepared to introduce artists who can do the work, as well as to supply the materials with which it can be done. The designs are suitable for a large variety of purposes, and while they are all simple, and are therefore all quite practicable by the decorator of average skill, they are nevertheless, with few if any exceptions, truly artistic in spirit and in execution. They apparently include the decorative style of every well-marked period, and the compiler, Mr. F. Scott Mitchell, may be congratulated on having produced an eminently serviceable little book; and the enterprise of Messrs. Parsons in presenting it free to customers who comply with certain easily fulfilled conditions is no less commendable.

A Few Suggestions for Ornamental Decoration. A Collection of Designs and Colour Schemes for Painters' and Decorators' Work. Compiled by F. Scott-Mitchell. Published by Thomas Parsons and Sons, 8, Endell Street, Long Acre.

YORKSHIRE MASTER BUILDERS IN BELGIUM.

Impressions of the Visit.

The visit of the Sheffield and other Yorkshire builders to Belgium will live long and happily in the memories of those who had the good fortune to experience the lavish hospitality of their Belgian friends. The Yorkshiremen had a glorious time, and it is hoped that the *entente cordiale* will be further cemented by the visit of the Belgian builders to Sheffield next year.



At the monthly meeting of the Sheffield Master Builders' Association, held at the Builders' Exchange on September 13th, the builders who went for the trip had an opportunity of explaining how they were received, what they saw, what impressed them most, and what they learned.

Mr. T. Eshelby (president of the association) occupied the chair, and immediately in front of him on the table was the cup presented to him for the association by the Mayor of Antwerp. The cup, which is a handsome production in cut glass, bearing the arms of the city and a suitable inscription, was the one from which the mayor drank the health of the party at the town hall. Its presentation marked the inauguration of a new and interesting ceremony, and the Sheffield Association is very proud to have the honour of receiving the first memento of the kind.

Arrival at Antwerp.

To Mr. A. J. Forsdike was entrusted the general description of the visit and receptions, while Mr. Biggin gave an account of the visit to the battlefield of Waterloo. It was an exceedingly difficult task, said Mr. Forsdike, to find words in which to convey to the minds of those who had not accompanied them the overwhelming cordiality of their reception everywhere. Hardly had each successive party set foot on the quays at Antwerp ere they were grasped by the hand with an even more than Yorkshire welcome, and barely had they time to dine ere they were hurried off to the Zoological Gardens, where the bands immediately struck up "God Save the King" and other patriotic airs in honour of the visit. Nine o'clock on Monday morning found them at the fine and commodious Exchange of the Antwerp Builders, where they were introduced by Sir Cecil Hertslet, the British Consul at Antwerp, to whom they were very specially indebted, and were officially received by the president of the Antwerp Association, M. Hesbain, who, speaking in English, welcomed the company to Belgium, to its artistic metropolis, and to the City of Antwerp. He (M. Hesbain) also mentioned in passing that the Mayor of Antwerp, by whom they would presently be received, had been a builder himself, and was at present an honorary president of the Antwerp Association.

Sir Cecil Hertslet followed with a complimentary speech, and expressed the pleasure he felt in the privilege of introducing his countrymen on such an auspicious occasion, and concluded by proposing the health of the president, which was heartily received. Mr. Biggin replied for the Yorkshire Federation, and

HOUSE NEAR COLWYN BAY. NORTH WALES. P. MORLEY HORDER, F.R.I.B.A., ARCHITECT. *(See centre plate.)*

paid a glowing tribute to the hospitality of their Belgian friends, whose cordiality had overwhelmed them, and said, in Mr. Biggin's inimitable fashion, that they had never felt so much honoured in their lives. Mr. Biggin then spoke of the better feeling which had latterly been engendered amongst builders, a feeling which, from the magnificence of their reception that day, was now becoming international in its scope, and which could not fail to be fruitful in results. He (Mr. Forsdike) then added a few words, and assured their Belgian friends that, despite the much-vaunted English hospitality, they (the Belgians) had completely outshone them. He concluded by extending to the Belgian builders a hearty invitation to Sheffield, and he felt sure the Sheffield Association would heartily sanction the invitation.—Councillor Dawson (Huddersfield) followed with a speech, in which he complimented the Belgians on their magnificent public buildings, which, unlike Sheffield razors, were intended to last, not for *a* time, but for *all* time. With this preamble, the party were hurried off in char-a-bancs to the town hall, where they were met by the Burgomaster, M. Hertogs. The party were here introduced by Sir Cecil Hertslet, who in a few happy phrases paid a tribute to the port and city of Antwerp. The party would see the magnificent buildings, of which the city was proud, and its railway station, with which, he was told, there were only two others in the world which could pretend to a comparison. British shipping interests in the Port of Antwerp rendered it necessary that the relations between the two countries should be amicable, and he assured the burgomaster that in receiving the company they were supremely conscious of the honour he paid them. After Mr. Eshelby, Mr. Biggin, himself (Mr. Forsdike), and the secretary (Mr. T. Smith) had been formally introduced to the mayor, the mayor, speaking in English, extended a hearty welcome to the company, mentioning in passing that he had visited London, Sheffield, Manchester, Liverpool, and other towns. The usual loyal and complimentary toasts having been honoured, the mayor inaugurated a pretty custom by presenting to Mr. Eshelby the glass from which he had drunk.

Antwerp's Magnificent Docks.

After inspecting the town hall, the party, under the guidance of Engineer Kinart, were taken for a drive over Antwerp's extensive docks, which, when the present extensions are complete, will make Antwerp by far the greatest port in the world. Two p.m. found the party back at the Builders' Exchange, where a banquet, to which 156 persons sat down, was presided over by M. Hesbain, president of the Antwerp Association. The usual patriotic and complimentary toasts were duly honoured, to the accompaniment of an excellent orchestra, which discoursed alternately English and Belgian airs, the Belgian newspapers of the following day describing our National Anthem as "The Gode Save the King." "King Edward VII." was proposed by the president, who said that Belgians would never forget the part the English nation had played in maintaining Belgian independence. Sir Cecil Hertslet proposed the health of King Leopold II., and paid a fitting tribute to the industry of the Belgian people. Speeches were also delivered by Mr. Thompson, of Dewsbury, Mr. Forsdike, and others. Even this did not end the day's festivity, for the party were once again—for the fourth time—ushered into the ever-waiting char-a-bancs, and hurried off to the docks, where the Belgian Government had kindly placed a steam launch, the "Emeraude," at the disposal of the Antwerp Builders' Association for the entertainment of their English visitors. Aboard the boat conviviality ran high, as the Belgians pointed with pride to the extensive docks and warehouses which lined the river. Nine o'clock saw the party back again; and even then sections of newmade friends divided up for complimentary dinners at different hotels. So much for one day.

Reception ot Brussels.

Tired out the party were; but Tuesday, at a quarter to nine, saw them once again at the Builders' Exchange; and afterwards they were entertained at the Zoological Gardens, where the party were photographed. At half-past twelve they left for Brussels, were hurried off in sections to hotels in various parts of the city, and met again, at three o'clock, at the Builders' Exchange, which adjoins the town hall. Here the reception was a replica of that at Antwerp, but, unfortunately, the speeches were in French, and in translation lost some of their warmness. The president of the Brussels Association, M. Delhaye, who was accompanied by the secretary, Mr. Van Ophem, said that the Belgians had always considered England as a sort of older sister, who had on several occasions protected them against the voracity of their great and powerful neighbours. For the services rendered they would always feel extremely grateful, and they could not express this gratitude better than by giving a hearty welcome to those of her children who came to visit them. In the matter of building, they did not consider themselves masters, but he thought it would nevertheless be found that the Belgians were not devoid of quality. He concluded by lifting his glass to the health of King Edward VII. and to the grandeur and prosperity of England. Alderman Jessop, J.P. (Huddersfield), in proposing the health of King Leopold II. and success to Belgium, paid a fitting tribute to the hospitality and warmth of the reception which had been accorded them. He could not speak for the National Federation, but felt sure that the Yorkshire Federation would be represented at the International Conference at Paris next month.

Brussels Buildings and Builders.

Third day (Wednesday) opened with the meeting of the whole party at the Bourse at nine o'clock, each lady and gentleman carrying a small card to frank all expenses on trams, steamboats, etc. By the kindness of M. Deschryver, director of the gigantic Maritime Installations, the party were personally conducted over the enormous Custom Houses, and were amazed by the size and up-to-dateness of everything they saw. Leaving the works, they arrived at Leaken, where a steamboat was waiting to take them over some of the prettiest river scenery. A thunderstorm, however, caused abandonment of the excursion. The party subsequently went by tramway through some of Belgium's most lovely scenery to Terveuren, where a banquet was awaiting them in the Restaurant Sevin in the park. A couple of hours were spent in feasting and "speechifying."

Mr. Forsdike averred that his description of the proceedings had given but a faint idea of the receptions they had. The visit had surprised them. Brussels was fine enough to be the capital of a country much larger than Belgium, and its industries were on a scale commensurate with a great nation. The organisation of its builders was much better than their own. Antwerp, a city about the size of Sheffield, had 530 members in its association, and last year added 100 members. The executive Board was principally composed of contractors, although the members included all branches of the trade. The number of employees represented by the association was 30,000. The wages paid to workmen were only about 4d. per hour, but against this was to be set the cheapness of living, which accounted for much of the difference. The working hours prior to the recent strike were 12 per day, 6.30 a.m. to 6.30 p.m., with one hour interval for meals, while on Saturdays work ceased at 5.30. He wondered where our English football and cricket matches would be with these working hours. The organisation was superb, not only did the Antwerp builders organise their own Workmen's Compensation Insurance, but they actually had their own solicitors, their own doctors, and their own hospital. There could be no possible quibbles about compensation, as the compensation for almost every conceivable accident was stipulated by law, and from it there was no appeal. The loss of a finger, a hand or a foot, meant so much compensation according to earnings. The premium charged by the association was four per cent. on wages, which was the same as that charged by the insurance companies. From the premium the association had already piled up a reserve of 2,000,000 francs, and last year a rebate of 30 per cent. was made to all members, whether they had had an accident or not. Although insurance was not compulsory, an employer whose workman was injured permanently would be required by the State to deposit with them such capital sum as would realise sufficient interest to pay the indemnity to the workman. At Brussels the association numbered 251. They had not their own insurance company, but had made special arrangements to insure collectively at two per cent. to cover compensation, medical liability, and third party risks.

Turning to general impressions, Mr. Forsdike spoke of the remarkable achievements of Belgian builders. The custom houses, over which they were conducted by M. Deschryver, had cost £280,000, and had been completely erected in eighteen months by 300 workmen, and the accomplishment would appear all the greater when it was remembered that the whole buildings were erected on quicksand, which had previously to be treated with piles and reinforced concrete to obtain a foundation. Another interesting feature was that French, Dutch, and German contractors often tendered for work there, but there was no instance on record of an English contractor having tendered.

Belgium's Wide Streets.

One's general impression of the streets was that they were much wider and finer than ours, and there were miles and miles of buildings with plastered fronts, painted every year, which gave a light and pleasing air to the cities. There were many humorous happenings in connection with the visit, but time forbade

SHEFFIELD AND YORKSHIRE BUILDERS AT BRUSSELS.

him to recount them. Altogether it was one of the most pleasing and instructive holidays he had ever spent.

Subsidised Buildings.

Mr. J. Biggin (president of the Yorkshire Federation), gave a graphic account of the visit to the battlefield of Waterloo, remarking incidentally that both on the journey and on the battlefield they met with the same cordiality as had been described by Mr. Forsdike. A fact which struck him everywhere was the size and ornamentation of the buildings, which, it apeared, were inconsistent with the amount of business which would return an adequate rental. The same observation applied to the theatres, of which the magnificent Théâtre Flamand, at Antwerp, was a typical example, and was the finest building of the kind he had ever seen. On enquiry, they found that the beauty of many of the buildings was due to the fact that they were subsidised. Theatres were considered public necessities, and were not expected to pay their way. He had innocently enquired what dividend the Builders' Exchange at Antwerp paid, but he was met with a smile. They didn't expect it to pay its way was the significant reply. What they wanted was an Exchange, for which they were prepared to pay. In many things Belgium was ahead of them, while in others he thought we still held our own. One fact, however, was very noticeable. At the post office he noted that old-age pensions were actually being paid while we were only just emerging from the "legislatory" stage.

The President (Mr. Eshelby) then produced the cup presented by the Mayor of Antwerp, and the company drank to the health of the Belgian builders.

Presentation to the Organiser.

An interesting event in connection with the visit took place on the Thursday evening at the Hotel de la Marine, Brussels, where the whole company assembled and presented to Mr. Thomas Smith (secretary of the Sheffield Association), who had organised the visit, a handsome dressing-case and silver-mounted walking stick, together with a quantity of Brussels lace to be handed to Mrs. Smith.

Correspondence.

Out-of-work Architects.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—May I point out that the remedy for the present unsatisfactory and distressing state of affairs among architects does not lie in closing the schools, registration or the elimination of the remittance man? One has only to glance at a newspaper or speak to one's friends to find that unemployment is not by any means confined to the architectural profession. It is, in fact, rampant in all professions, trades, and businesses. It is useless to tell the young man or his parents and guardians that there is not even standing room in the profession when all other walks of life are in the same state. The closing of the profession by Act of Parliament will not find work for the unemployed, but will make it practically a monopoly of the wealthy classes. The real cause of unemployment among architects and their assistants is the same as among all other working classes, namely, the private ownership of social necessities by a small class, who work and control them for their own profit, and not for the general well-being of all. The remedy lies in the social ownership and control of social necessities, architecture included, to be worked for the benefit of the whole community, and not for any one class. The sooner architects individually and collectively recognise this and join hands with the growing forces of Socialism the better it will be for themselves and for their art.

Yours truly,
A YOUNG ARCHITECT.

[There is much truth, no doubt, in our correspondent's remarks on unemployment generally. But we are not convinced that he has found the real remedy, and if, as Kipling has it—

"There are nine and sixty ways
"Of constructing tribal lays
"And—every—single—one—of—them—is—right,"

there are about nine hundred and sixty different explanations of Socialism, from the mild benevolence of Mr. H. G. Wells to the quite uncompromising rigour of, say, Mr. Jack Williams, all of which, according to their respective authors, are right. And our columns *are not open* for discussing their merits or demerits. —ED. B.J.]

Law Cases.

Arbitration Awards.

A building arbitration, as between Messrs. Pye, Parkinson, and Co., Ltd., builders, and Mr. Isaac Gale, provision merchant, was heard at the Hotel Metropole, Swansea, recently, before Mr. Ernest H. Leeder as sole arbitrator. Messrs. Pye, Parkinson, and Co. claimed from Mr. Isaac Gale, High Street, Swansea, £385, the amount of the architect's (Mr. Basil C. Deacon, of Liverpool) final certificate under a contract for the erection of two villas at Kingston Road, Coedsaeson, Sketty, for Mr. Gale. Mr. Gale repudiated liability for this sum and counterclaimed against Messrs. Pye, Parkinson, and Co. for about £1,300 in respect of alleged (1) excessive prices, (2) reductions not credited, and (3) breach of contract respecting work, workmanship and materials. Mr. Ernest H. Leeder has now made his award, which is as follows —1. Mr. Isaac Gale to pay Messrs. Pye, Parkinson, and Co., Ltd., the sum of £272 6s. 2½d. forthwith in full satisfaction and discharge, and as a final determination of all disputes between the parties. 2. Mr. Isaac Gale to pay his own costs and also two-thirds of the costs of Messrs. Pye, Parkinson, and Co., Ltd., of and incidental to the agreement of reference, the arbitration and the award.—Recently, Mr. David Morgan, of the firm of Messrs. James and Morgan, sat as arbitrator in a claim by Mr. T. P. Howells, builder, Cardiff, against the Llanbradach Building Club Company in respect of a number of houses built in Garden Street, Llanbradach. The arbitrator has now given his award in favour of the plaintiff, Mr. Howells. The defendants are to pay him £360 in full satisfaction of all claims.

Occupation Without Certificate.

At Keighley, William Coleman, builder, was summoned by the Keighley Corporation for permitting a house to be occupied without first obtaining a certificate of fitness.—It was stated that on June 6th

1907, the defendant submitted plans to the council for thirteen houses which he proposed to build in Lawkholme Lane. These plans were duly approved, and eight of the houses were erected. On June 19th, 1908, Cornelius Pickles, the assistant buildings inspector, found that the houses were occupied. It appeared that this particular house (152, Lawkholme Lane) had been occupied from June 1st. Regulation 40 in the schedule of the Keighley Waterworks Improvement Act, 1872, provides that no new house should be occupied until it had been certified by the local board or its officer to be in every respect fit for human habitation. If this regulation was not complied with, the penalty was not exceeding £5, with a continuing penalty of 40s. a day. When Mr. Pickles visited the premises no application had been received for a certificate, and the house was not completed. But even if the house had been completed, it would still have been an offence to permit it to be occupied without a certificate having been obtained. In this house, the cellar area in Hard Ings Lane had not been cemented, as was required by the Health Department, no ventilator had been fixed in the outer wall near the floor of the sitting room in Lawkholme Lane, and the prismatic lights had not been placed over the area. The object of the regulations was to ensure that people should not live in houses which were not fit for habitation, and it was the duty of the Corporation to see that the regulations were enforced, though it was a number of years since the Corporation took action in a case like this. During the last two or three years, however, they had had considerable trouble with builders. In many cases where builders had not obtained certificates the houses have been unfit for habitation.—Defendant made a statement to the effect that it was not his fault that the prismatic lights were not yet fixed. The cellar was cemented. He admitted that the house was occupied, and that he had not obtained a certificate.—A fine of 1s. and costs was imposed.

Obstructing Public Roads with Building Materials.

At Watford Petty Sessions, Aaron Jones, builder, was summoned for causing an obstruction in King Edward's Road, New Bushey.—A police-constable gave evidence to the effect that while on duty in the road in question he saw a quantity of building material on the footpath and a portion on the roadway. Defendant's attention was called to the obstruction, and he was asked to remove it. A stack of bricks completely covered the footpath and 3ft. of the road. Defendant told the constable that he could not remove the stuff until he had finished building. A fire hydrant was covered by a quantity of timber.—For the defence, it was urged that where builders were engaged in work they were generally allowed a little latitude in placing material on the paths and roads.—The Chairman of the Bench said that with the consent of the local authority builders were often allowed to place materials on paths, and even encroach a little on the road. The case was really a matter for Mr. Jones and the local authority. He added that Mr. Jones, legally, was in the wrong. His proper course was to get the consent of the Urban District Council to allow him to place his building materials on the path or road.—The Bench ordered the defendant to pay costs of the case.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

The querist's name and address must always be given, not necessarily for publication.

R.S. Joists and Concrete Floors.

MANCHESTER. — MANCHESTER writes: Would you give me a simple method and formula for calculating the thickness of concrete to a floor composed of concrete and R.S. bearers? The R.S. bearers spaced 4ft. centres, and supported every 12tt. on girders. I know the various weights and loads (in this case a school floor) to allow per square foot, but do not know how to arrive at the necessary thickness of concrete; also would the same formula apply were the R.S. bearers spaced 8ft. centres, or even wider spaced, as long as the concrete is strong enough to take the load it has to bear? Would you also give the working out of the formula in figures when applied to the floor width with R.S.B.'s spaced 4ft. centres?

There has been, so far as we know, no investigation of the subject which will help us to calculate, except in the most empirical manner, the strength of a floor reinforced with rolled steel joists embedded in concrete. The practice has been to place small joists close together, not exceeding 2ft. centres, and to estimate them to carry 50 per cent. more load than the strength of a free joist. Unless the joists are very small, and the concrete very thick, the service of the latter will not be to add strength as regards resistance to crushing, but only to prevent buckling in the joist. With a free joist the depth should never be less than one-twentieth of the span, but in a concrete floor this can be considerably reduced, because the joists are supported laterally against buckling. The concrete also causes the deflection to be less than would be the case if the joists were free, so that we are enabled to use sections which would be considered too slight for sustaining the load in question in the ordinary way.

Rolled steel joists might be placed at 4ft. centres, but it would be unwise to place them at 8ft. centres, unless the slab of concrete between were reinforced with rods or expanded metal. However, the ordinary steel joist and concrete floor is very much out of date, and our correspondent will find it more economical and more satisfactory to employ reinforced concrete.

Cost of Concrete Building.

WHITLEY.—CONCRETE writes: (a) Can you kindly give me a rough idea of comparative cost of walling of—(1) common brickwork, roughcast outside, plastered inside; (2) concrete blocks, made by hand on site, roughcast outside, and plastered inside. N.B. Sand is on site. In a small town common bricks cost about 35s. per 1,000 delivered. (b) What are comparative costs of—(1) ordinary wooden joisted floors (spans up to 15ft); (2) concrete floors (say 4in.) reinforced with expended metal conditions as above. (c) Would walls built of concrete blocks 12in. thick, roughcast outside and plastered inside, be as impervious to damp getting through, as a 14in. solid brick wall (not roughcast)?

(a) It is only possible to give the roughest approximate cost of the two systems of building. We think that the cost under the conditions named would be about equal. (b) The cost is materially affected by the size of the building and the number of floors it contains. For instance, if there are several floors to be constructed of reinforced concrete, the centering can be used several times over, but if there are only one or two floors the cost of the centering is proportionately higher. For ordinary dwelling houses we should place the cost of reinforced concrete floor as almost about equal to wooden floors, but for buildings with four or more storeys and for heavy loading the advantage is in favour of reinforced concrete. (c) Yes, certainly; concrete walls as described would be superior to a 14in. solid brick wall.

Study of Reinforced Concrete.

NORWICH.—J. C. H. writes: Can you give me the name or names of engineers who teach by correspondence the subject of reinforced concrete, as applied to buildings, retaining walls, bridges, and the like, as I wish to take up this subject at once? Also please advise me of suitable books on this subject, with their respective prices and publishers.

We do not know of any engineers who make a speciality of teaching the subject of reinforced concrete by correspondence. The subject is taught in a general way by The International Correspondence Schools, Chancery Lane. As regards books on the subject, the standard work is "Reinforced Concrete," by Charles F. Marsh and William Dunn, 31s. 6d. net. Other good books are "Principles of Reinforced Concrete Construction," by Turneaure and Maurer, 12s. 6d. net, and "Reinforced Concrete Construction," by Buel and Hill, 21s. net. There is also "Concrete Steel," by W. Noble Twelvetrees, price 6s. net. A useful pocket book on the subject is the "Manual of Reinforced Concrete," by Marsh and Dunn, price 7s. 6d. net. Considerable space also is given in "Specification No. 11," 4s. 3d., to the subject. These books can be obtained post free for the prices named from our offices.

Grey Stocks.

CHELLASTON.—BRICKS writes: Could you give me the address of a firm of brickmakers in the Midlands, who supply the grey stock bricks, similar to those used in Clive House, Roehampton, Surrey, which is illustrated in the BUILDERS' JOURNAL for September 2nd?

We have made enquiries, but cannot discover any Midland brickworks producing bricks of the colour used at Roehampton, which the architect informs us came from Guildford. You could get Lutons, but they are not pleasant in colour.

Measuring-up.

HECKMONDWIKE.—J. B. A. writes: "Can you give me any information as to measuring-up at the conclusion of a contract? Can an architect measure up the whole building from foundations to roof, including excavating, when the specification or contract does not provide for it? It so happens that the architect has given over-measure in most of the items, but the clerk of the works is measuring up the whole again, and taking all the extra measure off, and the deductions will be as much again in amount as the additions. There is the usual clause that any additions or reductions shall not invalidate the contract, but that they shall be added or deducted, as the case may be. I have always understood that if a building is to be remeasured throughout it should be specially stated. If I am bound to

submit, the work will prove a serious loss to me. I may state that the contract price is about £4,000."

Everything would appear to depend on the wording of the actual clauses embodied in the contract and specification; and where a building is to be erected on a priced bill of quantities, it is usual to provide that the building will be measured up on completion, and paid for at the rates for the various works given in the bill of quantities. But, without any of the documents before us, the best advice that we can offer is that you had better consult your solicitor.

New Factories in London.

LONDON, E.C.—P. and B. write: "Could you give us a list of factories recently erected and in course of erection in or near London?"

If you will apply to Mr. S. H. Knyvett, Deputy Chief Inspector of Factories, Home Office, Whitehall, S.W., we think that he will be able to give you the information you require.

Removing Stains from Brickwork.

OLDHAM.—B. U. B. writes: "Please suggest a method of removing stains on Accrington bricks, caused by repointing on the weather side with mastic and oil."

(1) The composition of the mastic is not stated, but if it has a base of litharge and linseed oil, and the stains take the form of a partial darkening of the bricks owing to absorption of oil, it may be best to give the face of brickwork a coat of raw and boiled oil, to bring it all to the same tone. It would perhaps be possible, however, to remove the stains, though without more precise particulars it is difficult to say. Try a paste composed of 1 part liquid ammonia, 1 gallon soft soap, 2lb. powdered pumice. Dust the face of the brickwork, and apply a coat of the mixture with a brush. Let it remain for 20 minutes, then scrub it off with a scrubbing brush and water, and, finally, rinse with a hose. G.

OLDHAM.—B. U. B. writes: "Please recommend a good treatise on the construction of piggeries."

Information as to piggeries may be obtained from "Farm Buildings," by A. Dudley Clarke, F.S.I., published by B. T. Batsford, 94, High Holborn, W.C., at 6s. net. Some illustrations are also given in a book entitled "Farms," by R. S. Burn, one of a series on "Practical Architecture," now, it is believed, out of print. Though Burn's book is about 50 years old, it contains useful information. The most recent practice will be described in a book shortly to be issued by the publishers of "Concrete," 57, Moorgate Street, E.C., dealing with the various uses of concrete about the farm. G.

Sewerage.

TAUNTON.—LEARNER enquires about a book on sewerage. If he will forward his name and address as enjoined in the notices at the head of this column, we will deal with the matter.

Architect as Insurance Agent.

PORTSMOUTH.—INSURE writes: "Is it against professional etiquette for an architect to act as agent to an insurance company? Would an architect who so acted be barred from becoming an Associate of the R.I.B.A., or similar body?"

We see no reason against the proposal, providing the insurance agency was not made a medium for advertising the profession of architect. On the latter point it would be necessary to consult the secretary of the R.I.B.A. We know of no ruling on the subject; but we imagine that the R.I.B.A. would prefer that their members confined their attentions to architecture.

Responsibility for L.C.C. Fire Risk Requirements.

LONDON, W.C.—W. writes: "In February last the London County Council served my client, the freeholder of a shop in the County of London, with a notice, under Section 10 of the London Building Acts (Amendment) Act, 1905, requiring:—(1) A trap-door to be put in the roof; (2) a self-closing fire-resisting door; and (3) a notice calling attention to the necessity of maintaining the means of escape to be attended to. It is clear that the requisition of the Council must be complied with, and a question has arisen as to whom the expense falls on. The freeholder has let the premises on lease for twenty-one years, and under the same the lessee covenants to execute all works and comply with all sanitary and other regulations required or imposed by competent authority upon or in respect of the premises. The lessee is further required to well and substantially rebuild, repair the premises, and deliver up the same so well and substantially repaired, etc. Kindly advise whether the expense of complying with the London County Council's requirements should fall upon the lessor, who is the freeholder, or the lessee. I am not aware of any decision on the point, but consider that the lessee must bear the expense."

I am of opinion that the whole of the expenditure mentioned must legally fall on the lessee only. It was decided in the case of "Greaves v. Whitmarsh, Watson, and Co., Ltd.," in 1906, that under a covenant in a lease to pay "all rates, taxes, and outgoings" the lessee is liable for the cost of paving works incurred under Section 150 of the Public Health Act, 1875 (L.R. (1906) K.B. 340)—a case almost on all fours with your case. On the other hand, a county court judge has been known to apportion similar charges between lessor and lessee—see "Weld v. Clayton-le-Moors U.D.C.," as reported in the "Estates Gazette" of March 8, 1902.

F.S.I.

Water Supply for Country Cottage.

WINSLOW, BUCKS.—B. S. writes: "(1) Having approved plans with the proposed water-supply stated thereon, and also described in writing as being within reasonable distance (less than 200 yards) from the site, is it legal for the Council now to refuse to grant the water certificate under their statutory powers? (2) Has any decision been given by any stipendiary magistrate or higher court as to what may be considered a 'reasonable' distance from which to fetch drinking water where there is only a well-and-pump supply of water in a village? If so, what is that reasonable distance? (3) Is it not a fact that a properly filtered rain-water supply has been held to be 'an available supply of wholesome water sufficient for the consumption and use for domestic purposes of the inmates of a house,' when the storage tank has been properly ventilated? In the case mentioned it is extremely doubtful whether, if a well was sunk on the property, an unpolluted supply could be guaranteed."

(1) I fear there is no doubt that the Rural District Council are within their legal rights—the by-laws are one thing, and the water certificate is another—in fact, the water certificate is a necessity even in districts where there are no by-laws. (2) I think no decision has been given naming a certain distance as being "reasonable" or otherwise—every case is decided upon its merits, and the tendency is certainly to greater stringency and much less "reasonableness." (3) Certainly a tank supply may be certified as sufficient, and a "water certificate" granted in respect of it, but, of course, it is of no use to have a larger tank than can be supplied from the available roof area. F. S. I.

Capacity of a Sheep Dipping Tank.

SHERBORNE.—B. R. M. writes: "Please inform me what quantity of water the sheep dip and steps (in accompanying sketch, not reproduced) will hold; also the rise for every 50 gal., so that I can make a gauge-rod for my customer to add chemicals according to the quantity of water in the dip."

Every cubic foot of space contains 6.235 gal. of liquid, or approximately 6¼ gal. Each foot in height of your tank (disregarding the steps) will, therefore, hold about 131 gal., and the total capacity (including the steps) may be taken as nearly as possible at 590 gal. F. S. I.

Arresting Decay in Wood.

TAUNTON.—S. P. writes: "Some village stocks which have come under our notice are in bad condition. They are exposed to all weathers, and consequently have become decayed. Can you suggest anything to arrest this? We have thought of using sideroleum or some similar preservative."

It would be better, of course, if the stocks were preserved under cover; but if this is not possible a treatment such as you suggest, with a preservative like carbolineum (Messrs. C. A. Peters, Ltd., 116, Newgate Street, E.C.), would be effectual.

Qualifying as Quantity Surveyor.

WARRINGTON.—W.F. writes: "I am desirous of taking up quantity surveying and civil engineering. Please advise."

A youth wishing to join this profession should serve, for a term of four or five years, as articled pupil to a quantity surveyor of repute, and should, having passed their preliminary examination, become a student of either the Surveyors' Institution (12, Great George Street, Westminster) or the Quantity Surveyors' Association (Caxton House, Westminster). He should, in addition, during his term of service, attend evening classes in building construction, and should then have no difficulty in passing the intermediate examination, qualifying for the Associateship of the Surveyors' Institution, before the expiration of his articles. A few more years' experience as paid assistant would enable him to pass either the final examination of the Surveyors' Institution, or that of the Quantity Surveyors' Association. Both the Quantity Surveyors' Association and the Surveyors' Institution hold examinations that are open to non-student candidates, and that are also (for the present) open to those who have not served articles. Particulars can be obtained from the secretary of either society. Candidates for these examinations, however, when applying for permission to sit, must produce such evidence of their training and education as is satisfactory to the respective councils. A. G. C.

CONTRACTORS' SECTION

(MONTHLY).

THE NATIONAL FEDERATION AND ITS BENEFITS TO BUILDING TRADE EMPLOYERS.

One of the most interesting and important phases of sociology is the gradual transition of human beings from the condition of isolated individuals into corporate existence. We are able to trace the progress of man from his prehistoric and dangerous isolation to the formation of the family; the aggregation of families into tribes; the massing of tribes into nations. And in the history of each nation we find the banding together of men with common interests—as witness the old craft guilds—a tendency somewhat set back with the advent of machinery, but at the present day more strongly developed than ever. Thus we find the gradual aggregation of populations in towns and cities, the initiation of Institutes and Societies for professional interests, business men, banding into limited companies, limited companies into trusts, firms forming trade associations, and trade associations, with common interests, forming federations of those trade associations.

Federation an Inevitable Development.

By such a long train of circumstances do we arrive at the National Federation of Building Trade Employers of Great Britain and Ireland, a product of sociological evolution. For the formation of such bodies does not happen fortuitously, or at the mere casual desire of a certain number of individuals, but by the compelling law of common needs, common interests and common welfare which draws them together for mutual help and co-operation. In other words, it is the inevitable necessity of this co-operation which forces it into being, and those building trades employers who have yet to join an Association would do well to ponder the fact.

What are the Benefits?

But the average man will rejoin that granted our premises, and assuming the inevitable necessity of trade co-operation, the advantage to the individual in joining such a movement yet remains to be proved; in short, what are the benefits to be derived by joining? Now, this is a common enquiry, and though the advantages are many, they need to be carefully enumerated.

Protection from Employees.

It will be sufficiently obvious to an enquirer that the very forces which have brought the Building Trades Employers' Federation into existence are able to bring other trade organisations into existence which may be in some degree antagonistic to the Association whose advantages he desires to consider. Such organisations may control the production of the materials which he uses, the actions and wages of the workmen he employs, or the conditions under which his work is carried out. For instance, in the matter of workmen, the Federation gives protection against aggressions or coercions by the workmen or their Unions. Nothing is more possible than that a workman's Union may, in furthering the supposed interests of its members, inflict very grevious loss or damage on a building trade employer, and, individually, his chances of gaining redress are absolutely nil. Moreover, the law has recently been altered very greatly in favour of Trades Unions, so that for actual intimidation or destruction of property by workmen, even if done under the direct incitement of their Union officials, the employer has no redress against the Union, as the Unions are not now responsible for torts committed by their members. They may strike and picket his premises to prevent other men working for him; but if he endeavours to protect his workmen by a system of counter-pickets he becomes personally liable for any torts committed by his pickets *unless he is a member of a Union or Association of Employers.* Such an Association or Union enjoys the same privilege in this respect as the workmen's Unions, and thus membership of an Association confers a very substantial benefit and protection to the employer.

Conciliation Advantages.

Trade disputes, while not always proceeding to the extremity of a strike, may occasion much difficulty and friction between an employer and his men, and here again membership of an Association confers on an individual employer the advantages of the conciliation arrangements existing between the National Federation and the three leading Operatives' Unions, viz., the masons, bricklayers, and joiners, together with the analogous agreement with the National Association of Plasterers, so that the dispute may be settled amicably and fairly between the two parties. And in this we have a second very substantial benefit.

Contract Coercion.

The aggression of workmen or their Unions is not the only form of coercion to which the individual employer may be subject. There are the possible impositions of others controlling the conditions under which he works. Architects and public bodies, in furthering the interests of their clients or the ratepayers, may seek to impose harsh and unconscionable conditions in their contracts. But membership of an affiliated local Association confers the right to use the national form of contract, the provisions of which are backed by the support and moral influence of the National Federation, who may also invoke the support of the Royal Institute of British Architects and the Institute of Builders in the same direction. This confers a third substantial benefit.

Workmen's Compensation.

Similarly the individual employer may have to cope with the imposition of unfair conditions and rates of insurance for workmen's compensation, and needless to say his legal liability in this respect is a very onerous one, making insurance against the risk an absolute necessity. A local Association can arrange, either directly or through its County Federation, for a collective bargain as to rates of insurance and fair terms of policy, and the benefit thus secured is a very real and financially advantageous one, often saving an employer in premiums many times the amount of his Association subscription, and obtaining for him a real instead of a fancied security from the various eventualities of compensation law. This is a fourth substantial benefit.

Inter-trading.

As one of the advantages of co-operation among the employers may be mentioned the inter-trading rule or custom which can be adopted by an Association, and secures preferential dealing as against outsiders. This privilege, if properly utilised by builders, sub-contractors, merchants, and dealers, may be made most valuable, while it does not interfere with fair competition, or foster the formation of rings, the bolstering-up of prices or other undesirable developments. This constitutes the fifth substantial benefit.

"Union is Strength."

It is an old saying that "union is strength," and if the general, moral and intellectual benefit resulting from the feeling of solidarity with the rest of the trade is less tangible than the other benefits already set forth, it is none the less real. For in this complex and restless age it is the worry that kills, and worry is largely produced by sub-conscious fear of risks which must be incurred, and which are inseparable from the conduct of building operations. But if some of the most serious of these risks are, as has been already shown, minimised or eliminated by the arrangements made or protection offered for the benefit of its members by an Association or the Federation behind it, it is obvious that membership in this respect alone confers a sixth substantial benefit on the individual employer, who has, also, the added advantages of social and friendly intercourse with other members, the opportunities for acquiring information or obtaining advice, and enjoying a sense of independence of outside influences which his membership confers.

Benefits to Come."

The advantages to which we have already drawn attention do not, however, exhaust the possibilities which may accrue to the individual employer through membership of a local Association. The important benefits already obtainable are probably in number but a tithe of those which will eventuate through the efforts of such an organisation as the National Federation. Even in this very number we indicate two important developments which may have far-reaching consequences on future building operations. Reinforced concrete, which the London County Council will shortly place among the ordinary methods of construction controlled by the provisions of the London Building Act, may affect the operations of the average contractor in several directions, some of which we have endeavoured to indicate in our article. The increasing tendency for the direct employment of specialist contractors, to which we draw attention in another article, may also have to be reckoned with. But over and beyond these developments from within the individual employer has also to take account of many developments from without. The ever-increasing number of laws based on

the desire for social reforms and the amelioration of social evils are fraught with possibilities that the individual has neither time to study nor the ability to cope with, but which may nevertheless inflict very real and unnecessary hardship upon him. Without some central organisation, such as the National Federation, to keep a watchful eye upon the many legislative proposals that are placed before Parliament, and to take action against proposed enactments which threaten to infringe the rights and liberties of building trade employers, and which may have been directly promoted for that very purpose by an antagonistic organisation, the individual employer would, without doubt, fare very badly. And in addition to the great advantages conferred by the National Federation in resisting aggressive enactments is also to be reckoned its ability to influence, modify, or initiate changes in the law for the benefit of building employers, which its representative character and organisation renders possible. This power, much more real than might be imagined, will strengthen as its organisation develops, and it becomes, therefore, the duty and the privilege of every individual employer to join this great organisation that the Federation, when moved to action for the promotion of legislation or the redress of grievances, may in truth be said to include and represent every building trade employer within the limits of the United Kingdom. For the building trades form the second largest community in the United Kingdom, and, although employers and employed may have their own difficulties in interworking, their union on questions of policy affecting matters of mutual interest, would present in the councils of the nation an incalculable and far-reaching force.

HOUSING AND TOWN PLANNING.

"Housing and Town Planning in Liverpool" was the title of a paper read by Dr. A. A. Mussen, medical officer of health for Liverpool, at the Sanitary Inspectors' Conference on Wednesday last. Dr. Mussen stated that since the passing of the Liverpool Sanitary Amendment Act of 1864 the city had spent more than £400,000 on the demolition of insanitary property, and over half a million in the acquisition of sites and the erection of dwellings under the Housing of the Working Classes Acts. The rental received from these dwellings was about £21,000 per annum. The corporation had obtained powers to close cellar dwellings after the year 1912, and in the meantime to pay reasonable compensation to owners who closed such dwellings. This, it was hoped, would rapidly reduce the number of cellar dwellings in the city. Was it too much to suggest that these beneficial provisions would soon be included in a general Act and be applied to the country at large? A Town Planning Bill chiefly for regulating the laying-out of estates to the suburbs had been promoted by the Liverpool Corporation, and had passed the Committee of the House of Commons. He thought this Bill would be more beneficial than the Government Bill on "town planning," under which nothing could be done without the sanction of the Local Government Board. A resolution was adopted urging the necessity for specifically naming sanitary inspectors in the Bill as officers charged with the enforcement of its provisions.

CLEANING BRICK BUILDINGS.

By A. B. Searle.

In these days of large factories and indifferent success in smoke consumption, the problem of cleaning the faces of brick and other buildings in our large cities is becoming increasingly important if the original designs of the architects are to be carried out and a proper colour scheme in our main streets is to be retained.

The rapidity with which a brick building becomes covered with dirt and soot depends on its situation and on the porosity of the bricks used in its construction, entirely non-porous bricks, such as those used for engineering purposes, and those covered with a glaze, being washed clean by the rain. Hence the harder and denser the bricks used the cleaner will be the face of the building.

As most bricks are somewhat porous, a periodical cleaning of the buildings becomes desirable, but the greatest care is required not to damage the material. Thus, in America, it has been the custom to scour dirty buildings with wire brushes (sometimes driven by small motors), but this is not to be recommended, as the wire removes the smooth face of the bricks and leaves exposed a still more porous surface, with the result that the building rapidly becomes dirty again. No method or material which in any way damages the natural face of the brick should ever be used in cleaning.

The "Acid" Process.

A very popular means of cleaning brick buildings in this country is by the use of hydrochloric acid, and provided the acid is not too strong this method may be quite satisfactory. It will generally be found that the ordinary commercial acid will stand the addition of 15 times its volume of water, and it should never be used without the addition of at least 12 times its volume of water. For many purposes, acetic acid is more satisfactory than hydrochloric acid, as it is equally effective in its action on the dirt, without having so corrosive an effect on the bricks. It is more expensive, but owing to its non-corrosive action buildings on which it is used remain clean longer than when the stronger "spirits of salt" is employed. It should be used somewhat stronger than the latter, about 8 times its volume of water only being added.

The amount of acid and water mixture required will vary somewhat with the care and skill with which it is applied, but will average about 4 sq. yds. per gallon of mixture, with ordinary care, and costing for acid about a farthing a square yard, with acetic acid, and half to one-third of this amount for common hydrochloric acid. As the cost of the acid is but a small cost of the whole of the cleaning, it does not always pay to use the cheaper acid, because, as already pointed out, the buildings, being corroded by its use, do not last clean so long as when the original surface of the brickwork remains undisturbed, or when acetic acid is used.

When acid is used to clean the face of a building, the latter should first be washed over with clean water to remove all the dirt which can be taken off by this means. The surface is next treated with the weak acid—a hard brush, but not one of metal, being used—and finally the building is washed over with clean water, to remove any material which has been loosened, but not actually removed by the acid. This final washing may, if desired, be carried out by means of a powerful jet of water, care being taken to work from the top of the building downwards, so as to prevent all accumulation of unsightly spots caused by the "creeping" of the dirt, which always occurs when the building is played on irregularly with a hose.

The Use of Soap.

In spite of the advantages and simplicity connected with the use of acid for cleaning buildings, there are many objections to this method, and other detergents are preferable because they have less action on the bricks themselves. Unfortunately, they are generally considered to be too expensive, though this idea is far from correct, when the total cost of cleaning throughout a considerable number of years is considered.

As soot is the chief cause of disfigurement of buildings in large cities and manufacturing towns, and as this material is not acted upon by any chemical that could be used for cleaning, other matters must be taken into consideration. Among these is the well-known fact that soot is always greasy, and therefore would be more easily removed from buildings by some agent which would destroy the grease, such as alkali or soap.

On this assumption, the use of soft soap has been tried with much success, especially when it has been dissolved in 36 to 40 times its weight of warm water (1lb. of soap in 4 gallons of water) and used whilst still warm. Apparently the most efficient cleaning is obtained by treating the building with clean water, then with the soap solution applied with a hard brush, and finally washing down with water just as was recommended above when acid is used.

Soap has little or no action on clean brickwork or stone, and its effect on soot and similar matters of a greasy nature is far more intense than that of any acid, so that when it is used, buildings of either red or buff bricks rapidly regain their original colour, unless the cleaning process has been so long delayed that nothing can ever remove the dirt from the bricks. Care must be taken to wash off thoroughly all the soap by means of a thorough playing with a hose or by the more expensive washing over with clean water, or discoloration will be produced. In actual cost, the use of soft soap in the manner described works out at practically the same as for acid.

It is not desirable to combine the two methods just given, as some contractors have found to their cost, for the acid decomposes the soap and produces oily compounds, which easily form spots of a disagreeable appearance. Hence, it is necessary to adopt *either* acid or soap, but not both.

In buildings where the dirt is more of a dusty than a sooty character, it will not usually be necessary to employ any special cleansing material, as a powerful spray of water—such as that from a fire-engine—will usually clean the building sufficiently, providing that the surface of the bricks is reasonably close and dense. Sand-faced bricks are particularly difficult to clean, on account of their roughness of surface, which enables the dirt-particles to lodge more easily than on the face of a vitrified or glazed brick.

In cleaning terra-cotta work, special care must be taken that the surface is

not destroyed, as much of the modern terra-cotta has a finished or dense face but an open or porous body, and if once the face is removed it will be almost impossible to keep the building clean.

In cleaning window-sills and other projecting stonework, care should be taken to use only so much water as will drop clear from the walls of the building, as otherwise unpleasant "smears" and "trickles" will be produced.

Above all, care should be taken by architects who wish their buildings to remain clean in spite of unfavourable surroundings, to use those bricks, terra-cotta, or other materials which have a slightly glossy and dense surface from which the dirt will be readily dislodged by showers of rain or by a simple water jet. If this point were more closely watched, many public and other important buildings would present a much more pleasing apearance than they do at present.

Scum Removal.

For buildings which are disfigured by a whitish encrustation, technically known as efflorescence or "scum," the use of very weak hydrochloric acid is almost essential, though even this does not always prove a complete remedy. The causes of "scum" are so numerous and complicated that it is difficult to provide any single means of removing this unsightly material.

Scum is chiefly caused by soluble salts in the bricks, which are dissolved when the latter become wet with rain, and as the water dries out it carries the salts to the surface of the bricks and there deposits them. If the scum were only thicker, it would be best to remove it by scraping the walls gently, taking care not to scratch the bricks, but this is not usually practicable, and the least harmful method is to brush the defective surface with a moderately hard dry brush, when the bricks are thoroughly dry. Should this not prove effectual after several times, the surface may be washed over with a little weak acid, and then with water, the disadvantage of this latter method being that it may cause the formation of a larger proportion of soluble salts (through the action of the acid on some of the constituents of the brick), and the remedy may thus prove to be worse than the disease. The same, in a lesser degree, is true of repeated scrubbing of the wall with a wet brush and water.

The expressed opinion of many brick manufacturers to the contrary notwithstanding, the greater part of the scum which disfigures so many buildings is really due to faulty material or to the use of impure water in manufacture, and only in very few instances is it due to the absorption of soluble salts from careless storage of the finished bricks. It is, of course, very unfortunate when a brickmaker cannot turn out goods free from scum or "whitewash," but, from the builder's and architect's standpoint this is not satisfactory, and provided that other makers are equally accessible is no reason why the less pleasing bricks should be used. The cleaning of scummed bricks will then be unnecessary.

CHANGE OF ADDRESS.—The Associated Portland Cement Manufacturers (1900), Ltd., have removed their chief offices to Portland House, Lloyd's Avenue, London, E.C. The telephone number will remain as at present (5690 Avenue).

CONTRACTORS AND REINFORCED CONCRETE.

The increasing amount of work which has been and is being executed in reinforced concrete has naturally attracted the attention of contractors, generally, to this method of construction. A number of firms who have had some experience of concrete work have taken up the exertion of reinforced concrete, and other firms who have been engaged for many years as ordinary builders and contractors have seen advantages in specialising in such work. Reinforced concrete requires expert knowledge in supervision and trained workmanship in execution, and the ordinary methods of conducting building operations do not apply to it. Not only practical experience, but engineering ability are required in the supervision and management as well as trained superintendents, foremen, and workmen. Being a somewhat new subject and one which is not well understood by the ordinary building construction student—certainly not by the ordinary foreman—reinforced concrete, as a method of construction, cannot be executed properly by the ordinary builder whose training and organisation has been derived from conducting building operations in the earlier and more traditional methods of building. It is, of course, possible that reinforced concrete will become so much an every-day method of construction as time goes on that a few years hence the whole of the building trade will understand it as well as it does brickwork or masonry construction. But at present there are no indications of this, and modern building operations are now so much more complex and require an amount of engineering knowledge that prevents craftsmen and foremen such as are employed to-day becoming proficient enough to undertake such responsibilities. In every direction work is becoming specialised. In the United States large structures are executed by numerous specialist firms, each doing separate portions who manage to work harmoniously with each other. In the last decade we have seen the steel frame structure introduced in this country, and there have been rapid changes in the methods of executing large building operations. The construction of the fireproof floors, which, for many years, have been increasingly adopted for buildings of any size, have been gradually given into the hands of specialist firms; heating, ventilation, lighting, steelwork, etc., are all now undertaken by specialists, and it seems to be the tendency for reinforced concrete to be dealt with in the same way. Architects and engineers have begun to recognise the absolute necessity for great care and adequate knowledge, in reinforced concrete construction, and they now generally insist upon the work being executed by experienced firms employing competent staffs of engineers and trained foremen. So much depends upon the reinforcements being in the proper position to ensure the work being of the strength designed, that the carelessness of the ordinary workman cannot even be tolerated. Firms who specialise in the construction of reinforced concrete have to keep hands in regular employment who are accustomed to working in this new method of construction, and, though the craftsmen are not paid so highly as in some other skilled trades, they are very different to the ordinary builder's labourer or the navvy. The execution of centering, too, cannot be done by the ordinary carpenter, for it is almost a craft in itself, intermediate between carpentry and joinery. A foreman must not only be thoroughly able to interpret the drawings accurately, but possess some elementary knowledge of reinforced concrete construction, and must exercise the closest supervision over the work, and have the ability to economise labour and material, for waste of which there are so many opportunities in dealing with this new method of construction. Then, finally, the control of the work must be in the hands of specialist engineers, experienced in reinforced concrete construction, competent to check the designs; they must be made completely responsible for the work, or there may be grave risk of collapse and danger to life and limb. A number of contractors who have undertaken the execution of reinforced concrete work have found to their cost that experience and expert knowledge is required, otherwise loss as well as inefficit workmanship and possible instability will result; in short, reinforced concrete work requires to be carried out by a specialist contracting organisation. Reinforced concrete is booming, but it is to be hoped that its progress will not be hampered by any examples of great catastrophes and numerous accidents such as have occurred in the United States as a consequence of the work being undertaken by contractors possessed of little or no knowledge of the subject. The truth must be told, contracting methods are rapidly and radically changing; the contractor of the future will need to conduct his business on very different lines from the builder and contractor of the last century and of the present decade. It seems to us probable that in the near future English contractors for large building works at any rate, will occupy very much the position of the American contractors, who are more financiers, controlling numerous specialist sub-contractors, and executing hardly any portion of the work themselves.

A large party of Warsaw merchants who arrived in London on Friday week, and left for the Continent last Thursday, are stated to have been largely interested in building and building materials, and to have "placed" in London a large number of orders, whilst enquiries were made that are expected to lead to a considerable expansion of business between England and Poland.

* * *

The rebuilding of Drury Lane Theatre after the fire is so nearly completed that the re-opening of the theatre is announced for to-morrow, September 17th. The new stage, which is said to have cost £20,000, will be 100ft. wide, 100ft. deep, and 100ft. high—nearly half as large again as the old structure. The Drury Lane floor has used up 10,000ft. of teak, specially imported from Burmah. The new roof is 20ft. higher than its predecessor, and is constructed of steel trusses 10ft. high and 90ft. long. A glass roof surmounting the "grid" avoids the necessity of artificial light for the day work. The old timber roof had stood for a century, and was as sound at the end as at the beginning. An improved electric lighting installation gives an illumination equal to 150,000 candle-power. Fly galleries, from which the scenery is worked, have a total length of 250ft., and are constructed of steel. The limelight galleries are nearly 200ft. long.

THE TRADE OUTLOOK—WINTERY.

That the building trade is suffering from the severest and most protracted fit of depression it has ever known is only too evident. The question is, are matters improving, or are we to reach even lower depths? Here, of course, there is ample room for divergency of opinion, and accordingly the optimist and the pessimist are expressing the opposing views appropriate and natural to their respective temperaments. A cheery optimist, writing in the "Daily Chronicle" of September 4th, has no hesitation in prophesying increased activity in the near future. Indeed, he already discerns an upward movement. "As one who knows the building trades," he writes, "I believe that the worst has been seen, and that things are on the mend." He then quotes the Board of Trade returns for August, as showing that in London there was an increase of 8 per cent. in skilled tradesmen employed, and of 11 per cent. in the number of labourers compared with a month ago, and that there is actually an increase of 14 per cent. in the number of labourers compared with a year ago. He derives further comfort from the fact that a number of local authorities throughout the country are increasingly adopting the advice Mr. John Burns gave them last November in his address to the Municipal Corporations Association, and pressing into the ordinarily slack period of winter large public works and buildings, the execution of which can be so arranged. Improved methods of transit, he points out, have also given the painters and house repairers a great deal of work. When lack of travel facilities confined people to certain areas, the landlords were in many cases indifferent to the claims of paint, whitewash, and repointing. Now that the electric tram and tube have given the people a wider range of choice of houses, the landlords, in order to retain their departing tenants, are cleaning, painting, and smartening up, and the effect is to give more employment than otherwise would have been available. Our optimist further writes that a great deal of reservoir, tramway, and engineering work, sanctioned in the past three years of Parliament, is reaching the stage at which, now that bricks and cement and iron and steel are cheap, it will be undertaken. All over the country, the method of adapting public work to seasonal decline of general and private trade will, he declares, so far as building is concerned, go a long way to tide the labourers in that trade over the winter.

Against this determined optimism we have, unfortunately, to set some very grim facts of the opposite character. The valuable reports that have been forwarded to us from the secretaries of master builders' associations in every part of the country contain many references to the state of trade in given districts, and the record of depression is, so far as we can gather, unrelieved by a single gleam of hopefulness with regard to the immediate future. Most towns seem to be overbuilt; and the high rate of interest on money—which for many months was only procurable at from five to seven per cent.—had no doubt the effect of postponing a great deal of speculative building, which, now that the bank-rate shows signs of remaining normal, may now be expected to recommence in those districts—if there remain any—where small buildings are still wanted.

In a previous issue it was shown that the brick and tile makers of Northamptonshire and elsewhere, as well as the slate quarriers, were exceedingly slack. It now appears that the manufacturers of bricks and tiles in Bridgewater are feeling very acutely the depression in the building trade throughout the country. There has not yet been a reduction in the wages of the many hundreds of men engaged in the various yards, but, stocks being very heavy, much short time is feared in the winter. The charges placed on manufacturers through the operation of the Employers Liability and other Acts tend continually to increase, while rates and taxes do not diminish. During the boom in the building trade a few years ago, brickyards were started all over the country, and these curtailed the area supplied by Bridgewater. The trade in best facing bricks to Dublin has fallen to a shadow, and the valuable trade in ridges to London has almost ceased. The outlook at present is very unpromising. In their endeavour to maintain sales and keep their men employed, manufacturers compete fiercely with each other, as well as with outside firms, for what business there is, with the result that the best businesses at present barely provide enough to pay wages and expenses, and leave nothing for profit, or for extension and replacement of plant. The building operations at Fishguard have absorbed large quantities of Bridgewater bricks at low prices, and it is hoped that the trade of London and other important centres may revive next year. It would be easy to multiply evidence of this kind, which, like our reports on the iron and steel and Portland cement trades, all points to the same uncomfortable conclusion, namely, that trade is about as bad as it could possibily be, and shows no very clear signs of immediate betterment.

The continued depression in the building trade and the false rumours of improvement, have been made the subject of special enquiries by a correspondent of the "Manchester Dispatch," who was told by Mr. Batchelor, secretary of the Operative Bricklayers' Society, that "The building trade was never in a worse plight, and there is no prospect of improvement during the winter," Mr. Stennett, London District secretary of the Carpenters' and Joiners' Union, was hardly more cheerful. Carpenters, he said, are in a very bad way. They are "suffering from two causes—improvement in labour-saving machinery, and overcrowding. The increase in steel construction has affected all branches of carpentry and joinery. Steel is displacing wood for skirting, joists, sash-frames, and so on. There is marble dadoing everywhere in place of oak, and I suppose soon, in the City at any rate, there will be no need for carpenters at all." Shop-fitting, Mr. Stennett, believed, had been temporarily suspended, in consequence of the Franco-British Exhibition. "Everyone in the West End has been so busy with customers blocking through the establishment all day, that there has been no time to think of fittings." When the Exhibition closes, there is likely to be a rush of work in shop-fitting. To the same correspondent, an unnamed member of the Federation of Building Trades' Employers expressed the opinion that "we must get back to very prosperous days in general trade before the speculative builder will be able to open operations again."

The unemployment consequent on this state of depression was the chief theme of Mr. Shackleton's presidential address at the Trade Union Congress at Nottingham; and in such centres as Birmingham, Coventry, Manchester, and, above all, at Glasgow, unemployment has become an exceedingly embarrassing problem. But though, for the moment, the outlook is decidedly wintery, it may be that the trade is about to realise the truth of the proverb that "When things are at their worst they are about to mend."

Matters of Opinion.

No. 1.—The Increased Employment of Specialist Contractors.

It is true that each age produces its own difficulties, and it is, therefore, equally certain that each age must also grapple with those difficulties, consider them, and, if possible, find a satisfactory solution of them. In such case, experience, having no knowledge of the circumstances, can necessarily be of small account. If, from time to time, we deal, under this heading, with difficulties and developments occurring in the building trades, it will be with the clear intention of elucidating and setting forth views and opinions of those most qualified to speak and obtaining a nucleus of opinion which may be generally helpful to the contractors and others.

In taking for the first of these topics the increasing employment of specialist contractors, we may say frankly that we have found it a subject on which contractors, whatever they may really feel upon the matter, are at present somewhat loath to speak. The three opinons that we give (we have received others but couched in too colourless terms to be of interest), are absolutely in agreement as to the unsatisfactory character of the present arrangements, which are, after all only the outcome of a policy of drift. Take, for instance, the views of a large contracting firm in the Midlands:—

"In reply to your enquiry *re* 'Increasing practice of Building Owners contracting out with Specialist Contractors,' we ourselves have no objection to this course being taken, providing the owners are prepared to undertake the entire responsibility. The arrangement, as at present, works very unsatisfactorily: the principal contractor having no control over the workman coming from the specialist, but to a very large extent is made responsible for their actions and for the satisfactory character of their work. Matters are also complicated by the Workmen's Compensation Act, and the question of 'Attendance,' on these specialists requires to be dealt with in a different form than that usually employed. It seems to us most unfair to ask a general contractor to value an item in the quantities of which he can form no adequate judgment. We are of opinion that the employment of these specialists by the building owners direct, has a very decided tendency to delay the completion of a building, and oftentimes the chief contractor is involved in considerable loss in consequence."

We may note from this opinion the suggested complications under the Workmen's Compensation Act, and, in point of fact, this very difficulty has arisen within the last fortnight, in London, as the re-

[*Photo: Topical.*

THE BLACKFRIARS BRIDGE WIDENING.

The illustration shows the rapid progress being made with the widening by the contractors, Sir William Arrol and Co.

sult of an accident to a workman in the employ of a specialist firm. Take another opinion, this time from a large contracting firm in London:—

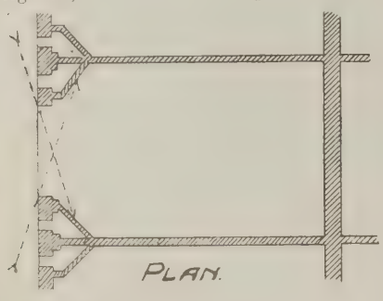
"The practice that obtains of including in the contract special works to be executed by other firms, is broadly, in our opinion, detrimental to the contractor. During the progress of the building he has to work with men who care little or nothing about the building in course of erection beyond their own particular work, and constant friction arises; also, as they know that, virtually, the order emanates from the architect, the contractor has great difficulty in controlling their work. Very often this is a fruitful source of delay, and cases have occured where the work of the specialist has been so bad that the contractor would not own it; but is not able to alter it. Yet it is done under his contract, and remains for all time as a specimen of his work.

"We can see no justification for this practice, except in the realm of sculpture, carving, and art-work. If trouble would only be taken at the outset to properly specify and detail these portions of the work, they could then be taken off and included in the quantities and priced in the usual way. What is the issue? The contractor becomes merely an agent, and in many cases has the whole responsibility, as if he were doing the work himself. On all hands specialists are springing up whose interest it is to work for architects to the detriment of the contractor, and the contractor is left with empty shops where such works used to be carried out."

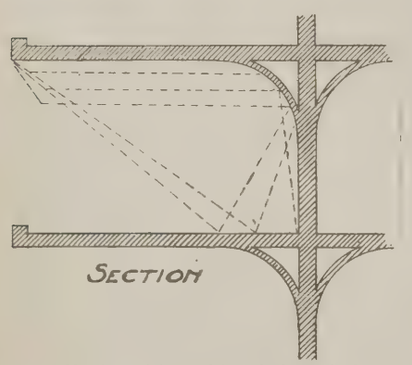
It might be worth mentioning here that even after a contract is signed alterations have been made and a specialist contractor introduced, to the detriment of the general contractor. A few weeks since, in talking to the representative of a big contracting firm, we learned that in a recent big contract of theirs, which included the execution of a certain extensive piece of work in one class of stone, a decision was come to after the commencement of the work to have that particular work executed in an entirely different material. Consequently, the whole thing was lopped out of the contract, and eventually placed in the hands of a specialist, and, needless to say, though the general contractors had not to supply either the materials or the labour, they lost the profit they would otherwise have made on the work. That such an alteration as this might have serious consequences is all too possible, for in estimating, a contractor may, and frequently does, cut his prices on one piece of work, relying on other parts to make his profit. Our third and last opinion, from another Birmingham firm, touches upon another undesirable feature:

"The question of the increasing practice of architects and building owners to include in quantities prime cost amounts for specialist contractors for the many and various requirements of a building is one which has engaged the anxious consideration of Builders' Associations and the National Federation. That it is a serious question for those who take the responsibility of a building contract will at once be apparent, such a contract always entailing in the last issue entire responsibility for the whole of the work embodied in the quantities. If a builder is to undertake such responsibility he should by all the laws of reason be given control of all the work and the workmen employed to execute it. Is this so under present conditions? Let us take a concrete case. In a recent contract taken in the Midlands of about £9,000, there were provisional sums amounting to £3,500.

"These provisions entailed the introduction of 23 specialist contractors. Among the items the most striking is a provision of £590 for joinery to be executed by a firm selected by the architect. The condition in the contract under which this and all other of the items were to be executed was as follows:—The contractor is to make good at his own expense all defects of whatsoever kind which appear within six months of certified completion, in particular should any joinery shrink, warp, wind, or twist more than one-eighth of an inch, the contractor will be required to renew same at his own expense. Comment is unnecessary. But another and, if possible, a still more serious aspect of such a contract is that in case of any accident to any of the employees of the twenty-three specialists the builder, as principal contractor, would be liable to be sued for damages under the Employers' Liability Act, although he had actually no control over them.



"It would seem nowadays that the term 'builder' is a misnomer: he is fast degenerating into a mere financial agent for the purpose of assuming the responsibilities of all and sundry whom an architect or proprietor may choose to specify, often for a very meagre return of profit. It is not to be wondered at that builders are beginning to ask themselves whether the remuneration is commensurable with the risk."



We may note here to what an extent specialist work is introduced into a contract, when nearly 40 per cent. of the work in a £9,000 contract is outside the general contractors' control. The logical and undesirable outcome of a contractor becoming a mere financial agent need not be laboured. But the prospect of such a development, which possibly has not yet gone very far, should be sufficient to induce contractors to take speedy steps to deal with the matter before it gets beyond control.

LIGHTING ROOMS.

New Methods of Construction.

Mons. Augustin Rey, architect to the "Fondation Rothschild" for the erection of working men's dwellings in Paris, has just made known a rather startling proposal for the modification of the planning and construction of rooms in order to secure efficient lighting by the sun's rays Mons. Rey points out that in growing towns, with their agglomerations of tall houses and comparatively narrow streets, it is almost impossible to ensure adequate natural lighting. His experiments were carried out in a moderate sized room, not overshadowed, having one large window, which did not, however, quite reach the floor or the ceiling. He found that the whole of the ceiling, the end wall, and over nine-tenths of the floor were badly lighted, while a small portion of the

front walls for either side of the window of the lateral walls and of the floor were in "obscurity." Translated into percentages, Mons. Rey's figures work out as follows:—44.93 per cent. of the surface was well lighted, 44.13 per cent. badly lighted, and 1.93 per cent. in "obscurity," i.e., semi-darkness. Therefore considerably over half of the surface of the room is deprived of the purifying action of the sun's rays and in cheap dwellings obscurity breeds dirt. The question is how to increase illuminations by both direct and reflected light. The means proposed are decidedly revolutionary yet quite simple. To begin with, Mons. Rey insists that the window should reach from floor to ceiling. His next suggestion is that the angles formed by the front wall, on either side of the window, and the lateral walls should be filled up with cupboards, the panels being placed at an angle. By this arrangement the front part of the room is effectively flooded with light, direct or reflected. Now comes the question of the back part of the room. If the room is almost square and not over large, all that is needed is to give the ceiling a gentle slope from window to inner wall. If the room is a deep one, then he cuts off the angle formed by the end wall and ceiling by means of a gentle concave curve. It is a parabolic curve, and Mons. Rey calls his new ceiling the "luminous ceiling." He finds that practically the whole surface of such a room is thoroughly lighted, only .30 per cent. being in "obscurity," as against 10.93 in "obscurity," and 44.13 badly lighted of the ordinary room. The cost of forming the "vaulted" luminous ceiling, the author declares, would not add a shilling a year to the rental of an average sized room. The question of appearance has some importance; the room is better lighted, so looks larger and more cheerful; the dissymmetry is not apparent, for the slope and curve are very gentle, and the eye is not incommoded thereby, less notice being taken of a curve than of an acute angle.

It is certainly worth while experimenting with the proposal, for unquestionably the thorough lighting of rooms, especially in towns, is of the utmost importance hygienically. The problem, too, is not without its economic aspect, as the system might well be applied to the planning of showrooms and workshops, at all events so far as regards the "luminous ceiling."

Market Reports.

Stone and Slate Trades.

The building stone trade has shared in the general depression with other building trades. The Bath stone and Portland districts have been slack; in the Sheffield, and Rowsley districts trade was fairly good. The Aberdeen granite trade has also been slack, and but for the American granite industry having tempted so many quarrymen away, unemployment here would have been serious. There has been a falling-off in the imports of foreign stone.

Some attention has been attracted to the slate trade by the three exhaustive articles that have appeared in "The Times," and if these do anything to improve the condition of the trade in Wales there will be much to be thankful for. The great preference of architects to-day for green slates has, of course, its part in making things slack in the principal Welsh slate districts, though a green Welsh slate from a small Carnarvonshire quarry is to be employed for the Bangor Normal College. Some indignation has been expressed that slates should have been imported from South Wales for the North Wales University buildings. The increase in concrete flat roofs on large buildings is also affecting the slate trade.

Brick and Tile Trade.

The brick trade has been good and bad in districts, but on the whole things have been very slack. Things were fairly good in Lancashire, at Chelmsford, North Wales, and Stourbridge. In the Durham districts and Ipswich, only moderate; Bedford was slack, and in the Midlands trade has been dull, especially so in the blue brick industry in South Staffordshire. The trade in the Peterborough district has been quite the worst known, and there is some talk of the Fletton manufacturers combining to regulate prices. The publication in the daily press of a statement that Fletton bricks could be bought at 8s. a thousand has led to some inquiries, but the general depression in the building trade has not tended to induce speculative purchases.

Timber Trade.

The soft wood timber trade continues quiet, with small importations, and still smaller demand. In spite of this latter fact, prices, though they have declined somewhat, remain fairly good, considering the general depression in the building trade. Outside London and the south ports business for the autumn has shown signs of improvement; there are numerous enquiries, and contracts have been made at from 5s. to 7s. 6d. per standard over the lowest spring average. This still leaves low prices, and with low freights and the cheapness of other building materials, there is every inducement for building operations to resume their normal volume. Manchester trade keeps steady, and prices firm; and the Glasgow trade is improving, but the North-East coast ports continue quiet.

Sweden and Canada have sent very small supplies, but the deficiency from the former has been made up by larger stocks from Russia and Finland. For prepared stuff from Sweden the demand has been a little better, and the prices are on the July average. The time is ripe for the large buyer on a cash basis, and a few are taking advantage of the cheap prices to make speculative purchases. Sellers are disposed to clear at unremunerative rates for the sake of ready money, and there are rumours of many quiet transactions at unreported figures.

Pitchpine imports have been restricted, but the demand is very small, and only fair prices have been maintained. For spruce there has been small demand, and prices have declined. Oregon pine rates fell, but recovered later, and are now little below the average.

For American walnut the demand is dull, and only large logs are asked for; the Italian walnut supply more than suffices for a restricted demand.

The teak and mahogany markets have been very slack; there is no demand for anything in teak but the best wood ("European quality"), and the cost of getting this on ship must inevitably keep up the prices. The mahogany trade has been very stagnant; the imports have been been very restricted, and have nearly equalled the consumption. Only the best timber has been in demand, and for this the prices ruled fairly good.

Wainscot prices are improving, principally owing to deficient supplies. Odessa oak has not been in demand, but the shipping having now finished for the season, the sellers are sure of their price.

The Iron and Steel Trades.

The iron and steel trades remain in a depressed condition, the only difference in the situation as compared with that of a few weeks ago being that sellers and buyers are now more generally satisfied than they were that prices have touched bottom. It is, however, never safe to prophesy, and those best acquainted with the conditions of the trade are always the most reluctant to express confident anticipations as to the future. We will content ourselves, therefore, with stating a few broad facts. It should always be borne in mind that the staple products of the principal British steelmakers are rails and shipbuilding materials. Shipbuilding is still in a state of coma, and there is no business in rails to speak of. Under such circumstances, British makers pay more serious attention to the girder trade, and for some time past British joists have competed very closely with the foreign article, especially in the case of wholesale orders for export. Where girders are sold subject to tests and inspection, the British article is frequently cheaper than the foreign. It is also well to re-

member that where a fair quantity of joists are required from stock, say 5/10 tons, or more, such can frequently be obtained from the stocks of several English makers as cheaply, or more cheaply, than foreign joists from stock merchants. The works' usual extra charge for stock delivery is 10s. per ton. The characteristic feature of the British steel trade at the present moment is a mania for price associations. Probably most of our readers are unaware that there is a regular association for fixing prices for joists for the home trade. In imitation of the German syndicate, the English makers have established a sliding scale according to quantity. The minimum price for 100-ton lots is £5 15s. per ton, carriage paid to the Thames, or other pricipal centre, with 2s. 6d. per ton extra for lots under 100 tons, and a further 5s. per ton extra for lots under 50 tons. Lots over 250 tons are subject to free competition.

The syndicated price for foreign joists remains at £5 4s. per ton f.o.b. Antwerp nominally, subject to rebates of 11s. and 13s. per ton for the South and North of England respectively. This price is for 1,000-ton lots, but wholesale merchants will sell any quantity at a shilling or two above the syndicate price. It is because of the multiplicity of steel combines that alterations in prices are so misleading, and cannot be taken as a correct index of the state of the market. The general impression of competent observers is that with America deeply depressed, and also disturbed by the Presidential elections. German mills nearly all working about half-time only, and our own shipbuilding trade in the depths of depression, there can be no recovery for some months to some.

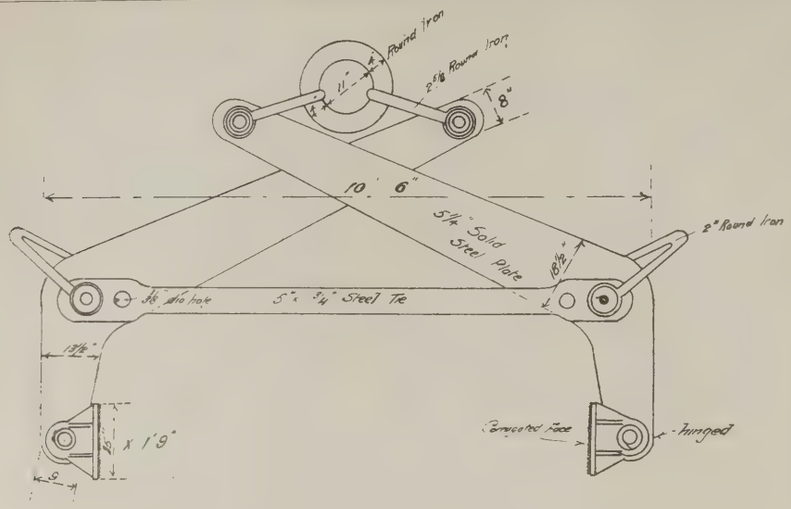
About the cheapest prices obtainable today for joists, from stock merchants, delivered free on van in London, are:—British, £6 10s. per ton; Continental £6 7s. 6d. per ton.

The Portland Cement Trade.

The Portland cement trade is marking time, with but little activity except in a few isolated markets where special conditions prevail. Prices have now reached a level that is lower, we believe, than ever before in the history of the industry, and below which it would seem impossible for them to drop, and we hear of makers preferring to reduce their output rather than accept some of the figures now current. There is no doubt that the present extremely low level of prices fully discounts even the substantial saving it is hoped will accrue from the new fuel contracts which will shortly be entered into. The building trades continue slack, with but little if any sign of improvement, and altogether the cement makers' lot at the present time can be far from a pleasant one. The only redeeming feature in the position is to be found in the fact that the importations of cement from the Continent into the United Kingdom continue to fall, and there seems to be every probability that the total for this year will fall below that of the year 1900. Since that year it will be remembered these importations have reached very nearly 300,000 tons, whereas it is expected that this year they will fall below 100,000 tons. One would have thought that so considerable a diminution of foreign competition would have at all events prevented any serious fall in home prices, and that it has not done so emphasises the unsatisfactory trading conditions which now exist. A feature of interest is the placing of the enormous Panama Canal contract for cement with one of the leading American firms. It was never seriously expected that the business would come to this side of the Atlantic, although several British firms tendered at very low figures.

CONTRACTOR'S PLANT.

A 150-ton Crane.



An illustration and description of the 150-ton crane which Messrs. Robert MacAlpine and Sons, of Glasgow and London, are using at the Methil Dock Works in Fifeshire will be of interest generally to contractors. This crane, which is being used for the raising of 50-ton blocks in connection with a new sea wall, belongs to Messrs. Swan, Hunter and Wigham Richardson, Limited, the Tyne shipbuilders, from whom Messrs. MacAlpine have hired it for their work.

The jib is hinged at the bottom, and is raised or lowered by means of a couple of rotating screws. For slewing, the barge on which the crane is built is moved by means of mooring ropes and anchor-chain, which are passed round steam-capstans on board. In addition to the heavy purchase, the crane has two

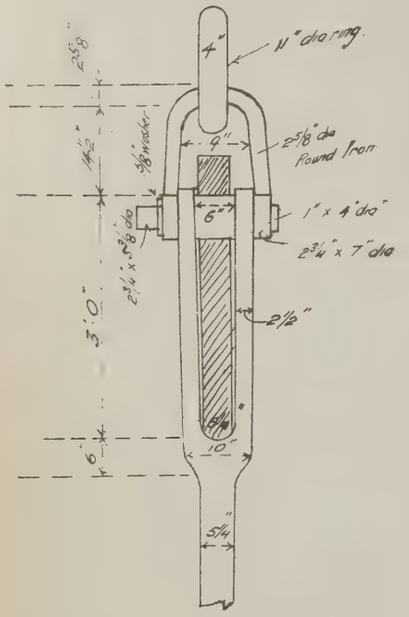


Photo: J. Brown.

150-TON TITAN CRANE IN USE AT THE METHIL DOCK WORKS.

— Elevation of Grips —

— Detail of Top Part. —

lighter purchases, which have proved invaluable in the case of block removal.

The grips used by the contractors are of interesting design, and are illustrated on this page. They were specially made of forged steel by Messrs. Stothert and Pitt, Bath, and are after the pattern used by builders in lifting fine dressed ashlar where shear-holes may not be made. The paws of the grips are grooved on the face, and hinged so as to bear fair on the block-face when the strain is on. The grips are hung by a chain from the heavy purchase-rope of the crane passing through a large ring connected to links fastened to the ends of the arms. A chain fastened to the shoulder links of the grips is linked to one of the light purchases of the crane. This rope takes the weight of the grips and is used for lowering them over the blocks and for lifting the grips after a block has been deposited in its new position. Owing to the grips being caught at the shoulders, they are kept spread by this means. Guide-ropes are led from shoulders of the grips to the barge.

When about to lift a block the grips are first squared by means of the guide-ropes and lowered over the block by the light purchase-rope from the crane. The heavy purchase-rope is then wound up, and the strain pulling the upper ends of the arms together presses the paws firmly against the sides of the block, which is then raised to a height sufficient to clear the neighbouring blocks. The crane then works itself round by means of its mooring-ropes, and gets into position for lowering the block to the new line. When the block is landed the grips are freed by the light purchase-rope from the shoulders, and a position taken up for gripping the next block.

LEADLESS GLAZED TILING AT THE NEW GOVERNMENT BUILDINGS.

More than 5,000 square yards of Carter's leadless glazed tiling have been recently supplied and fixed in the new Government buildings at Westminster, which were designed by the late Mr. John Brydon, and of which Sir Henry Tanner, I.S.O., F.R.I.B.A., is the superintending architect. The great recommendation of this class of tiles is that all risk to the workers in the glazing process is obviated. The question of lead-poisoning has been very much before the public of late years, and has long occupied the attention of the Home Office. Royal Commissioners have reported on it, and the legislation under Lord James of Hereford has reduced the risk to a minimum. Still, with the use of lead there still remains a certain amount of risk, but with the use of leadless glaze there is absolutely no risk at all. Hence the encouragement given by the Government to the manufacture of these tiles. There are one or two drawbacks, as, for example, a certain want of uniformity in tone of colour, which, while it commends itself to some tastes, is not so satisfactory to those who require even colouring. But to those who consider the health of the worker to be of more consequence than one special point in the article produced, which in other respects is quite equal in value, the leadless glazed tiles will certainly be more satisfactory. It may well be that even the slight drawback above mentioned will, in process of experiment, be overcome, but till then no doubt both methods of glazing will be in use.

New Companies.

A. Parry Fielder, Ltd., to acquire the business carried on by A. P. Fielder, and to carry on the business of architects, surveyors, financiers, concessionaires, merchants, builders, contractors, decorators, builders' merchants, etc. The first directors are to be appointed by the signatories. Registered August 18, by C. F. Smith, 1, Arundel Street, W.C. Capital: £10,000.

Bianco, Ltd., to carry on the business of merchants, importers and exporters of and workers in marble, stone, granite, limestone, slate, glass, earthenware, etc., and to adopt an agreement with Herman Lichtenstein. Registered August 22. Registered office, Victoria Wharf, Green Street, Bethnal Green, E. Capital: £5,000.

"Firmit" Flooring Co., Ltd., capital, £1,000; to carry on the business of flooring contractors, artists in Italian marble, terrazzo, Roman mosaic and Venetian glass, etc. Registered August 21. Registered office, 49, Deansgate, Manchester.

East Central Properties Co., Ltd., capital, £20,000; to acquire certain land and buildings in Stepney, and to carry on the business of builders, estate owners and managers, etc. The first directors are H. W. Johnson (managing director), and others to be appointed by the signatories. Registered August 27, by Bartlett and Gregory, 6, New Square, Lincoln's Inn, W.C.

Northwich Brick and Terra-Cotta Co., Ltd., capital, £1,000; to adopt an agreement with W. S. Moore, C. E. Williamson and Martha A. Barrow, and to carry on the business of brick, tile, terra-cotta, imitation stoneware and building material manufacturers, etc., as formerly carried on by the said vendors at Manchester Road, Northwich, as the Northwich Brick and Terra-Cotta Company. The first directors are W. S. Moore, C. E. Williamson, Martha A. Barrow, and J. Cawley. Registered August 22, by the Solicitors' Law Stationery Society, Ltd., 28-9, Chancery Lane, W.C.

Sydney and Thomas, Ltd., capital, £2,000; to adopt an agreement dated July 26, 1907, between J. S. Beale and H. Johnson, relating to the erection of buildings and the execution of works by the said H. Johnson on land at Southampton Row and Vernon Place, W.C., and the granting to the said H. Johnson of a lease of the said land and buildings, and to carry on the business of land and property owners and managers, builders, contractors, etc. The first directors are C. W. Bennett and T. E. Johnson. Registered August 22, by Charles Sawbridge and Son, 68, Aldermanbury, E.C.

Bankruptcies.

Thomas Robbins, jobbing builder and painter, 11, Bordesley Green Road, Birmingham. Liabilities estimated at £186 1s. 1d.; assets £64 10s. 1d.

Britton, Frederick, builder and contractor, Bedford Row, W.C. Liabilities £154,500. Assets consist chiefly of a book debt (£8,000), stated to be bad.

Jones, Ernest, Derwent House, Preesgweene, near Chirk, builder. Gross liabilities £1,168; expected to rank, £669. Assets, £430.

Javens, James Joseph, joiner and builder, Park Road, Carlton. Gross liabilities £877 1s. 5d.; £317 is expected to rank for dividend. The assets are nil.

Cooper, Charles, joiner and builder, Thorntondale. Gross liabilities £415 17s. 2d., of which £407 1s. 11d. is expected to rank for dividend, the assets being estimated at £76 18s. 6d.

Rowland, William Henry, painter and decorator, residing and carrying on business at Redhill Oil and Colour Stores, Coventry Road, Hay Mills. Liabilities expected to rank for dividend £67 19s. 3d. Assets estimated to produce £9 9s., the deficiency being £58 10s. 3d.

Barker, Joseph Wm. Lancelot, house furnisher and artistic decorator, 214, Western Road, Crookes, and 12, Haymarket, Sheffield. R.O., Sept. 5. Adj., same day.

Gillett, Wm. Frdk., timber merchant, 2, Styman Street, East Road, City Road, and 4, Hardwicke Villas, Bowes Park. R.O., Sept. 3. First meeting Bankruptcy Court, Sept. 16, at 12. P.E., same, Oct. 29, at 11.

Hart, Chas., builder, Laurel Cottage, Hemyock. R.O., Sept. 4. Adj., same day.

Hunt, Alf., builder (trading as A. Hunt), late 69, Marshall Road, Woodseats, Sheffield. First meeting, O.R.'s, Sheffield, Sept. 18, at 12. P.E., C.C., Sheffield, Oct. 8, at 2.

Jones, Jno. Clarke, joiner and builder, Woodville Cottage, Church Street, and Kingsway, Frodsham. R.O., Sept. 4. Adj., same day.

Marshall, Jno. Thornton, builder, Buckingham. First meeting, O.R.'s, Oxford, Sept. 16, at 12. P.E., Town Hall, Banbury, Oct. 27, at 10.

Moody and Lucas, builders, 5, Ravensbury Terrace, Earlsfield. R.O., Sept. 2. First meeting, 132, York Road, S.E., Sept. 18, at 12. P.E., C.C., Wandsworth, Oct. 15, at 12.

Richardson, Wm. Hy. and Wm. Slater Somerfield, plumbers and glaziers (trading as Richardson and Somerfield), Bearwood Hill Road, Burton-on-Trent. First meeting, Midland Hotel, Burton-on-Trent, Sept. 15. P.E., C.C., same, Oct. 14, at 12.

Sands, Thos., builder, 2, South Terrace, and Highfields, Broadoak, Heathfield. R.O., Sept. 2. First meeting, Crown Hotel, Hailsham, Sept. 17, at 11.30. P.E., County Hall, Lewes, Oct. 7, at 11.30. Adj. Sept. 2.

Current Market Rates of Materials in the Various Trades.

The quotations given in this list apply only to larger quantities purchased in London (the minimum quantity for which these prices are applicable being given where practicable). Retail purchasers must expect to pay a reasonable advance on wholesale rates, as well as carriage. The trade discounts for each item have not been considered, as these would be affected by the quantity of the goods purchased. The endeavour is made to give fair average prices, which would in many cases be affected by the quality of the materials required.

BRICKLAYER.

The current rates for stocks, Flettons, and other common building bricks, and for local facings are not given, as local considerations obviously affect their prices, and readers who may make use of the information given in these columns can readily obtain quotations for themselves.

		Current rates.	Rates for similar materials on Aug. 1.

Buildings in Progress and Completed.

Glasgow. — The Clyde Navigation Trustees last week formally inspected the new harbour works and extensions. These works include basins and quays at Yorkhill, now being executed by Messrs. Robert McAlpine and Sons, commenced in 1907, and now finished with the exception of about 174 lineal feet of quay wall and 280 lineal feet of superstructure. The contract embraces walls on monolith foundations, ordinary quay walls, timber wharfing, and reinforced concrete wharfing.

Portsmouth.—A new municipal college, to be run on the lines of a University College, has been erected on a site in close proximity to the Town Hall at a cost of £110,000. The departments into which the work is at present divided are as follows:—(1) Chemistry, metallurgy, and natural science; (2) mathematics, physics, and electrical engineering; (3) mechanical and civil engineering; (4) arts and commerce; (5) school of art; (6) day training college; and (7) pupil teacher centre. From the spacious entrance hall, ascending and descending, runs an imposing staircase, from which on each floor corridors branch out right and left to the various rooms on each side. The basement is mainly devoted to the engine-rooms, workshops, steam and electrical laboratories. The ground floor is devoted principally to the offices and a few class-rooms, together with the first of six lecture theatres. On the first floor is a suite of rooms for the mathematics, physical, and electrical engineering department, fitted with the requisite apparatus for preparing the students for the various examinations. Here, too, are the class-rooms for the day training college. There is, besides, a large examination hall, extending through two floors. On the second floor is a suite of rooms for the study of chemistry. There is also a suite of drawing offices for civil and mechanical engineering. The third floor, the topmost of the building, is exclusively devoted to theoretical and applied art. The architect is Mr. G. E. Smith, of Southsea, and the builders are Messrs. Armitage and Hodgson, of Leeds.

Messrs. Stacey and Co., have, among recent orders, despatched two of their patent winches to facilitate the execution of a large building contract at Entent, Singapore. These winches have also been selected for use in the construction of the new schools at Duke Street, Aldgate; new schools at Llandudno; fireproof floors at Hoare's Brewery, Smithfield, by Messrs. Stuart's Granolithic Co., making the fifth machine ordered by this firm, and the Western Valley Sewers, Newport, Mon.

We would draw the attention of our readers to the special offer held out to them by The Marshall Co., Office Equipment Specialists, 163, Mansion House Chambers, London, E.C., of which particulars will be found in our advertising columns. To secure the custom of our readers, the Marshall Co. are prepared to give 25 per cent. off their regular prices, being prepared to lose money on the first order, in the certainty that their wares will ensure permanent custom.

ROBERT ADAMS' NEW INVENTION.

IMPORTANT TO ARCHITECTS & BUILDERS.

REVOLUTION in Silent Door Spring Hinges.
A New and Wonderful Floor Spring for Double and Single Action Doors.
Absolutely the Shallowest, Most Perfect, Powerful and Efficient Spring ever invented.
Half the size, Thrice the Value and Durability of others.
Its unique Sealed Check Chamber is Impervious to Water, and an immunity against oil-stained floors.
It is calculated to increase the demand for double and single action Door Springs, even more than my original celebrated and now Universally used 1870 patent Spring and Adjustable Shoe.
Such a Shallow Box as referred to above has never before been known to be practicable. It has been specially designed for the shallowest floors, to suit the exigencies of modern construction.
Robert Adams' other Specialities include New Patterns in Fanlight and other Opening Gearing, Panic Bolts, Weather and Water Bars, &c., &c.
Particulars on application to the Patentee:

MONTHLY REPORT.

The half-yearly meetings were held at Birmingham, on July 28th and 29th, and have been already reported in our issue of August 5th, when reference was also made to the half-yearly report. Arising out of those meetings, the following business has been dealt with:—

The report and minutes of meeting have been printed, and sufficient quantities of the printed copies delivered to the secretaries of the county federations to furnish each of their members.

National Form of Contract.

A circular has been addressed to the local Associations through the county federations, enclosing copies of the three important resolutions passed by the general meeting for the purpose of further extending the use of the National Form of Contract, calling attention to them, and asking for information bearing on the subject to be returned on or before September 30th, for the information of the Administrative Committee, who will take this question up at their October meeting.

National Scheme of Conciliation.

A circular has likewise been sent out enclosing a copy of the resolution of the general meeting, and a copy of the minutes of the Special Sub-Committee of the National Board regarding the application of the Builders' Labourers for admission to the National Scheme of Conciliation, requesting that steps may be taken forthwith to submit both resolution and report to the respective county federations and report their opinion thereon on or before November 1st. The secretary of the Builders' Labourers (Mr Flanagan), and the secretary of the operatives' representatives on the National Board (Mr. Chandler) have been advised accordingly.

Official Journal of the Federation.

A circular announcing the formal appointment of the "Builders' Journal" as the official journal of the Federation, and giving particulars of resolutions and terms of appointment, together with a form of subscription, has been sent out to the secretaries of the county federations for transmission to each of their members.

Generally.

The usual correspondence and routine business arising out of the half-yearly meeting has been dealt with.

Organisation.

During August, the following places were visited by the secretary, and interviews secured with Builders or Association Secretaries—namely, Oxford, Reading, Folkestone, Dover, Canterbury, Ramsgate, Margate, and Bedford. Generally, associations at these places are either non-existent or in a suspended condition, except in the case of Bedford, where proposals are being made for joining the Federation. In the other cases arrangements have been made to correspond pending a suitable opportunity occurring for more active steps.

International Congress of Builders at Paris.

As previously advised, in the half-yearly report, the International Congress of Builders at Paris was to be held in September. A notification has just come to hand, however, to the effect that in consequence of the recent labour disturbances in the building trade in Paris and its environs it has been found necessary to postpone the Congress to November 16th to 19th next. A fresh programme will shortly be issued, and will be in due course communicated to the membership.

Conference of Secretaries.

The Annual Conference of Secretaries will be held in London on October 20th. On August 7th a preliminary circular was sent out to the federations notifying the above date, and inviting suggestions for the agenda or promises of papers by September 1st. So far, the response has not been equal to expectation, and this opportunity is taken to remind secretaries of the fact, and request them to forward their suggestions at once.

THE NORTHERN CENTRE OF THE NATIONAL FEDERATION.

COMPOSED OF

The Lancashire, Cheshire and North Wales Federation, The Yorkshire Federation, The Northern Counties Federation, and The Tyne and Blyth District Federation.

Secretary: JOHN TOMLISON, Cromwell Buildings, Blackfriars Street, Manchester.

MONTHLY REPORT.

Northern Centre Conciliation Board.

A special meeting of this Board was held at the Grand Central Hotel, Leeds, on Monday, September 7th, when an appeal from the Rochdale Local Board, re operative joiners' wages and working rules, was reconsidered. The appeal was previously before the Board on June 29th, when it was referred back with a view to the matter being settled locally. The local board have met on two or three occasions with a view to coming to a decision, but have not been successful. The decision of Monday's meeting is not to hand at the time of going to press.

THE LANCASHIRE, CHESHIRE AND NORTH WALES FEDERATION.

Secretary: JOHN TOMLISON, Cromwell Buildings, Blackfriars Street, Manchester.

MONTHLY REPORT.

The quarterly meeting of the Executive Council of this Federation is to be held in Lancaster on or about September 28th. It is announced that arrangements are being made for meetings of all the trade committees to take place at an early date to consider matters affecting the various trades.

LOCAL ASSOCIATIONS AFFILIATED TO THE LANCASHIRE, CHESHIRE, AND NORTH WALES FEDERATION.

MONTHLY REPORTS.

ALTRINCHAM, SALE & DISTRICT ASSOCIATION.
Secretary: W. Moody.

Notices were recently received from the Operative Bricklayers for alteration to the working rules, and counter notices were given. These were amicably arranged to the mutual satisfaction of the masters and the operatives. Notices have also been received from the Amalgamated Society of Carpenters and Joiners for alterations to the working rules, and for an increase of wages, and the questions are still in abeyance. The number of members to date is 140.

BARROW-IN-FURNESS ASSOCIATION.
Secretary: J. Baker.

The building trade here is suffering in sympathy with the general depression; and the stop-works, without any immediate prospect of the renewal of operations, added to the fact that the shipbuilding trade is very quiet, has curtailed the general building enterprise of the town. The number of members to date is 33.

BLACKPOOL ASSOCIATION.
Secretary: W. A. Clarke.

The Blackpool Master Builders' Federation has a membership of 73, which includes practically all the builders of Blackpool. During the holiday season but few meetings are held, as there is then naturally a difficulty in getting members to

attend; consequently there is for the moment but little business to report. A serious blow has fallen upon one of our members. His men were removing a scaffold on a building, when a short putlock slipped and struck a joiner who was working below. The man, although able to walk home, died the next day. The peculiarity of the position is this: Our member A is held to be responsible for the fatal accident to the man working for another member B, and third party insurance not having been effected B's insurance company claim the whole of the amount of compensation (£273) from A. The secretary mentions this because he finds that in this district very few take up a third-party policy.

BOLTON AND FARNWORTH ASSOCIATION.
Secretary: J. R. Vose, F.C.I.S.

The number of members of our association to date is 115. During the past eighteen months, since the adoption of the inter-trading rule, our membership has greatly increased.

We have at present a plumbers' strike taking place for an increase of ½d. per hour, making 9½d. The employers have opposed the alteration, desiring certain other alterations in the working rules, which were of a restrictive character. At the present there seems little hope of an immediate settlement. It has been decided that the support of the general association shall be given to the master plumbers in resisting the application.

Sectional meetings of the association have been held during the past month to consider the Federation Circular with respect to the desirability of taking uniform action to abolish restrictive trade rules, and to secure more uniformity in the hours of labour, etc. In the main, the principles of the circular have been adopted.

BURY AND DISTRICT ASSOCIATION.
Secretary: R. Hall.

Some months ago, the Bury Corporation took up the question of the housing of the working classes. The supporters of municipal housing urged that there was a shortage of cottages, and because, so it was alleged, the builders in the town declined to build.

The Corporation approached the agent to the Lord of the Manor, asking that the corporation should be put upon preferential terms as far as land was concerned, and even suggested to the said agent that he should insert a clause in the leases granted to the local builders and others, forbidding them to increase the price of ground rents when selling property.

The master builders took the matter up, and appointed a small but influential committee to go into the question of housing, and to meet the agent of the Derby estates, and if possible get him to grant concessions to the builders. The committee were also to point out to him the hardship it would be to the builders and others who had taken land and built upon it, if he granted the corporation conditions such as he would not grant to anyone else.

The committee have held several meetings, and have met the agent and visited several blocks of cottage property in Bury and Bolton, with the result that the builders are placed upon the same footing as the Corporation. The agent refuses to insert the clause suggested by the Corporation, with respect to increasing ground rents, because, as the builders' committee showed, in almost every case this over-riding ground rent is all the builder gets out of his building.

The committee have also been successful in getting removed certain restrictions with respect to the building of cottages. Altogether they are to be congratulated upon the success of their mission.

During the last two months three meetings have been held between the Operative Stone Masons' Society and the master masons respecting worked stone. The operatives complain that contractors from other towns, "where the standard rate of wages is less than in Bury," obtain work in Bury and bring their worked stone into the town. This is a vexed question, and the secretary of this association would like an expression of opinion from other towns that are under the same conditions—that is, those towns where there is an agreement with the operatives as to the "worked stone rule."

The number of members up to date is 96.

LEIGH AND DISTRICT ASSOCIATION.
Secretary: S. Wigham.

The report from Leigh this month is of a purely holiday character. On Saturday, August 1st, a dozen members of the Leigh Association invited a dozen members of the Bolton Association to a game of bowls.

The Leigh and District Master Builders' Association had their annual picnic on Thursday, August 6th, to Castleton, in Derbyshire, thirty-one members and wives assembling. After breakfasting at the Thatched House Hotel, they left in coaches for Castleton, driving via Mosear, Lady Bower, Yorkshire Bridge, and Ashopton, arriving soon after 2 o'clock. Among the places visited were The Castle of the Peverils (familiar to the readers of Scott's "Peveril of the Peak"), the extraordinary caverns of the Peak, the Speedwell and Blue John mines, and the chasm known as the Devil's Hole. The return journey was made via Hope, Bamford, Hathersage, Fox House, Dore Moor, and Eccleshall, the party arriving at the Thatched House Hotel, Sheffield, for dinner at 6.30. The secretary was complimented on the excellent arrangements made.

LIVERPOOL ASSOCIATION.
Secretary: Bertram B. Moss, F.C.R.A.

Meetings are to be held shortly of the Emergency Committee, and the Masons' Committee. The annual meeting, and the meeting of the Conciliation Board, are also about to take place.

It has come to the notice of the association recently that the War Office are departing from the usual custom in this part of the country, and are now inviting tenders for a job without supplying quantities. The association are approaching the War Office upon the subject, and have also asked the Lancashire and Cheshire Federation to take the matter up.

The Operative Masons, who have recently entered into a new agreement with this Association, doing away entirely with the breakfast half-hour, made application to have the amended leaving-off time on Saturday—namely, 12.30— altered to the original time, 12 o'clock. This matter will receive the attention of the Masons' Committee.

The Liverpool Corporation, through the City Engineer's Department, recently invited tenders for a small job without supplying quantities, and on application being made by the association for quantities to be supplied, the City Engineer readily agreed.

The number of members to date is 425.

LLANDUDNO AND DISTRICT ASSOCIATION.
Secretary: E. P. Morris, Accountant.

Owing to the summer season, no meetings have been held recently, but they will be renewed this month, when matters of interest to local builders will be taken in hand. During the vacation, an excursion was made to Port Sunlight, to inspect the works and village of Lever Bros.

MANCHESTER & SALFORD GENERAL ASSOCTN.
Secretary: John Tomlison.

The re-organisation of the Associations in this district by the formation of one general association for the trade, in preference to the several separate sub-trade societies, is at present taking place, and already the Master Builders' Association have thrown in their lot with the general society, and passed the formal resolution winding up their separate association. It is hoped that the other societies will do likewise at an early date.

The number of members to date is 213.

OLDHAM AND DISTRICT ASSOCIATION.
Secretaries: Cowper and Dean, Accountants.

During the period dealt with in the last half-yearly report notices for alteration of rules were received by this association from the Operative Joiners, Stonemasons, and Painters. The joiners' case came before the Northern Centre Conciliation Board, to whom the matter was referred, and resulted in an award practically in favour of the employers. The painters have been on strike, but an agreement was arrived at to refer the dispute to a Board of Trade arbitrator, who gave an award practically in favour of the employers. The operative stonemasons eventually withdrew their notices.

The inter-trading rule has now become more thoroughly appreciated, and complaints as to any breach thereof are less numerous. This is accounted for by the fact that the rule has had the desired object of increasing the membership of the association.

The number of members to date is 180.

RADCLIFFE, WHITEFIELD, PRESTWICH AND DISTRICT ASSOCIATION.
Secretary: W. Lomax.

This association has recently had a difficulty with the operative painters. There are two branches of the operatives' society in the area of the association, one in Radcliff, and one in Prestwich. The Prestwich branch gave the association six months' notice for an increase of wages from 8⅝d. to 9d. per hour, which notice terminated on June 1st. Although several conferences were held, no decision has been arrived at. A few of the employers (not members of the association), together with the operatives, asked the Board of Trade to send an arbitrator. The Board of Trade sent one, and he has given an award granting the men the 9d. per hour, and several alterations in the rules. The employers connected with the association, however, are not bound by this decision, and up to the present they have been able to get all the men they require at the old rate and rules.

The association gives each year a prize to the best student in Building Construction at the local technical school, and the president gives a further prize to the student having the best home-work papers. At the meeting held on September 2nd, two members of the association were appointed to decide who were the winners of the prizes. The giving of these prizes has greatly increased the interest taken in the Building Construction classes by the apprentices, most of whom are employed by the members of this association.

ROCHDALE AND DISTRICT ASSOCIATION.
Secretary: H. Oldham.

The operative carpenters and joiners of this district are asking for an increase of one penny per hour, and the employers gave notice for a revision of the whole of the rules. The matter was brought before a special sub-committee and the local Conciliation Board, but no settlement was arrived at. The dispute was then referred to the Northern Conciliation Board, at their meeting which was held in Leeds on June 29th last. Their decision was: "That the employers and operatives meet again and try to come to some amicable settlement." Failing this, the dispute would have to come before the Northern Centre again. The meeting between employers and operatives took place, but matters were not improved, the result being that delegates will attend the meeting of Northern Centre Board at Leeds on September 14th.

The death took place, on August 24th, of Mr. James Whitworth, of the firm of Messrs. Brook and Whitworth, painters and decorators, Milkstone Road. The firm are members of our association. The interment took place on August 27th, our association sending Messrs. R. Howarth (president), T. Wilkinson, F. Nicholl, and H. Oldham (secretary), as representatives.

The number of members to date is 60.

WARRINGTON AND DISTRICT ASSOCIATION.
Secretary: Bertram B. Moss.

This Association has recently been approached by the operative plasterers to amend two of their rules, in regard to the boundary rule and the country job rule. A conference has taken place between the employers and operatives, with the result that the employers have not been able to see their way to agree to any alteration. The alteration required by the operatives to the boundary rule is a very important one, namely, that they wanted all men to be taken on at the shop, and walking time to be paid in all cases.

This association held a monthly meeting on Wednesday, September 9th, but there is nothing of importance to report.

The number of members to date is 63.

WIGAN AND DISTRICT ASSOCIATION.
Secretary: R. Hollows.

The number of members of this association to date is 105. The rules of the Operative Bricklayers' Society were recently re-drafted, and the following concessions were granted by them: 1.—Breakfast half-hour in winter months done away with: men start with breakfast got. 2.—Starting places increased to 1½ miles from centre of town. 3.—Any job 3½ miles from centre of town is to be considered a country job. Any society men may be taken on at the job. No change in the rate of wages was given, though demanded by the operatives. The Operative Slaters' Society were recently granted an increase of ½d. per hour, to 9d. The summer months were reduced by a fortnight, and some variations in the hours in the winter months have been made.

There is nothing to report from the following associations, affiliated to the Lancashire, Cheshire and North Wales Federation:—Ashton-under-Lyne, Birkenhead and Wirrall, Burnley and District, Chester and District, Crewe and District, Darwen, Heywood, Lancaster and District, Longridge and District, Macclesfield and District, Middleton and District, Preston, Radcliffe, Rossendale and District, Whitefield, Prestwich and District, Southport and District, St. Anne's-on-Sea and District, St. Helen's, Stockport, and Wallasey.

THE YORKSHIRE FEDERATION

Secretary: J. DAVIDSON, 14, Park Road, Leeds.

MONTHLY REPORT.

The monthly meeting of the Executive Council was held at the Town Hall, Garrison Street, Bridlington, on Friday, August 21st. Mr. J. Biggin (president) occupied the chair, and was supported by 29 delegates from the affiliated associations. Alderman Sawdon, Mayor of Bridlington, was present, and stated that it was a privilege and pleasure to give the Federation a hearty welcome to the town. He gave most interesting statistics of the development of the town during the past few years. On the motion of the president, seconded by Mr. A. W. Sinclair, a hearty vote of thanks was accorded to the Mayor for his reception, and to the Corporation for granting the use of the Town Hall for the Federation meeting.

The treasurer reported receipt of subscriptions amounting to £15 18s., and reminded members that nine months of the financial year had expired. He made an earnest appeal to all associations to use every means to pay outstanding subscriptions before next meeting, and to co-operate loyally in maintaining the income and efficiency of the Federation.

On the motion of Mr. A. J. Forsdike, seconded by Councillor J. Dawson, the accounts amounting to £68 7s. 8d., which had been examined and certified as correct by the Finance Committee, were approved and cheques ordered to be drawn in payment thereof.

The president reported that the Home Office had expressed their willingness to see representatives of the Federation with respect to the furnishing of returns under Section 12 of the Workmen's Compensation Act, 1906. He and the secretary had thoroughly discussed the matter with an Under-Secretary, who expressed his desire that returns should be furnished relating to compensation paid for accidents arising on permanent premises which came under the classification of factories. It was pointed out that these only covered about five per cent. of accidents,

and that if the returns of the insurance companies included all accidents reported to them, the statistics would be entirely misleading, and might be used to the serious prejudice of building trade employers. The Under-Secretary thereupon promised that the Federation would be given an opportunity, if they so desired, of making observations to the Home Office when the first statistics are available. The Federation recommended members who are insured either under the Federation scheme or through an insurance company, if they are requested by the Home Office to furnish returns, to fill up a form giving the name of the company with whom they are insured, as the return will be made by such company on their behalf.

It was reported that at the Northern Centre meeting a resolution was passed that, as the Centre Federations were at the present time revising their rules, they should consider the desirability of making them uniform as far as possible, and the Federation secretaries had been requested to confer together with this object in view.

It was reported that at the half-yearly meeting resolutions were passed requesting the Royal Institute of British Architects to unite with the Institute of Builders and the National Federation in a joint effort to extend the use of the National form of Contract to districts that have not already adopted the form. The Administrative Committee were also requested to consider the desirability of approaching other societies or institutes of architects with a view of inducing them to adopt the National Form of Contract, and also to approach the Government departments and the various Public Local Authorities with the same object in view. On the motion of Councillor Dawson, seconded by Mr. J. Smith, the Federation resolved to approach the West Riding County Council with a view to the recognition of the National Form of Contract, and urged the local associations to approach the local authorities in their respective districts in order to obtain the use by them of the said form.

It was reported that the National Association of Builders' Labourers had applied to be admitted as parties to the conciliation scheme, but that as the Association had not been parties to the original agreement, it was left with each Federation to consider the application and determine as to its acceptance or otherwise. It was resolved, on the motion of Councillor Dawson, seconded by Mr. Mears, to defer the consideration of the matter for the present.

It was stated that the Federation were reported to be £42 in arrears on June 30th, 1908, in respect to their allotted contributions to the National Reserve Fund. It was resolved, on the motion of Mr. A. W. Sinclair, seconded by Mr. E. Quibell, to request the National Secretary to favour the Federation with a return of the present position of the National Reserve Fund, and to consider the matter further at the next meeting.

It was reported that the National Federation had arranged for the Annual Conference of Secretaries to be held on Tuesday, October 20th. On the motion of Councillor Mallinson, seconded by Mr. Townsley, the Federation secretary was empowered to attend the conference, and the local associations were strongly recommended to make arrangements for the attendance of the local secretaries, in order that the Conference may be thoroughly representative. The secretary read the minutes of the Northern Centre, Lancashire, Cheshire, and North Wales and Northern Counties Federations.

Councillor Dawson, Messrs. H. Fallas, and A. J. Forsdike, referred to the visit to Belgium under the auspices of the Sheffield Association, and acknowledged in suitable terms the splendid manner in which they had been received, and the most generous way in which they had been entertained by the builders of Antwerp and Brussels. On the motion of Councillor Dawson, seconded by Mr. H. Fallas, the Federation unanimously resolved to tender to the presidents and members of the Antwerp and Brussels Associations an expression of their high appreciation of the exceptional privileges enjoyed.

A letter from the secretary of the Grimsby Association was read, stating that Friday, September 25th, was a convenient date to the local Association for the next meeting of the Federation; and on the motion of Councillor Dawson, seconded by Councillor Mallinson, the arrangements were confirmed.

The Council were afterwards entertained to tea by the president and members of the Bridlington Association, to whom a hearty vote of thanks was accorded for their generous hospitality.

LOCAL ASSOCIATIONS AFFILIATED TO THE YORKSHIRE FEDERATION.

MONTHLY REPORTS.

BARNOLDSWICK AND DISTRICT ASSOCIATION.

Secretary: J. C. Addyman.

The monthly meeting of this association was held at Earby on September 7th. The president occupied the chair, and there was a fair attendance of members. The president reported on his visit to Belgium with a party of Yorkshire builders, who had been accorded a splendid reception by the Belgian builders. The president also called the attention of new members (of whom sixteen had joined during the past two months), to the Federation's arrangement with Lloyd's, as to workmen's insurance.

A draft letter to architects as to delay in rejecting or accepting tenders, and advocating intimation of the result of the tenders being sent to all contractors successful or unsuccessful uniform use of National Form of Contract, prompt issue of certificates, and item for workmen's insurance to be placed in all quantities, was considered and accepted.

It was decided to purchase Lumley's "Public Health," seventh edition, for the use of members. The following subjects were discussed: Annual return of number of men and apprentices employed; purchase of crests for new members; special forms of estimate; adoption of "Builders' Journal" as the official organ of the Federation; collection of outstanding subscriptions; reduction of wages.

BARNSLEY ASSOCIATION.

Secretary: J. Denton.

The Barnsley Federation of Building Trade Employers held their monthly meeting on Wednesday, September 9th, at the King's Head Hotel. Councillor G. Haigh (president) was in the chair, and was supported by the following gentlemen: Messrs. Councillor W. G. England, J.P., T. Lindley, F. Goodyear, P. Dalby, Councillor G. Mellor, E. Broley, A. Brown, H. Ashworth, J. Smith, T. Potter, J. Clarke, H. Medley, C. D. Potter, and the hon. sec., Mr. J. Denton.

The minutes of the previous meeting were confirmed. Correspondence was read from the local Trades and Labour Council asking the Federation to receive a deputation with regard to union and non-union labour on Corporation and other contracts (public).

The general feeling among the members was that, as a matter of courtesy, the deputation ought to be received. After discussion by several members, it was resolved that the deputation attend the next monthly meeting. It was resolved that the hon. sec. (Mr. J. Denton) attend the proposed Conference of Secretaries in London in October. A very interesting report of last Yorkshire meeting was given by Mr. J. Smith, a vote of thanks being accorded to that gentleman for his services rendered in attending the Yorkshire meeting, on behalf of the usual delegates unavoidably absent. The general reduction of wages question was debated by several members, but the meeting unanimously resolved "That no benefit would be derived from a reduction of wages, and any such action could not be entertained." The report of the last meeting of the Local Conciliation Board was given by Mr. C. D. Potter, who reported that the local area had been fixed by a five-miles radius of Barnsley. The Builders' Labourers also applied for admittance on the Conciliation Board, but their application was deferred for another meeting. The Federation delegates on the Conciliation Board action was approved. Pithy, comprehensive, and interesting reports of their visit to Belgium in connection with the Sheffield Association tour were given by Messrs. E. Broley and Councillor W. G. England, J.P., votes of thanks being accorded to these gentlemen at the close.

The new High Grade School for Girls, Barnsley, is rapidly approaching completion, the west wing being ready for the slates. The roofs are to be covered with Westmorland green slates from the Buttermere quarries. The architects are Messrs. Buckland and Haywood-Farmer, of Birmingham, and the contractor is Councillor G. Mellor, of Barnsley.

The number of members to date is 50.

DEWSBURY ASSOCIATION.

Secretary: E. B. Warmsley.

Mr. Sam Coop, of Messrs. S. Coop and Son, contractors, Dewsbury, is the president of this association, of which the meetings are held every third Wednesday in the month. This month there is nothing of special interest to report. The number of members is now 38.

SHEFFIELD ASSOCIATION.

Secretary: T. Smith.

The monthly meeting of the Sheffield Association was held on August 10th. Mr. Thos. Eshelby (president) occupied the chair, and there was a large attendance of members. A request for a meeting of the Conciliation Board was received from the Operative Bricklayers' Society, in reference to alleged violation of working rules by a member of the association. The operatives alleged that the firm in question were requiring them to work a full week of 49½ hours before paying overtime, whereas the rules distinctly stated that there should be one uniform fixed time for starting and stopping, and any deviation therefrom should be paid for in accordance with the rules respecting overtime. The men also alleged that they were not allowed walking time for distance beyond 2½ miles from the Parish Church as stipulated by rules, and they further alleged that an illegal deduction of 2d. per week had been made to cover Workmen's Compensation insurance. In reply to those allegations the firm in question complained that the first complaint arose from a mutual agreement of the men, who wished to make up some time in consequence of a particularly rough week. They had, however, instructed the foreman that henceforth the men must work rigidly to the rules. With respect to walking time, the firm had replied to the operatives that there was no case, as local men were engaged on the job. The firm were not sending any men from Sheffield, and if any members of the operatives' union were there, they must have applied and been engaged on the job.

ROBERT HALL,

Building Surveyor,

52, Frederick Street, BURY.

With over 35 years practical experience of the Building Trade, and during the last 15 years a very varied experience in measuring up and adjusting contract and other accounts, is prepared to undertake and submit quotations for the following work:—

The Measuring-up and Adjustment of Accounts,
Collection and Settlement of Accounts,
Assistance given in Estimating,
Annual or other Periodical Stocktakings,
Private Enquiries and Arbitrations undertaken,
or any other special work incidental to that a Builder or Contractor.

Author of the following

= = USEFUL = =

BUILDERS' PUBLICATIONS

THE BUILDING TRADES' POCKET BOOK, *bound in leather, price* **2/6,** *post free.*

This Pocket Book contains (1) a large number of useful **Builders' Tables,** showing at a glance the price of almost every size of timber at per foot, per square, and per standard, a Wages Table for Workmen and Apprentices, a large number of useful Iron Tables and much other information daily required by Builders; (2) An **Alphabetical Index** for quick and easy reference to any special matter its user may have noted down; (3) A quantity of **Ruled Memo. Paper,** so arranged that when used it can be slipped out and a refill (price 3d.) can be substituted, thus making it practically a new memo. book. The cover contains pocket for stamps, notes, &c. The utility of this book wins the approbation of all who see it.

THE BUILDING TRADES' POCKET BOOK, *price* **1/-,** *post free.*

This is a cheaper form of Pocket Book, and contains the same tables, in addition to ruled memo. paper which, however, is a fixture in this book. A very popular book.

HALL'S SUPERFICIAL READY RECKONER, 1/-, *post free.*

This Ready Reckoner is handy in form, and gives at a glance the superficial contents of any size of deal, batten, board, &c., from 1 ft. by ½ in. to 50 ft. by 3 ft. It fills a "long-felt want."

THE BUILDERS' MATERIALS PRICE LIST, 6d., *post free.*

This Price List consists of a strong folding card upon which can be entered the prices of almost every article used by a builder, for handy reference when making out accounts, etc. Every builder requires one of these.

MEASURE BOOKS for Quantity Surveyors and Quantity Clerks, *price* **1/6,** *post free.*

This form of Measure Book has been used by the publisher for many years, and is now regularly supplied to many firms, who have approved its handiness and utility.

SPECIALLY PREPARED QUANTITY AND ABSTRACT PAPERS. *Prices and samples sent on application.*

These papers are regularly supplied by me to many firms, both in large and small quantities.

COMPILER OF THE . .

LANCASHIRE, CHESHIRE, AND NORTH WALES BUILDING TRADES' EMPLOYERS' FEDERATION YEAR BOOK, *price* **1/-,** *post free.*

All communications or orders for the above works to be addressed to—

ROBERT HALL,

Builders' Surveyor,

52, Frederick St., BURY.

The deduction for insurance had been discontinued. After discussion the secretary was instructed to write to the operatives to the effect that the firm in question were now complying with the rules, and that the matter was therefore automatically settled.

In handing to the president five applications for membership, the secretary remarked that it was now considerably more than twelve months since they had had a monthly meeting at which new members had not been elected.

A letter was read from the Secretary of the Builders' Merchants' Association, saying that they would arrange as early as possible for a deputation from the Master Builders' Association to meet them in reference to the arrangement of preferential terms between builders and builders' merchants.

A letter was read from the town clerk covering the following resolution which had been passed by the City Council: "That this committee recommend the Council to modify the necessary clauses with regard to retention money as at present inserted in building contracts of the Corporation, so as to provide that one-half of the retention money shall be paid to the contractor on the expiration of six months from the date of the issue of a certificate of the completion of the contract, and the remaining half on the expiration of a further period of six months." The resolution implies an important concession, and is the result of the deputation from the Association to the City Council, pointing out that the terms whereby a contractor was required to keep a job in repair for twelve months, and have meanwhile 10 per cent. of the contract price retained was most harsh and unnecessary.

Mr. Forsdike said that when the Cottage Exhibition was in its embryo stage, Mr. Biggin and he were appointed as representatives of the association, and a good deal of work fell to their share. As time went on, it became necessary for the committee to have a number of guarantors, and they of course fell in with the others. Mr. Biggin and himself became responsible for £15; and now that the accounts were made up, there was a deficit of 14s. 6d. in the £ they were called upon to pay. He (Mr. Forsdike) was one of the judges, and altogether attended more than forty meetings, while Mr. Biggin attended quite as many. It was thought that after thus devoting their time, it was unfair that, seeing that they represented the association, they should also suffer pecuniary loss, and it was suggested that this should be made good to them by the association. It was resolved that the Association refund to Messrs. Forsdike and Biggin the sums for which they were individually responsible.

The next item on the agenda was a description of the recent visit to Belgium, which is separately reported in another past of this issue. At a later stage of the meeting Mr. Forsdike (who is president of the club) presented to the Builders' Exchange Club a handsomely framed copy of a photograph of the party, taken at Brussels, for which he was accorded a hearty vote of thanks. A further framed copy of the party, taken in the Zoological Gardens at Antwerp, will be presented by the president of the association (Mr. Eshelby).

WAKEFIELD ASSOCIATION.
Secretary: J. Beaumont.

A meeting of the members of this association was held at the Strafford Arms Hotel, Wakefield, on September 3rd, Mr. Tom Lee, the president of the Association, in the chair.

The minutes of a meeting of representatives of the association, and of the Operative Carpenters and Joiners' Society, were read, Alderman Judge presiding, from which it appeared that working rules between the employers and the operative carpenters and joiners were finally approved, and a recommendation was made for the rules to come into operation on November 1st next. On the proposition of Alderman Judge, seconded by Mr. W. J. Atkinson, the rules were approved and adopted, and another resolution was passed on the motion of Mr. Atkinson, seconded by Mr. J. Pashley, that Alderman Judge, Mr. George Crook, and another member of the association, be authorised to sign the rules on behalf of the association. Directions are also given for the printing of the rules after they had been signed by the representatives of both parties.

A copy of a letter prepared by the Yorkshire Federation, and proposed to be sent to architects and surveyors (dealing with the questions of contractors' tenders, the National Form of Contract, architects' certificates, and the inclusion in quantities of an item for insurance against accidents, was considered, and Ald. Judge moved, and Mr. W. Sanderson seconded, a resolution that a letter on the lines suggested be sent to each of the local architects and surveyors.

Alderman Judge moved, and Mr. H. Fallas seconded, a resolution that the "Builders' Journal" be adopted as the official organ of the association, and that the association become a subscriber to the Journal, the subscription to be paid out of the funds of the Association.

The number of members to date is 30.

There is nothing to report from the following associations affiliated to the Yorkshire Federation: Bradford, Bridlington, Grimsby, Halifax, Harrogate, Huddersfield, Hull, Leeds, Malton (Norton), Morley, Scarborough, Shipley and District, York.

THE NORTHERN COUNTIES FEDERATION.

Secretary: W. H. HOPE, Post Office Chambers, 14, Norfolk Street, Sunderland.

MONTHLY REPORT.

At a meeting of the Executive Council held at Sunderland, on Tuesday, August 11th, at 4.15 p.m., there were present Messrs. S. Easton, R. Heslop, Newcastle-on-Tyne; Alex. Ross, J. G. Robertson, South Shields; J. Davison, R. Johnson, W. C. Creasor, Stockton; W. S. Davidson, Middlesbrough; W. B. Cooper, J. W. White, Sunderland. The minutes of the Executive Council held at Sunderland on May 28th, which had been printed and circulated, were read and signed as correct.

Arising out of the minutes, the secretary gave a report upon the insurance of the members of the local associations. It appeared that the South Shields Association had appointed a small subcommittee to go into the question, who were of opinion that insurance should be left an open question, the members being free to insure as they thought best. The secretary explained the action of the Special Committee in adopting the Federated Employers' Insurance Association, Ltd., as the official insurance company of the Federation. Mr. R. Heslop, as a member of the Insurance Committee, endorsed the secretary's remarks, as did also the chairman. Mr. A. Ross also spoke as a member of the special committee, and referred to the action of South Shields. After some further discussion, it was resolved:—"That the South Shields Association be asked to call a meeting at an early date, and that Mr. W. C. Creasor, the representative of the Federated Employers' Insurance Association, Ltd., be given an opportunity of putting before the members the terms offered by his company, and that the secretary also attend the meeting."

With regard to North Shields, in the absence of a representative of that association the secretary stated he had attended their meeting and given the members information, with the result that the North Shields Association had rescinded their resolution adopting the tariff company, and leaving the members at liberty to make their own arrangements.

The consideration of the wages of the operatives, which had been referred to the Executive Council from the quarterly meeting, was considered, along with the different rates of wages paid within the Federation area. The opinions of the local associations were received, and after some discussion, it was resolved, on the proposition of Mr. R. Heslop, supported by Mr. W. S. Davidson:—"That this Council recommend to the Federation that no action be taken with respect to the wages paid to the operatives at the present time."

The motion of which notice had been given by the Hartlepools Association with reference to the Federation or local associations taking up shares in the Federated Employers' Insurance Association, Ltd., was considered. It was explained that the qualification for a representative to hold a seat upon the Directorate would be the holding in his own right of shares to the nominal value of £1,000. As this Federation is not in a position to take up the requisite shares, it was resolved, on the proposition of Mr. J. G. Robertson, supported by Mr. W. B. Cooper:—"That the Federation not having funds at its disposal to take up shares, no action be taken in the matter."

The question of the amendment to rules 4, 12, and 13, which had been put forward by the Hartlepools Association, so as to allow for the appointment of a chairman of the Executive Council in addition to the offices of president and vice-president, was discussed. Mr. Creasor, in the absence of any representative from Hartlepool, gave that association's reasons for placing the matter forward. On the proposition of Mr. Easten, supported by Mr. White, it was resolved:—"That while the Council is in sympathy with the object, the matter must be allowed to stand over until a more tangible scheme be submitted."

The financial statement showed £113 14s. 4d. in hand on current account, in addition to the amount on deposit. Accounts amounting to £47 16s. 5d. were, on the proposition of Mr. Heslop, seconded by Mr. Ross, passed for payment.

The Annual Conference of Secretaries will be held in London on October 20th, and all the secretaries of the local associations affiliated with the National Federation are invited to attend. On the proposition of Mr. S. Easten, supported by Mr. Cooper, it was resolved:—"That this Council, appreciating the educational value of the Conference, recommends the local Associations to appoint their secretaries to attend this Conference."

The Bill to make provision for certain regulations connected with the building trades has now been published. It provides inter alia that all accidents in the case of building operations shall be reported to the District Council.

The minutes of the National Federation and Northern Centre were read. Arising out of the Northern Centre minutes was the consideration of the question of admitting the Labourers' Union to the National Conciliation scheme. After considerable discussion, it was decided, on the proposition of Mr. Heslop, supported by Mr. Ross, to recommend to the Federation:—"That it is undesirable that, until we have a more extended acquaintance with the working of the Conciliation Board, the Labourers' Union should be admitted."

WAKEFIELD'S PATENT ACETYLENE FLARE LIGHTS AND HAND LAMPS.

EACH Flare Light is fitted with patent adjustable burner giving any power up to 5,000 candles. In two sizes; 6-hr. and 12-hr. capacity. Can be easily carried when empty by two boys and when fully charged by two men.

The Hand Lamp gives a light of 100 c.p. for 10 hours with a charge of 3 lbs. of carbide. Weight fully charged, 18 lbs.

Used by 100 Railways and Principal Contractors.

Quarter ,,	0 15 0

A discount of 10 per cent. for 13 insertions.

Those Firms who are entitled to the benefits of the Intertrading Clauses with the Association of the National Federation are especially invited to send announcements for these columns.

A letter received from the National secretary covering resolutions which were passed at the half-yearly general meeting relative to the National Form of Contract was read, and, on the proposition of Mr. Easten, supported by Mr. White, it was resolved:—"That copies of the letter be obtained, and a copy forwarded to each local association for consideration."

LOCAL ASSOCIATIONS AFFILIATED TO THE NORTHERN COUNTIES FEDERATION.

MONTHLY REPORTS.

MIDDLESBROUGH ASSOCIATION.
Secretary: Walter Rigby.

A circular has been issued by the Streets Committee of Middlesbrough Corporation giving notice to builders, plumbers, and others concerned, that all trenches in public streets required to be made for the purpose of drains, gas, water or electric light services, will in future be opened and filled in by the Streets Department. In the past this work has been done by the builder or plumber. This association, in discussing the circular, felt that the new regulations would be a great inconvenience, not only from the probable delay in getting outside workmen on the job, but also, and especially from the contractors' point of view, from the difficulty in estimating for this kind of work in contracts, owing to very uncertain knowledge of the Corporation charges. The Streets Committee was approached by letter, and a deputation from the association waited upon them and stated the case from the builders' point of view. The interview was very satisfactory, and the probability is that the matter will be mutually arranged on the basis of a schedule of prices for varying depths, and for the different kinds of material, etc., and there is to be registration of persons qualified to open up streets.

This association is endeavouring to arrange for a pleasure-party visit to the Franco-British Exhibition, London, on Monday, September 21st, returning on Thursday evening, September 24th, and the practical co-operation of the local associations, Stockton and the Hartlepools, is warmly invited.

STOCKTON-ON-TEES ASSOCIATION.
Secretary: W. C. Creasor.

At a meeting held on September 7th, Mr. Jno. Davison, president, presiding, the secretary reported that the Operative Bricklayers had withdrawn their original notice for an alteration in the working rules as regards short time in winter. Our sub-committee had endeavoured to induce the Operative Bricklayers' Society to accept the short time in operation at Middlesbrough, as the two towns were now almost for all practical purposes one. The Operative Bricklayers' Society had refused this, and now sent in a notice that in the months of December and January work should cease at 4.30 p.m. instead of 4.45 p.m. After discussion, it was decided to accept this alteration, as it was a step in the direction of obtaining one set of rules for Stockton and Middlesbrough, an object that has been sought for some considerable time.

A report of the National meetings at Birmingham was presented by the chairman.

Our previous opinion in regard to seeking a reduction of wages at the present time was confirmed, viz., "That we do not consider a reduction of wages should be sought at present," and the secretary was directed to forward this to the N. C. Federation.

Arrangements were made to present to Alderman Atterby, J.P., on Thursday next, the gifts subscribed for by the Association and members on the occasion of his marriage.

The secretary was asked to attend the annual Conference of Secretaries in October.

Reports of Federation meetings were presented and approved.

The number of members to date is 55.

SUNDERLAND ASSOCIATION.
Secretary: W. H. Hope.

A general meeting of this association was held in the board-room, 14, Norfolk Street, Sunderland, on Thursday, August 20th, at eight p.m. The secretary read a letter received from the Northern Counties Federation of Building Trade Employers in reference to serving notice for a reduction of the wages of the operatives. The matter had been before the quarterly meeting of the Federation, and had been referred to the Executive Council, when the question was considered along with the different rates of wages paid within the Federation, and the opinions of the local associations received. After discussion it had been resolved:—"That the Council recommend to the Federation that no action be taken at present with respect to the wages paid to the operatives." On the proposition of Mr. J. W. White, supported by Mr. J. McMillan, it was resolved:—"That in view of the letter received from the Northern Counties Federation of Building Trade Employers, this association take no further action in the matter at present."

The secretary reported that although applications had been made for the return of forms sent out to the members for information in connection with the section of the Sunderland Corporation (1907) Act relating to the breaking-up of streets, etc., very few of the members had responded. As the matter is one of great importance to the members, it was resolved, on the proposition of Mr. R. J. Huntley, supported by Mr. Hudson, "that each member be asked to keep the necessary particulars for another three months, and return the forms with these particulars, and to forward at once any forms that they may have already completed."

A letter having been received from the operatives requesting the employers to give their consideration to the fixing of the south and west boundaries of the local conciliation board's jurisdiction, it was resolved, on the proposition of Mr. J. W. White, supported by Mr. J. T. Clark, "that the question is already dealt with by the working rules, the area being that to which the working rules apply."

The question of making representations to the local slaters, plasterers, plumbers, and labourers to join the local conciliation board was considered and on the proposition of Mr. J. W. White supported by Mr. Hudson, it was resolved:—"That the question be left in abeyance at present."

A letter received from the National secretary, with resolutions respecting the adoption of the National Form of Contract by local authorities and others, was read and received.

The question of tendering for the Durham County Council was discussed. The two important matters at issue are the principle of independent arbitration in the case of disputes, and that quantities should be the basis of the contract. Correspondence had taken place with the Council, who had made certain concessions, but on these two points no concession had been secured. An attempt by the Federation to arrange a meeting with the chairman of the Educational Buildings Sub-Committee had been made, but without success. On the proposition of Mr. J. White, supported by Mr. R. J. Huntley, it was resolved:—"That this association recommend to the Northern Counties Federation of Building Trade Employers that a meeting of members and non-members of the Federation who have tendered for work for the Durham County Council should be held with a view to going fully into those grievances."

The Conference of Secretaries is to be held in London on October 20, and it was resolved:—"That the secretary attend the Conference and that one guinea per diem be allowed as expenses."

LOCAL ASSOCIATIONS AFFILIATED TO THE TYNE AND BLYTH DISTRICT FEDERATION.

MONTHLY REPORTS.

NEWCASTLE AND TYNE DISTRICT ASSOC.
Secretary: Wilton A. Rycroft, Accountant.

The trade in this district is very bad at the present time, and, as far as can be ascertained, there is very little new work to look forward to. The local association has recently been engaged in considering a set of proposed new bye-laws with regard to new streets and buildings, which the City Corporation are framing. These bye-laws have previously been before the association, when certain alterations were considered necessary, and I am pleased to say that the Town Improvement and Streets Committee of the Corporation have taken notice of the representations made by this association, and considerably amended the proposed bye-laws. A new set of rules to govern the association has also been under consideration, and will shortly be submitted to a general meeting of the members for their approval.

There is nothing to report from the following associations affiliated to the Tyne and Blyth District Federation: Blyth, North Shields, South Shields.

MONTHLY REPORTS.

BURTON-ON-TRENT ASSOCIATION.
Secretary: A. W. Chamberlain.

In bringing to the notice of the members of this association the "Builders' Journal," the secretary takes this opportunity of reminding them of the great and obvious advantages of supporting the official organ of the Federation. Every member should do something—(1) by becoming a subscriber to the Journal; and (2) by reporting to the secretary for publication any matter of interest.

LEICESTER ASSOCIATION.
Secretary: S. A. Dove, F.C.R.A.

The inter-trading rule that has recently been adopted is becoming more appreciated. The rule is having the desired effect in an increase of members, more than forty new members having joined since last July.

We are about to adopt a new set of rules, and have decided to follow the lines of the model set prepared by the Federation; also a day-work price-list has been prepared, and is expected to be ready by the end of the year

The number of members to date is 109.

NORTHAMPTON ASSOCIATION.
Secretary: A. L. Airs.

This association was founded in 1876 by the leading local men in the building and allied trades, and has had a very successful career. We have a membership of thirty-five. During the past year we have had practically no dispute with the employees.

The trade in the district is still very quiet, and there seems no prospect of its improving for some little time, most of our builders being employed with work away.

NOTTINGHAM ASSOCIATION.
Secretary: W. J. Barton, F.C.I.S.

The building trade in this district is in a very bad state indeed, and there have not been many questions brought before the association for discussion recently.

The association has appointed a sub-committee to consider several matters of interest and importance to the trade—for example, the increasing number of p.c. items in quantities, ironmongers declining to allow discounts on goods which the builder has to fix and pay for, and other matters of a similar character.

The two principal works at present in hand in Nottingham are the New Albert Hall and the New Hippodrome, both being terra-cotta jobs. The contractor (Mr. F. Evans) for the Albert Hall is making very good progress with the work which consists of a large hall for concerts, public meetings, etc., capable of seating 2,500 persons. The amount of the contract is about £17,000. The architect is Mr. A. E. Lambert, of this city. The site was only cleared about April last, and the structure has already reached a considerable height, and the steelwork for gallery, etc., is in a very forward state. Messrs. J. Parkinson and Sons, Ltd., of Blackpool, Newcastle, are the contractors for the Hippodrome, and although the site was not cleared until March last, the first performance is fixed for September 28th. This is a smart piece of work, as the building is one of the largest of its class in the country, the width inside being no less than 85ft., whilst the stage is 40ft. in depth with a 42ft. opening. Seating accommodation is being provided for 2,500 persons, excluding the waiting-rooms, which are being provided for all classes of the audience. The architect is Mr. Bertie Crewe, of London.

WORCESTER ASSOCIATION.
Secretary: W. Phelps.

We have had no meeting of late. With wages fixed for a term of years, and a Conciliation Board appointed to deal with disputes, there has been no business for us to discuss.

Trade is dull with us, though the Triennial Festival has given an impetus to the painting and decorative work. We have now no building of any importance being erected, except a £2,000 job which Messrs. Stokes are doing, and which is now well in hand. The Malvern builders, too, are very quiet.

Secretary: T. COSTIGAN, 31 & 32, Bedford Street, Strand, London, W.C.

MONTHLY REPORT.

The council met on July 16th, at 31 and 32, Bedford Street, Strand, W.C.

The reports from the Office Premises and Organisation Committees were read and adopted.

It was decided to support the motion proposed to be made by the Earl of Wemyss in the House of Lords that certain members of that branch of the legislature should be invited to represent and speak on behalf of central societies for the advancement of trade, commerce, industry, law, science, and art.

A proposition was received from the London Building Industries Federation (Operatives) that working rule agreements be made with those trades with which no agreements now exist.

The Council expressed its willingness to receive and consider applications from the separate building trades as to the formulation of reasonable working rule agreements between them and the L.M.B.A.

Information was received that "The Builders' Journal" had been adopted by the National Federation of Building Trade Employers as its official organ, and the Council agreed to supply reports to the same.

It was decided not to hold any meetings during August unless deemed necessary by the president.

MONTHLY REPORT.

PORTSMOUTH ASSOCIATION.
Secretary: F. B. Roskell.

A large and important meeting of this association was recently held for the purpose of discussing the grievances raised by the speculative builders of this town. A meeting had previously been held by the speculative builders to protest against certain clauses in the local bye-laws (building), and it was decided to appeal to the Master Builders' Association for their co-operation and support in the matter. Mr. M. Coltherup (president of the Master Builders' Association) presided over the meeting, at which there was a large attendance. The various clauses to which objection had been raised were explained or pointed out by representatives of the speculative builders, and after a lengthy discussion a resolution was passed to the effect that, as the meeting considered certain amendments in the bye-laws were necessary, a joint committee should be formed to draw up a report to forward to the Chairman of the Roads and Works Committee, asking them to secure the amendments desired. It was decided that the joint Committee should consist of five members of the Master Builders' Association and five of the speculative builders' representatives.

MONTHLY REPORTS.

BATH ASSOCIATION.
Secretary: E. J. B. Mercer.

The Bath Master Builders' Association held their usual quarterly general meeting on August 29th, Councillor J. W. Knight, J.P., president, in the chair. Mr. F. B. Parsons, vice-president, and several past presidents, and others were present. The minutes of the last quarterly meeting having been read and adopted, the hon. treasurer presented his accounts for the late summer outing to Stratford-on-Avon and Warwick, which were adopted, and a cordial vote of thanks was passed to Mr. Ambrose for making the forward arrangements.

A letter was read from the operative painters complaining of a breach of the rules by a member of this association by refusing to pay extra for overtime. The secretary was instructed to write to the member in question for his explanation.

In compliance with a request from the National Federation the secretary was empowered to furnish to the newly adopted official organ of the Federation, namely, "The Builders' Journal," such information as may be desirable.

Although the present working rules between employers and operatives provide for arbitration and conciliation, it was thought advisable to form a Local Conciliation Board to act in conjunction with the West of England and South Wales centre, as occasion may arise, and the following members were elected (pending settlement of numbers by head quarters)—namely, Messrs. J. W. Knight, J.P., F. B. Parsons, S. Ambrose, F. J. Blackmore, F. C. Chancellor, H. Erwood, G. J. Long, and A. W. Wills, to act until the regular meeting in May next.

BRISTOL ASSOCIATION.
Secretary: A. J. Pitt.

Possibly in consequence of the depressed state of the building trade in the West, few matters of importance have come before the association for consideration during the past month. The ordinary monthly meeting was held on August 27, under the presidency of Mr. Frank N. Cowlin, when, amongst other matters, it was reported that action had been taken in respect to a call for tenders for an important contract in the neighbourhood, in which it was stated that the sum of one guinea, not returnable, must be deposited before quantities were supplied. It had been pointed out that the builder was put to considerable expense in the preparation of a tender of any considerable size, and also that if such practice became general it would place the builders to great disadvantage. It was suggested that the amount of deposit should be returnable on receipt of a bona fide tender, and this had been agreed to by the authorities.

Consideration was also given to the matter of Corporation contracts, arising out of a motion put at a recent meeting of the City Council to the effect:—"That in all Corporation contracts the following clause shall be inserted:—That the works shall not be assigned or sub-let as a whole to any contractor, nor any portion of the works to be sub-let without permission in writing from the architect (or engineer), and then only to responsible parties, approved by the architect (or engineer), and the fact of any sub-contractor being permitted by the architect (or engineer) to undertake portions of the work shall not relieve the contractor from the full and entire responsibility attaching to the contractor, including responsibility under the clause herein contained, with reference to the payment of wages and observance of the hours and conditions of labour, nor from active superintendence of the works, either personally or by qualified agent during their progress. Provided that if the contractor shall be required by the architect (or engineer) the Corporation, or the specification to employ any particular sub-contractor, he shall not be responsible for work done or materials supplied by such sub-contractor, nor shall he be responsible to see that the clause relating to the payment of wages and the observance of the hours and conditions of labour is carried out with reference to the persons or workmen employed by such sub-contractor, nor for anything arising out of such sub-contract. For the purposes of this clause, a sub-contractor shall be deemed to include any person who employs workmen in the preparation of materials to be used by the contractor in carrying out his contract."

The president referred to a communication which had been forwarded in the name of the association to each member of the City Council, pointing out that it was absolutely impossible for any builder to carry out conscientiously the last clause of this resolution, and suggesting as an alternative that if found necessary or desirable, the whole of the materials used in the execution of the work shall be obtained from firms to be approved by architect or engineer.

Arising out of this, the Bristol Trades Council had written asking the association to grant them an interview upon the question, and this had taken piace on Monday, August 17th, when the matter had been very fully discussed with a view to deciding upon a wording that should be satisfactory to all concerned. Nothing definite, however, had been arrived at at the interview.

It was felt that in view of a rather small attendance, no good purpose would be served by further discussing the matter at that meeting, and eventually it was decided to refer the consideration of this subject to a small sub-committee, with instructions to report to the ensuing meeting.

There is nothing to report from the following associations affiliated to the South-Western Federation: Bridgwater, Cheltenham, Exeter, Gloucester, Hereford, Stroud, Taunton.

THE SOUTH WALES FEDERATION.

Secretary; W H. BILLINGS, Salubrious Chambers, Swansea.

LOCAL ASSOCIATIONS AFFILIATED TO THE SOUTH WALES FEDERATION.

MONTHLY REPORT.

NEWPORT ASSOCIATION.
Secretary: R. Richards.

The president, Mr. A. W. Brownscombe, has been elected upon the Executive on the Centre Board of the South Wales Conciliation Board, and Councillor William Augustus Linton, of Newport, has been elected chairman of the County Federation Board. Mr. Linton and Councillor William Miles Blackburn, a member of the Board, and also of the Executive Council of the South Wales Building Trades Employers' Federation, and Mr. William Moore have also been elected as its Newport representatives on the Executive Board.

Just now there are amongst the members signs of revived interest in the Association work. This Association has been in existence well-nigh upon half a century, and its past and present members have done excellent work in brushing away trade abuses and customs. They have, to their credit, both on National and local Councils, the initiation of reforms and rules that have been adopted both by the National Federation and by sister Associations. The history of the National Federation of Great Britain, and that of the local Association, is closely identified with the name of the late John Linton, of Newport, who was president of this association from 1873 to 1900, and who brought to its councils much experience, wisdom and foresight.

The executive committee are about to revise a handbook giving a "Schedule of Day Work Prices," for the use of members only, and they are also about to issue a new handbook containing the rules of the Association.

Amongst the new rules recently adopted is one relative to "Tendering without Quantities."

A circular has been issued to members advising them to use the National Federation crest for their trade stationery, etc.

Special efforts are being made to increase the membership of this old-established Association.

Work generally has been quiet during the past few months. Several new works are drawing to completion, notably the new Savoy Hotel, High Street; the additions to the County Council Buildings, Pentonville; and Summerhill New School and Institute. Work is being pushed on by the Great Western Railway in connection with the tunnel approaches, and it is anticipated by next spring sufficient progress will have been made to enable the commencement of work on the tunnel itself, and no doubt tenders for that work will soon be invited by the company. The Corporation have just given two public works contracts to Mr. J. H. Williams, Newport, for new roads, etc.

PONTYPRIDD ASSOCIATION.
Secretary: A. W. Julian.

Arising out of the secretary's annual report, papers are to be read occasionally on matters pertaining to the building trade, organisation, etc. Mr. G. L. Morgan, one of our members, has promised the first, which will be on "The Law with Respect to Drainage and New Buildings," which we hope to hear at our October meeting.

There is nothing to report from the Swansea Association.

SCOTTISH BUILDING TRADES FEDERATION.

Secretary: JAMES CAMERON, Solicitor, 61, Lothian Road, Edinburgh.

MONTHLY REPORT.

The annual meeting of the Scottish Building Trades Federation is to be held in the Imperial Hotel, Stirling Street, Aberdeen, on Friday, September 18th. Several items of importance are down for consideration, principally regarding the proposed new scaffolding regulations, workmen's compensation insurance, and the appointment of the "Builders' Journal" as the sole official organ for Scotland.

As regards the scaffolding regulations, the draft prepared by the Departmental Committee has been carefully revised by a committee representative of building trade employers throughout Scotland, and a report thereon will be submitted to the meeting, and a decision come to as to how best to bring the proposed amendments directly under the notice of the Home Secretary.

Employers generally have felt the extra premiums for accident insurance since the passing of the Workmen's Compensation Act a very heavy burden, and negotiations are meantime in progress with Lloyds with a view to an arrangement being entered into whereby there would be collective insurance by the Scottish Builders. Some definite statement is expected to be made at the annual meeting on this subject.

The employers in the Scottish building and allied trades have no official organ for ventilating any question that may affect them. Now that the National Federation has entered into an arrangement with the "Builders' Journal" whereby that periodical is appointed sole official organ for the 'National," the Scottish Federation have taken the matter up. The various centres in the "Scottish" have been advised of all that has been done. Specimen copies of the paper have been sent to them for consideration, and it is expected that a decision will be come to at the annual meeting to appoint the same paper sole official journal for Scotland.

The reports to hand on the state of trade all over Scotland make very dull reading. Without exception, bad trade is prevalent everywhere with little or no sign of improvement.

Steps are about to be taken to better organise the Scottish Federation, and at the annual meeting Mr. Cameron, the secretary, will have some useful advice to throw out; and it is hoped that employers generally will back him up in an effort to better the organisation of the building trade. Glasgow should come in at this juncture. For several years the employers in Glasgow have stood aloof from the Federation, with which they were formerly connected. They are a power in themselves, and any scheme of organisation could not be complete without Glasgow taking a prominent part in it. "Let Federation Flourish" should be the motto of all good and true members of the building trades who have their trade interests at heart.

ASSOCIATION AFFILIATED TO THE SCOTTISH FEDERATION.

MONTHLY REPORT.

EDINBURGH, LEITH, AND DISTRICT BUILDING TRADES' ASSOCIATION.
Secretary: James Cameron, Solicitor.

After a good deal of careful consideration the Executive have authorised the secretary to issue copies of a circular anent the inter-trading rule to all those connected with the building trade in the Edinburgh and Leith district, who are not members of the association. The circular is as follows:—

In order to safeguard the interests of those engaged in the building and allied trades, the above Association recommends that the following rule be put into practice, viz.—"Members shall not give or take tenders for any work to or from any persons who are not members of this kindred Associations connected with the building trade, and shall not employ such persons to do work for them." With such a rule, the position of the association would be materially strengthened, and it would be able to bring about much needed reform in the building trade in several matters of vital importance, such as:—A uniform mode of measurement for the several works; an arbitration clause appointing a neutral arbiter under general conditions of contract; payment for work done within a reasonable time after completion; a uniform set of general conditions of contracts to be mutually agreed on between this and the Architects' Association; the exclusive employment of contractors connected with the local associations. Employers engaged in the building and allied trades who have not yet joined the association are invited to do so. The secretary's address is 61, Lothian-road, Edinburgh.

At the monthly meeting of the Executive, complaints were made by several members in the Association who were unsuccessful tenderers for a contract for one of the Corporation bodies, that their schedules had been refused them on their writing to request the return of same. Much time and labour had been spent on the pricing of the schedules which would have been of great benefit for reference in similar work. Moreover it is quite the usual practice for schedules of unsuccessful contractors to be returned when asked for. The matter has now been taken up by the association.

The state of trade in the Edinburgh district is very quiet indeed.

There is nothing to report from the following associations affiliated to the Scottish Federation: Aberdeen, Alloa, Dingwall, Dumfries, Dundee, Hawick, Inverness, Keith, Kilmarnock, Oban, Paisley, Perth; nor from the following Glasgow associations: Master Brick-Builders' Association, Master Masons' Association, Master Wrights' Association, Master Plumbers' Association

ASSOCIATIONS IN IRELAND.

There is nothing to report from the Dublin and Belfast Associations.

66, Lorrimore Rd., WALWORTH, LONDON, S.E.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Sept. 17. TREHARRIS.—Additions to shops and altering stables at 35, Fox Street, Treharris, for D. E. Jones, Silbrook House, Whitchurch. Plans and specification may be seen either at 35, Fox Street, Treharris, or at the office of the architect. Endorsed tenders to be sent not later than September 17 to T. Roderick, architect, Clifton Street, Aberdare.

Sept. 17. GUISELEY (near Leeds).—Erection of the Yeadon and Guiseley dual secondary school. Persons desirous of tendering are requested to forward their names and addresses not later than Sept. 17 to Wm. Broadbest, M.S.A., architect, Leeds and Horsforth, when quantities will be forwarded. Plans may be seen and further particulars obtained at the architect's offices, Red Hall Chambers, Guildford Street, Leeds. A deposit of one guinea, payable to M. Rennard, Guiseley, near Leeds, is required.

Sealed tenders, endorsed "Dunmurry Sewer- ge," must be delivered not later than 10 a.m. ct. 12, to William Sinclair, clerk of the council, sburn Workhouse.

Oct. 13. LONDON.—Construction, in the etropolitan boroughs of Deptford and Greenwich. ,026 ft. of cast-iron sewer, for the L.C.C., of hich part is 10 ft. internal diameter, and part in two pipes each 6 ft. 9 in. internal diameter. About 777 ft. of the sewer is to be formed in tunnel and the remainder in open cut. Persons desiring to tender may obtain drawings, specifications, bills of quantities, form of tender and other particulars on application to the chief engineer, Maurice Fitz- maurice, C.M.G., at the county hall, Spring Gar- dens, S.W., upon depositing with the cashier £10. Full particulars of the work may be obtained on application at the county hall, before payment of the fee. Each tender is to be delivered at the county hall, in a sealed cover, addressed to the clerk of the London county council, Spring Gar- dens, S.W., and marked "Tender for Greenwich Road Sewer Extension." No tender received after 11 a.m., on October 13, will be considered. (See also "Engineering.")

ROADS AND CARTAGE.

Sept. 19. FELIXSTOWE.—Steam road-rolling for the U.D.C. Specification and form of tender may be obtained on application to H. Clegg, A.M.I.C.E., surveyor to the council, town hall, Felixstowe. Sealed and endorsed tenders should be delivered not later than Sept. 19 to F. B. Jennings, clerk to the council, town hall, Felix- stowe.

Sept. 19. FELIXSTOWE.—Supplying Guernsey granite, delivered free alongside at Felixstowe docks, or carriage paid to the town station, Felix- stowe for the U.D.C. Specification and form of tender may be obtained on application to H. Clegg, A.M.I.C.E., surveyor to the council, town hall, Felixstowe. Sealed tenders, properly en- dorsed, should be delivered not later than Sept. 19 to F. B. Jennings, clerk to the council, town hall, Felixstowe.

Sept. 19. ROTHERHAM.—Supplying and deli- vering about 2,000 tons of broken granite, to pass through a 2½ in. ring, and for 500 tons to pass through a 1¾ in. ring, for the Corporation. A sample of granite is to accompany each tender; the tender is to state the price per ton of the material delivered at any of the Rotherham stations as directed from time to time by the borough engi- neer. Forms of tender and full particulars may be obtained of Ernest B. Martin, A.M.I.C.E., borough engineer, town hall, Rotherham. Sealed tenders, endorsed "Tender for Granite," to be delivered not later than Sept. 19, to W. J. Board, town clerk, town hall, Rotherham.

Sept. 21. PLYMOUTH.—Making up and com- pleting various roads, for the Corporation. Plans and specifications and conditions may be seen and bills of quantities obtained at the offices of the engineer. Sealed tenders must be delivered not later than 5 p.m. on September 21, to James Paton, borough engineer, municipal offices, Ply- mouth.

Sept. 21. LYMINGTON.—Steam Rolling the main and district roads during the half-year ending March 31, 1909, for the R.D.C. Forms of tender and other particulars can be obtained of S. Crit- tall, surveyor, Sway. Sealed tenders, endorsed "Steam Rolling Tender," must be delivered on or before Sept. 21, to J. Davis Rawlins, clerk to the council, 38, High Street, Lymington.

Sept. 21. RINGWOOD.—Steam Rolling the main roads of the district during the coming season, with one, or (if required) two ten-ton rollers, at per day, inclusive of driver, fuel, oil, and all re- quisites for roller and water-cart, excepting a horse for the latter, for the R.D.C. Tenders to be sent before noon on Sept. 21, to George P. Brown, clerk of the council, Ringwood.

Sept. 21. BARNES. — Paving the carriage- ways of Church Road, High Street, and The Ter- race, Barnes, and High Street, Mortlake, an area of about 15,500 sq. yds., with creosoted Swedish deal blocks laid on a concrete foundation, for the Urban District Council. Plans, sections, and spe- cification can be seen and copies of the schedule and form of tender obtained on application to G. Bruce Tomes, Assoc.M.Inst.C.E., surveyor to the council, the council house, High Street, Mortlake, S.W., to whom tenders, sealed and endorsed "Ten- der for Wood Paving," must be sent not later than noon on September 21.

Sept. 22. ITCHEN.—Execution of street works in a number of roads, for the Urban Dis- trict Council. Plans, specification and conditions may be seen upon application to T. A. Collingwood, surveyor, council offices, Portsmouth Road, Wool- ston, Hants, from whom also bills of quantities and form of tender may be obtained on the de- posit of £3 3s. Tenders, endorsed "Tender for Street Works," to be delivered on or before Sep- tember 22, to W. Henry Bell, clerk to the council, clerk's office, Woolston.

Sept. 22. WEMBLEY.—Making up the second portion of Eagle Road, in the urban district of Wembley. Drawings and specification may be seen at the office of Cecil R. W. Chapman, surveyor to the council, at the public offices. A copy of the quantities, with form of tender, may be obtained upon payment of a deposit of three guineas, at the office of the clerk. Sealed tenders, in the en- velope provided, must be delivered not later than 6 p.m. on Sept. 22, to Fredk. W. Rodd, clerk to the council, public offices, Wembley.

Sept. 23. CHISWICK.—Construction of an underground convenience in Chiswick High Road, for the Urban District Council. Persons desirous of tendering may obtain forms of tender by appli- cation to E. Willis, A.M.I.C.E., surveyor, town hall, Chiswick, where plans, specifications, forms of contract, and bond, and other documents, may be inspected between the hours of 9 a.m. and 1 p.m. Tenders, on the prescribed form, in sealed envelopes (endorsed, "Tender for Underground Conveniences"), together with a schedule of prices, to be delivered not later than 8 p.m. on September 23, to Ernest F. Collins, clerk of the council, town hall, Chiswick, W.

Sept. 24. ROMFORD. — Supplying about 2,250 tons of best blue Guernsey granite, for the U.D.C., broken as to part to 1½ in., and as to other part to 2 in. cube. Forms of tender can be obtained, on application to either J. Turvey, sur- veyor, or the clerk. Tenders, marked "Tender for Granite," with samples, to be sent not later than Sept. 24, to Charles T. King, clerk, council offices, Romford. A contract with bond, with sureties, shall be entered into by the person whose tender may be accepted.

Sept. 26. LETCHWORTH.—Construction of about 2,000 yards of metalled roads in the parish of Letchworth, for the Hitchin R.D.C. Plans and specifications may be seen at the council's offices, old town hall, Hitchin. Tenders marked "Tender for roads ,etc.," to be delivered not later than Sept. 26 to E. A. Passingham, clerk to the coun- cil, old town hall, Hitchin.

Sept. 28. LITHERLAND. — Reconstruction of Violet Road, Litherland, for the U.D.C. Drawings and specification may be seen and quantities, form of tender, and all other particulars obtained, on application to A. H. Carter, surveyor to the council, public offices, Sefton Road, Litherland, on payment of 10s. 6d. Sealed tenders, endorsed "Tender for Violet Road," to be sent before noon on Sept. 28, to William Kirk, or J. W. Allen North, clerks to the council, 15, Lord Street, Liverpool.

Sept. 30. WOKING.—Supplying 2,000 tons of granite, to be delivered at Woking station in such quantities as may be required, for the Urban Dis- trict Council of Woking. Tenders are to be deli- vered, together with sample of material, by Sep- tember 30, to G. J. Wooldridge, surveyor, council offices, Woking.

Sept. 30. LITTLEHAMPTON.—Scarifying and steam rolling of highways, about the district, in the months of November, and December, for the U.D.C. Tenders are to include a ten-ton steam roller, proper scarifier, fuel, oil, driver, driver's house, water barrel, and everything necessary for efficiently carrying on the work. Tenders, under cover, and marked "Steam Rolling," to be for- warded to the chairman of the Urban District Council, town office, Littlehampton, not later than Sept. 30, on forms to be obtained of the surveyor, H. Howard, F.S.I.

MISCELLANEOUS.

Sept. 17. West Norwood.—Manufacture and Delivery at the depot situate in Romany Road, West Norwood, of about 755 lineal feet of Stafford- shire blue purpose-made copings, details of which can be obtained on application to the office of the borough engineer, Lambeth town hall, for the Lambeth borough council. Tenders accom- panied by a sample of an ordinary blue brick for quality, to be delivered in the envelopes provided not later than noon, on September 17, to Henry J. Smith, town clerk, Lambeth town hall, Brixton, S.W.

Sept. 22. RHONDDA (Glam.).—Supplying lead and compo pipe and block tin for the half-year ending March 31, 1909, for the U.D.C. Form of tender may be obtained on application to Octavius Thomas, engineer and manager, gas and water offices, Pentre, Rhondda, Glam. Tenders to be addressed to the chairman of the gas and water committee, endorsed "Tenders for Lead Pipe, etc.," and sent not later than 10 a.m., on Sept. 22, to Walter P. Nicholas, clerk to the council, coun- cil offices, Pentre, Rhondda, Glam. Fair wages clause.

Sept. 23. LANCHESTER.—Fitting-up the work- house, board room, offices, cottage homes, etc., with gas pipes, etc., complete, for the guardians of the union. Drawings, specification and condi- tions of contract may be seen, and forms of ten- der obtained of Geo. Thos. Wilson, architect, 22, Durham Road, Blackhill. Tenders to be sent to W. H. Ritson, clerk, Lanchester, not later than Sept. 23. (See also "Building.")

Sept. 24. THORNTON-IN-CRAVEN.—Asphalting at Elslack new schools Thornton-in-Craven, for the West Riding Education Committee. Plans may be seen and bills of quantities obtained on applica- tion to the architect. Sealed tenders, properly endorsed, to be forwarded not later than 10.30 on September 24, to J. Vickers-Edwards, county architect, County Hall, Wakefield. (See also "Building.")

No date. LONDON, E.C.—Pulling-down and clearing away to cellar level the premises 33, 34, and 35, Gutter Lane ,and 6, Carey Lane, E.C. Applications for specifications, keys, etc., to James W. Jerram, builder, Crown Works, Boundary Road, East Ham, E.

Appointments Wanted.

The charge for Advertisements under this heading is 1s. 6d. per insertion for the first four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two. Advertisements can be received up to 10 o'clock on Tuesday morning.

Advertisements received on Tuesday morning will be found on page xxvi.

REFINED Detail, architect's assistant, fully qualified, 10 years' experience, best work—school, municipal, domestic work. Give part time evenings to competition work; specimens; highest references.—Apply Classic, Box 4533, BUILDERS' JOURNAL Office.

ARCHITECT'S assistant (7 years), thoroughly qualified in ferro-concrete work, London and Paris experience, requires permanency at home or abroad.—Apply Box No. 4562, BUILDERS' JOURNAL Office.

ADVERTISER requires situation in south of England; experienced in all branches of land and building surveying, levelling, quantities, dilapidations, 5 years with Urban Council, near London; good draughtsman; qualified P.A.S.I.—Box 4538, BUILDERS' JOURNAL Office.

ARCHITECT'S Assistant (22½) desires engagement; six years' experience; good knowledge of domestic and city warehouse work; 1st class honours construction. Student R.I.B.A.—A. T., 2, Avenue Road, Forest Gate, E. 4568

ARCHITECT (practising) is willing to assist others in all kinds of architectural and office work, at own office, or elsewhere.—S., 143, Cannon Street, E.C. 4528

ARCHITECT (age 29), desires post as traveller calling on architects, builders, etc. (north preferred).—Address Box 4497, BUILDERS' JOURNAL Office.

ARCHITECT and surveyor's assistant desires engagement, 15 years' experience; good draughtsman, colourist, etc., working drawings, details, specifications, surveying, levelling, and general routine; moderate salary; excellent references.—A. R., 1, Ivy Villas, Cheam, Surrey. 4557

ARCHITECT and Surveyor's Assistant (24); 9 years' London exp.; working drawings, specifications, superintendence, quantities and land surveying; prizeman, architectural drawing, and quantities; medallist building construction; excellent testimonials; mod. sal.—W., 20, Holmewood Road, Streatham Hill, S.W. 4498

ARCHITET'S and Surveyor's Assistant (21) requires engagement with good architect, 3½ years' student in architect, construction and kindred subjects, land surveying and levelling. Board of Education qualifications; prelim. R.I.B.A., refs.—Apply Box 4572, BUILDERS' JOURNAL Office.

A Practical estimator will be pleased to price builder's quantities or give estimates from plans and specifications for tendering, quickly by post. Send for lowest terms.—Estimator, c/o Mr. Moth, Baddow Road, Chelmsford. 4535

ARCHITECT and Surveyor's Assistant (21), good draughtsman, details, perspectives, surveying, levelling, etc. Prize-winner, first class advanced building construction, and architecture certificates —S. K., Prob.R.I.B.A., first-class refs.; moderate salary.—Box 4578, BUILDERS' JOURNAL Office.

ARCHITECT and surveyor's managing assistant, A.R.I.B.A., desires engagement at home or abroad. Twenty years' experience. Good testimonials and references.—C. A. C. Springfield, 31a, Leyland Road, Lee, S.E. 4542

ARCHITECT'S Assistant, well recommended, 14 years' good all-round experience; practical, working and detail drawings, quantities, specifications, supervision; salary 2½ guineas. — Box 4536, BUILDERS' JOURNAL Office.

ARCHITECT and surveyor's junr. assistant; 5½ years' experience; working and detail drawings; levelling, perspectives, specifications; assist quantities; excellent testimonials; moderate salary.—Box 4546, BUILDERS' JOURNAL Office.

ARCHITECT'S assistant, experienced in working drawings, details, surveys, etc.; first-class references; specimens of work; orders taken for water colours, perspectives, deed plans for conveyancing, drawings, designs, etc.—Aubrey Pritchard, Bryndenden, Rhyl, N.W. 4549

ARCHITECT and surveyor's assistant, 10 years' good all-round experience, north and south; take charge; capable draughtsman; working drawings, details, quantities; moderate salary.—W. T., 49, Whitstable Road, Canterbury. 4561

ARCHITECT'S Assistant, 7 years' experience, desires engagement in London or provinces; designs, working drawings, details, etc.; excellent references; moderate salary. — Apply Box 4548, BUILDERS' JOURNAL Office.

BUILDER'S clerk, used to double entry, dissecting time sheets, etc.; good general experience; draughtsman; within 60 miles radius.—Henry, 4, Plimsoll Road, Finsbury Park, N. 4493

BUILDER, with nine years' experience in first-class house-building and general repairs, desires appointment; fair draughtsman, well up all trades, tradesman; moderate salary; highest references. —Box 4507, BUILDERS' JOURNAL Office.

BUILDER'S Assistant (23), disengaged; construction, surveying, mensuration; fair knowledge quantities and levelling; also costs, accounts, wages, etc.; good draughtsman; supervise jobs and assist estimating.—Box 4523, BUILDERS' JOURNAL Office.

BUILDER'S Clerk and assistant (20), seeks engagement, general experience, book-keeping, time sheets, plans, etc.; good references, and moderate wages.—Apply Box 4555, BUILDERS' JOURNAL Office.

CARPENTER and joiner, 32, wide experience, all branches of building, take charge; good references; very energetic; good manager and timekeeper.—Pearson, 53, Hartham Road, Isleworth, W. 4552

CARPENTER and joiner, work wanted, piecework; any quantity; labour only; good references.—W., 14, Gorrings Park Avenue, Mitcham, Surrey. 4526

CARPENTER and joiner wants work; bench fixing, alteration, or jobbing. Could take charge of general work. Life abstainer. Good references. Age 32. Very energetic.—Pearson, 53, Hartham Road, Isleworth, W. 4471

CLERK of Works; age 30; practical and reliable; exceptional experience with buildings, plans, etc.; architectural training; would serve part time in office; cyclist.—Box 4464, BUILDERS' JOURNAL Office.

CONTRACTS.—Estimator, measurer, etc. (London and country experience), requires position. Successful in tendering. Can guarantee brisk business. Make most of measured accounts, and practically and efficiently help with management. Country preferred. Small salary. — Estimator, Durston House, The Grove, Deal. 4564

ENGINEER wants post, London or provinces; 12 years' experience; or undertakes preparations, calculations, quantities, designs, detail drawings, structural steelwork, and reinforced concrete.—Box 4451, BUILDERS' JOURNAL Office.

ESTIMATOR and building surveyor, Q.S.A., desires re-engagement with builder, architect, or surveyor; permanent or temporary; estimates, quantities, measurements, variations and accounts.—A 768, Fulham Road, London, S.W. 4501

ESTATE Clerk of Works, all-round town and country experience; surveying, plans, quantities, etc.; considered good manager of men; character will bear strictest investigation.—Apply Box 4566, BUILDERS' JOURNAL Office.

FOREMAN seeks engagement; shop or building; carpenter, joiner, practical, machinery, quick setter out; last refs. 7 years; age 38.—C. M., Cedars, Spring Road, Kempston, Bedford. 4483

GENERAL Foreman, long and varied experience in town; thoroughly practical; good at reinforced concrete work; trade joiner; moderate wages; good references.—50, Peel Road, Wembley. 4565

IMPROVER, brass-finisher, requires situation; 3 years' previous experience with well-known London firm; excellent references. Apply Box 4550 BUILDERS' JOURNAL Office.

IMPROVER or junior assistant (23), varied experience, neat draughtsman, surveying, assist with quantities; excellent references; small salary return for first-class experience. — Apply Box 4559, BUILDERS' JOURNAL Office.

JUNIOR requires situation in builder's or surveyor's office; capable tracer, draughtsman and colourist, knowledge of quantities and perspectives, and land-measuring; moderate salary.—Muggeridge, 152, Fleet Street, E.C. 4577

MACHINIST (joiner) requires re-engagement; good spindle hand, used to first-class work; 10 years last place; good references.—H. Cruse, Boxford, Newbury, Berks. 4537

PAPERHANGER, practical, wants piecework; builders' flats, hotels, and clubs.—S. Jamer, 48, Carlisle Street, N.W. 4539

PLUMBER, experienced (registered), gas and hot water fitter, new jobbing, sanitary work, good lead layer, desires permanency; excellent references; town or country. — Box 4556, BUILDERS' JOURNAL Office.

PLUMBER (Registered) wants re-engagement as leading hand or otherwise. Thoroughly practical in all latest sanitary improvements. Town or country.—R. P., 18, Chertsey Street, Tooting, S.W. 4482

QUANTITY surveyor and draughtsman requires engagement; 15 years' experience; taking-off, etc., working drawings, specifications, supervision; passed final examination, Quantity Surveyors' Association; provinces preferred; low salary.—Box 4544, BUILDERS' JOURNAL Office.

WRITER, grainer, paperhanger, and painter. Builders' painting taken (piecework if desired). Any distance. Reliable and energetic. Estimates free. Life experience. Moderate.—H. Rivers, Evesham Road, Reigate. 456

Appointments Vacant.

TRAVELLER wanted, with established connection amongst architects, builders, contractors, decorators, etc., to sell marble and other reproductions. Must have exceptional references as to ability.—Apply 2, Church Row, Limehouse, E., between 10.30 and 4 p.m. 457

BUILDER'S Assistant desires situation. Sixteen years' experience in office routine, estimating, measuring, accounts, etc. Also experienced in out door management. Moderate salary.—W. P., 65 Leicester Road, East Finchley. 456

ARTICLED pupil, boy just leaving school, required by architect and craftsman for special work. Must have good aptitude for draughtsmanship. Premium required. — Geo. P. Bankart, Baldwin's Gardens, Gray's Inn Road, E.C. 457

ARCHITECT'S pupil, vacancy in busy West-end architect's office; small premium required but must be fond of drawing.—Stanley-Barrett and Driver, 23, York Place, Baker Street, W. 452

Miscellaneous.

BUILDERS' Books at tremendous reductions! Books on every subject and for all examinations supplied; sent on approval. Catalogues free; state wants. Books purchased.—W. and G. Foyle, 133, Charing Cross Road. W.C.

SECOND-HAND Optical Mart. for the Purchase and Sale of LEVELS, THEODOLITES, DRAWING INSTR —Clarkson's, 338, High Holborn, London, W.C (Opposite Gray's Inn Road).

FOR sale, mortar mills, stone breakers, portab engines, portable railway side tip wagons, stea and hand pumps; hand Derrick cranes; woo working machinery; brick and tile plant.—Georg Dean, Foley, Longton. 45

TO close an estate. — Large quantity of woo chimney pieces and overmantels for sale; great reduced prices to clear quickly.—Executors of W. Grove, 27, Parade, Leamington Spa. 45

CONCRETE BALLAST, open to cheap offer; an quantity, or will correspond. Can be seen at L Maynard, Dawley, nr. Hayes, Middlesex.

Businesses for Sale.

NEWPORT, SHROPSHIRE.

To be sold, the old-established builders' an contractor's business for many years carried by Mr. George Ingram Muirhead, and for som time past known as "George Ingram Muirhea Ltd.," situate adjoining and fronting the ma road near the station (L. and N.W. Railway Newport, Salop.

The yard is well equipped with all mode machinery and plant, and immediate possessi can be given; all contracts just completed, stoc in-trade, machinery, etc., at a valuation; insp tion by appointment.—Apply to Messrs. Poo and Davies, Auctioneers and Valuers, Newpo Shropshire. 4

Competitions Open.

COUNTY BOROUGH OF BURY.

EDUCATION COMMITTEE.

The Council invite COMPETITIVE DESIG for a NEW SECONDARY SCHOOL to be erec in the borough.

A competent Assessor will be appointed, and the designs adjudged by the Assessor to be 1st, 2nd, and 3rd in order of merit, premiums £50, £25, and £10 respectively will be awarded

For copy of conditions, instructions, etc., plan of site, address the Director of Educati 8, Bank Street, Bury.

JOHN HASLAM, Town Clerk 4

Municipal Architects.

The case against the appointment of municipal architects is succinctly stated in a letter, signed "Architect," that appears in the Press of Bradford, where the question happens to be of immediate interest. While, however, the instance is merely local the principle involved is, of course, of common application, and is, therefore, open to general discussion. The post of Bradford City Architect being vacant, the consideration of the subject was deputed to a Corporation committee, and "Architect" very thoughtfully contributes a few observations that may possibly assist them to a just conclusion. That it may conceivably have exactly the opposite effect is a contingency that need not greatly concern us. It is pointed out that in Bradford, as elsewhere, architects cannot just now get enough work to keep them healthily occupied (that being possibly a reason why so many of them are writing letters to the Press), and he thinks that, in mitigation of this deplorable epidemic of unemployment, municipal commissions should be fairly distributed among competent architects, who it is urged—perhaps somewhat fortuitously, considering the depression of trade—"all pay rates." He claims that without doubt the work would be as well done by private practitioners as by a city architect, and that it would probably be done more economically by the former, who, moreover, by force of their mere numerical superiority, must necessarily represent a greater diversity of gifts, and attain to greater variety in design than would be possible in a one-man series of buildings. That is, we think, a fair summary of the arguments by which "Architect" seeks to show that the office of city architect should be abolished. His views are probably held by the majority of architects who as yet lack official appointments, and have no strong sustaining hope of getting them. It will not be denied that monotony of production almost invariably tends to monotony in the product: as, for instance, the elementary schools in many a official-ridden city bear drearily reiterative witness. There is less to be said against the retention by a municipality of the services of an architect whose function is understood to be advisory rather than executive. Even in his consultative capacity, he enjoys quite sufficient opportunities of impressing his personality on designs that are prepared in accordance with his advice, and in more or less spiritless compliance with his known preferences and proclivities, not to say fads and fancies; but to expect the official architect to design outright every building, large or small, that an expanding municipality requires, is to impose too heavy a burden on the architect, and "too much Johnson," or whatever the architect's name may happen to be, on a long-suffering community.

The Palace, the Monument and the Marble Arch.

Mr. William Woodward, F.R.I.B.A., has communicated to the press some characteristically breezy and bracing notes on the Mall and Marble Arch improvements. His chief point is that the grandeur of the monument to Queen Victoria, with Sir Aston Webb's architecture and Mr. Brock's sculpture, will, by its grandeur, so accentuate the meanness of Buckingham Palace, "that the cry for a new palace, worthy of the Majesty of King Edward VII., and of his successors, will be strongly asserted." Few architects will consider that Mr. Woodward's condemnation of Buckingham Palace is too severe. Originally known as Arlington House, it was rebuilt in 1703 by that Duke of Buckingham who was the patron of Dryden. It was bought by George III. in 1761; but it was under George IV. that, in 1825, John Nash began its conversion into a palace. Then, according to a critic who, writing nearly sixty years ago, naturally lacked the suavity of Mr. Woodward's epistolary style, Buckingham Palace became "such a complex medley of the costly and the shabby, in various styles and various materials, as to defy description." It was altered by Mr. Blore for the reception of Queen Victoria; and the same architect, in 1846, was commissioned to add the east side, which cost about £150,000. Granting the desirability of substituting a palace that shall be worthy of the Empire and of its capital, what a glorious opportunity has been missed of designing the palace as an integral feature of the scheme! Whether it is easier to build a palace to fit a memorial, or to build a memorial to fit a palace, is not the question. The point is that it would be better for both to be designed simultaneously, and this is the opportunity that has been thrown away. Sir Aston Webb's design for the monument must have been influenced by the present palace; and therefore the future palace, if we are to have one, must, if it is to agree with the monument perpetuate certain features that are perhaps undesirable, and might have been eliminated if the architect had been free to design a complete scheme. That the architect has been seriously hampered in other ways is very obvious from Mr. Woodward's confident appeal for the immediate demolition of Drummond's Bank and a few houses adjoining, and for the widening of Charing Cross "at the bottle-necked end." As to the Marble Arch, Mr. Woodward is by no means alone in his complaint that the arch "is now left alone in glorious isolation, divested of its former clothing of railings and lodges, and absolutely without meaning." It should, he thinks, be moved bodily back to the new gates at the centre of the new curve. Here, as in the case of the Mall improvement, Mr. Woodward makes a very palpable hit.

Arbitration and Conciliation.

Mr. Winston Churchill's proposed Standing Court of Arbitration for the settlement of trade disputes is of more interest to builders than to any other section of the community, because of the enormous number of persons comprised in the trade, and because the circumstances and details of building lend themselves peculiarly to the marked tendency to disputatiousness which they have probably engendered. Builders are spread over the kingdom more evenly than other industrial classes. Hence the disputes that arise are local and numerous, so that builders are likely to figure with unrivalled frequency in the annals of the Arbitration Court: that is, if they can be induced to resort to it. But, since they have anticipated it by the formation of Conciliation Boards, which, so far, are working very satisfactorily, it is very doubtful whether they will consent to abandon them in favour of Mr. Churchill's scheme. The court is to comprise (1) "persons of eminence and impartiality;" (2) assumed impartial persons of the employer class; and (3) assumedly impartial workmen and trade unionists. It seems clear to us that, on the face of it, a court thus composed would be far less competent to deal with building disputes, and far less sensitive to the nice points that occasionally arise (and nice points sometimes form the very essence of the argument) than are the Boards that are now winning or have already won the confidence of employers and employed in the building trade. These Boards may possibly be more

rough-and-ready in their constitution and in their methods of procedure than the proposed court; but they are for this very reason likely to be preferred. There is in them an element of warm-blooded humanity that is likely to be absent from the Arbitration Court, which will be curiously untrue to type if it escapes the usual arid and academical formality of official institutions. The new court may be useful as a last resort or court of final appeal when all other means have been exhausted; but we confess that we should be surprised to find it superseding the admirable Conciliation Boards which the building trades, and in particular the Master Builders' Federation, have established so wisely and so successfully. Domestic quarrels are best settled at home, when "the stranger intermeddleth not." These views are our first impressions of the new proposals, upon which, doubtless, the National Building Trades Federation and other bodies will shortly deliberate.

Inviting Tenders for Professional Services.

An advertisement in a contemporary inserted by the St. Marylebone Borough Council, in which qualified quantity surveyors are invited to tender for preparing bills of quantities for some new buildings about to be erected, introduces what we believe to be a novel method of engaging responsible professional services, and one which in the public interest it is devoutly to be hoped will not become general. We note with satisfaction the extension of the practice of the direct appointment of quantity surveyors by public bodies, and fully recognise that the members of the Borough Council to whose advertisement we refer have adopted this course in the mistaken belief that they are acting in the best interests of their constituents. Indeed, the mere fact that *this* system has been followed is sufficient evidence (in the absence of any other) that they are unfamiliar with the technicalities of the work, and cannot appreciate the fiduciary nature of the position a surveyor is called upon to fill.

A quantity surveyor is in nearly every instance employed in a dual capacity, *i.e.*, in the first instance as a servant or agent of the employer in the preparation of the original bill of quantities, and, on the completion of the work, as an arbitrator to settle the amount which should be paid or credited for variations between the contractor on the one hand and the public authority on the other, and therefore these appointments should only be conferred on those gentlemen whose integrity is beyond question and who possess the highest possible professional qualifications. The St. Marylebone Borough Council, however, which has resorted to the practice of inviting surveyors to tender for employment, and which no doubt intends to entrust the work to the lowest tenderer, will probably obtain the services of some irresponsible person with little training, knowledge, or experience. He will no doubt quote a fee for preparing their quantities which would be an altogether inadequate remuneration for the work involved in their accurate preparation, and for the responsibility incurred. The interests of the ratepayers will suffer by the fact that the best services obtainable are not secured, and also from the fact that the underpaid person employed may not be proof against the temptation to seek other means of recouping himself.

It is impossible for a layman to decide what are fair and reasonable fees, as quantity surveyors' charges vary widely according to the character of the work, and in order to minimise this difficulty, the Surveyors' Institution has recently issued a memorandum (circulated amongst public authorities) in which they offer to advise (in an honorary capacity) a public body desirous of settling the proper fee to be paid for any particular work. In addition, the more practical Quantity Surveyors' Association some years ago issued a moderate scale of charges (also circulated amongst all public bodies) in which sliding scales of fees are given for public buildings of any character and of varied magnitude. The St. Marylebone Council elects to ignore both the professional societies to which we allude, and will, presumably, appoint to a position in which judicial or quasi-judicial services are required, the candidate willing to accept the lowest remuneration.

Notes on Competitions.

Linthorpe New Secondary School.

Messrs. Clarke and Mosscrop, and Mr. Whipham, architects in Middlesbrough, have written to the Middlesbrough Education Committee complaining that though ratepayers in the town, they were not invited to compete. Though the principal office of Messrs. Clarke and Mosscrop is at Darlington, they have one at Middlesbrough, and they point out that at least three of the competing architects had offices in other towns. Mr. Whipham both resides and practises in Middlesbrough. The chairman feared that it was now too late for any reconsideration. He suggested that the clerk be instructed to make a memorandum of the letters in the minutes.—Dr. Ellerton thought the committee had made a very big mistake. The two firms were both ratepayers, and were not asked to compete.—Councillor Dorman thought that in future they ought to ask all architects in the town to send plans.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Oct. 7	INVERNESS. BOAT SHELTER. Engineers invited to submit plans for a scheme, not exceeding, in cost, the sum of £10,000. Conditions from Kenneth Macdonald, Clerk to the Harbour Trustees, Town House, Inverness.
Oct. 31	BURY. NEW SECONDARY SCHOOL for the Education Committee. Premiums of £50, £25, and £10. Particulars and site plan from Robert Wilkinson, Director of Education, 8 Bank Street, Bury. Deposit £1 1s.
Oct. 31	*ROMFORD. COUNTY HIGH SCHOOL FOR GIRLS. Applications for Conditions to D. T. Williams, 71, South Street, Romford, Essex, to be made by or before August 24th, accompanied by deposit of five guineas, of which sum five pounds will be returned on receipt of bona fide design.
Nov. 1	CARDIFF. COUNTY HALL AND OFFICES. Particulars and site plan from T. Mansel Franklen, Clerk Glamorgan County Council Offices Cardiff.
Dec. 14	BLACKPOOL. CENTRAL PUBLIC LIBRARY.—Premiums of £52 10s £31 10s. and £21. Particulars and site plan from T. Loftos. Town Clerk Town Hall, Blackpool. Deposit £1 1s
No Date.	CORNWALL COUNTY OFFICES.—Designs and *Estimates* invited Premiums of £50. £20 and £10. Premium for successful design to merge in Commission. Particulars from C. L. Cowlard, Clerk to County Council Bodmin. Deposit, £1 1s.

* *This competition has been unfavourably reported upon by a Correspondent.*

S. SERNIN, TOULOUSE: THE EAST END. DRAWN BY LESLIE WILKINSON.

This church, the finest example of the round-arched barrel-vaulted style as distinguished from the dome Romanesque churches of Aquitania, was dedicated in 1096. It is 375 feet long and 217 feet in width across the transept externally, and consists of a nave with double aisles. Transept with an aisle all round, an four eastern chapels and a chevet of five more chapels. At the crossing is a graceful octagonal towe in five stages crowned by a spire reaching to a height of 230 feet from the ground. It is built of red bric and light stone most beautifully weathered and blended together by age. The roofs are covered wit lead, and there is some interesting and well-executed carving.

OF THE
UNIVERSITY OF ILLINOIS

View from the Lawn.

THE COTTAGE, BULSTRODE WAY, GERRARD'S CROSS. FAIR AND MYER, ARCHITECTS.

Salisbury.—The open competition for an isolation hospital for 44 beds, to cost about £12,000, has just been decided, and the first premium of twenty guineas awarded to Mr. J. H. Goodman, of Reading, and the second premium of ten guineas to Messrs. J. I. Barton and George Boughton, M.S.A., of Ryde, I.W.

THE ARCHITECTURAL PROFESSION OF TO-DAY.—II.

It can scarcely be urged, at least with any show of reason, that the few measures of reform which, we understand, are to be incorporated in the mysterious document (now for so long in course of preparation) known as the Revised Charter of the Royal Institute of British Architects, will be productive of any very beneficial results to the profession at large. For most of the suggested alterations connected with the conduct of architectural affairs which it embodies are only intended to apply, and of necessity can only apply, to the internal administration of a society whose total membership numbers, in all probability, considerably less than one-third of the practising architects in the United Kingdom. Thus restricted, the Institute cannot aspire either to speak or to act as it would were it strengthened by the full weight of the authority of a large proportion of the whole profession. But, apart from this circumstance, the R.I.B.A., which is, unfortunately, at present far too organically weak to control effectually the actions of its own members, could not, even if it were so disposed, do more than take part in any movement for the eradication of the evils which more or less affect the welfare of *all* architects, whether members of the Institute, of any other society, or of the numerically large body of practitioners which has hitherto held itself aloof from any professional organisation whatever. But in any scheme of progressive reform that may be inaugurated in the near future the diverse material interests of the representatives of these three component parts of the whole architectural profession must assuredly be taken into account, for otherwise the remedial measure proposed will be foredoomed to failure.

Yet whilst it must thus, in all fairness, be conceded that the R.I.B.A., despite its standing as the premier architectural society, is not in a sufficiently favourable position to formulate, and carry to a successful termination by its own unaided efforts, a wise and comprehensive scheme of reform framed to benefit the entire profession, yet, on the other hand, the record of its own governing body appears to show that it is, to say the least, extremely doubtful whether, if officially approached on the subject, it would be found to be in sympathy with, and willing to bear its share of the labour involved in, any such salutary proposal.

For example, has not the R.I.B.A. on several occasions allowed its own conditions and regulations of membership to be set aside, if not absolutely ignored, by architects who were pledged to observe and respect them? Has not its Council permitted, and even encouraged, certain privileged persons to act in the dual capacity of assessor and joint architect, and can the Council of the R.I.B.A. be said to have faithfully fulfilled its obligations to the general body when it allowed a member of the Institute to act as assessor in a limited competition in which one of his own employees was engaged? For these and for many other reasons, in our judgment, the Royal Institute of British Architects is unlikely to take the initiative, or, indeed, a leading part, in any movement intended for the amelioration of the existing unsatisfactory conditions under which the rank and file of the profession follow their avocation, and some other means must, therefore, be sought out for forming an organisation to protect the interests of architects, and to increase the commercial value of the services of the properly equipped and trained practitioner. As is well known, the Institute's own half-hearted efforts to formulate and present a Bill for the Registration of Architects ended in a ludicrous compromise, which, if it ever take tangible shape, may, perhaps, prove of some benefit to the R.I.B.A. itself, but outside the body is not unlikely to be absolutely useless.

It is an open secret that, in addition to the apparently unaccountable *volte-face* displayed by the electorate of the R.I.B.A., many of the misfortunes which so persistently dogged the progress of the last Registration Bill were due, in a large measure, to the petty jealousies and selfish conduct of some commercially successful architects who objected to the enrolment of their own names side by side with those of their less fortunate brethren.

If this small-minded and, as we venture to think, even contemptible prejudice is too deeply rooted in the minds of these so-called "leaders" of the profession to be displaced by logical arguments, it should be made quite clear to all architects who thus base their opposition to the principles of registration upon these petty personal grounds that the Institute was formed for "the general advancement of civil architecture," and "for promoting and facilitating the acquirement of the knowledge of the various arts and sciences connected therewith," and *not* for the personal glorification and aggrandisement of a few of the more prominent or more self-assertive of its members. It may here be not out of place to refer in terms of strong deprecation to the conduct of those members of the R.I.B.A. who, on the appeal of the occupant for the time being of the Presidential chair, or at the instance of some fluent past or present member of the Council (whose oratorical services have been specially secured for the occasion) often set aside their personal convictions, and by voting against their own better judgment, prevent the adoption of some of the well-considered measures of reform which are brought forward from time to time at the general meetings of the Institute. Such conduct is neither honest nor reasonable, and exhibits a great want of loyalty to the general body of the Institute, the large proportion of whose members are undoubtedly in favour of a wise progressive policy; and the sooner the exercise of this *undue* personal influence is abolished at the Royal Institute of British Architects, the better it will be for the welfare of that somewhat inscrutable body.

Men who are, naturally, too old to exchange the cherished convictions of a lifetime, and have had neither the opportunity nor the inclination to examine personally the seamy side of an extremely ill-regulated and arduous calling, are not always the best possible guides to follow in any burning question of the day. Thus many of these "leaders," although they are probably ignorant of the fact, are so unsound in their architectural scholarship that it is well nigh impossible to make them realise that the sole hope of rescuing architecture from its present state of decadence lies in the adoption, *inter alia*, of some well-devised system of compulsory education and training for its students. And it is the deplorable lack of scholarship perceptible in the works of many of the best-known architects of the day which often re-acts so injuriously on the prospects and welfare of some of the younger and better trained men. How many architects, in these days, are prepared to throw their whole energies into the preparation of competitive designs for a building to be adjudicated upon by an assessor, or assessors by whom the very first principles of design are either unknown or consistently ignored? True, there must necessarily be *something* in the nature of a lottery in every architectural competition, but this element of chance should never have been allowed to assume its present colossal aspect. Architects who are accustomed to produce work of a scholarly type ought not to be too severely penalised by the predilection of an unscholarly assessor for architecturally inferior designs. Although the adoption of some system of registration, by means of which it would be possible to exercise sufficient control over the professional conduct of all enrolled members—to limit, from time to time, as occasion required, the number of young men allowed to enter the ranks of the profession; to devise a satisfactory scheme of compulsory education; and to solve the difficult problem relative to the equitable and just conduct of architectural competitions—could not fail to be conducive to the welfare of the profession, there would still remain many grievances, for which no Registration Act that could possibly be drafted would prove an immediately effectual remedy. How, for instance, do those in favour of closing the profession hope to entice the public, still swayed by the bizarre attractions of the profane love—the tradesman-architect—back to the sacred fire of the devotees of the art of architecture? In short, after the schools of architecture have been firmly established and properly organised, when the architectural "business" of to-day, in which the spirit of commercialism is far too often in evidence, has possibly been transformed into the great "art" of to-morrow, will architects then really enjoy a larger share of the patronage of the "bargain-loving" public than they do to-day? Even should the art of architecture once again resume its proper function as the very centre of all artistic life and activity, how can the public, should it still desire to do so, be prevented from availing itself of the all too freely proffered services of the tradesman-architect, the untrained genius, or the building surveyor, in preference to those of the highly cultured and well-educated artist?

Our Plate.

The cottage, Bulstrode Way, Gerrard's Cross, was built for Admiral Dunlop from the designs of Messrs. J. W. Fair and Val Myer, A.R.I.B.A., of London. It has cavity walls covered with coarse roughcast, with quoins and base in red sand stocks; the roofs are covered with hand-made tiles. Internally the house has brick fireplace and ingle, with beamed ceilings to the drawing-room and hall, and enriched ceiling to the dining-room. In addition to the ordinary water service to the lavatories, there is also a rain-water service.

Proposed New Works.

Atherstone.—The R.D.C. have passed plans for two cottages for Mr. C. Atherton-Brown.

Billericay, Essex.—Plans for the rebuilding of the gymnasium at Brentwood Grammar School have been approved by the Billericay R.D.C.

Billinge.—The L.G.B. have held an enquiry into the application of the U.D.C. to borrow £12,000 for water supply work, including the construction of a reservoir to contain 8,000,000 gallons.

Bolton.—Mr. Andrew Carnegie has expressed his willingness to contribute £15,000 towards the erection of three branch libraries, and the Libraries Committee have recommended the Council to accept the offer.

Boston.—The Education Committee are proposing to spend about £3,600 on a new school on Carlton Road. The plans have been forwarded to the Board of Education.

Bradford.—The City Council will shortly consider the question of erecting a sanatorium for consumptives, to provide accommodation for fifty patients. The cost is estimated at £230 per bed, exclusive of the land.

Brimington.—Mr. R. F. Mills, of Tapton Grove, having given a free site, the parishioners of Brimington are collecting funds for the erection of a church institute and Sunday school, estimated to cost £2,038.

Burnley.—The Corporation have several improvement schemes maturing. Application for a loan of £500 to lay out a new street from Parker Lane to Finsley Gate, and for a loan of £1,925 for improvements in Cog Lane, will be made to the L.G.B. immediately.

Bury St. Edmunds.—The Borough Surveyor's plans for the conversion of the Town Hall into municipal offices have been generally approved by the Town Council, and referred to the General Purposes Committee to ascertain the probable cost.

Chatham, Kent.—The Town Council have approved plans for the following:—Cesspool at No. 168, High Street, for Messrs. W. Paine and Co.; villa at Maidstone Road, for Mr. A. Burtenshaw; shop front at Magpie Hall Road, for Mr. C. Moakes; stables at Walderslade, for Mr. F. Friday; club room at rear of mission room, Pagitt Street, for Rev. C. J. La Touche; Mission Church, Walderslade, for Rev. C. J. La Touche.

Clackmannan.—Tenders are to be invited for the extension of the county buildings for the Clackmannan County Council. The cost estimated by Messrs. Melvin and Kerr, the architects, is about £5,000.

Darlington.—The following plans have been passed by the Town Council:—Messrs. J. P. Pritchett and Son, alteration of house and shop, 7, Cleveland Street; Messrs. Kitching and Lee, additions to two houses, Staindrop Road; Messrs. Hoskins and Brown, three houses, Elton Parade; and additions to Union Offices, Crown Street.

Elland.—Sites have just been secured here for a new post office and a new secondary school. The former will be erected at the corner of Timber Street and Southgate Street, and the existing buildings are to be altered for the purpose. The school is to be erected in Victoria Road.

Glasgow.—The munificent gift of £100,000 by Mr. Carnegie to supply 14 libraries in Glasgow has only sufficed for 12, and on these the sum mentioned has been exceeded by £5,000. Mr. Carnegie has, in consequence, offered to give another £15,000 for the two remaining libraries at Hillhead and Langside.

Grimsby.—The Corporation are considering the question of erecting Municipal Offices. The design, prepared by the Borough Engineer, was criticised by one councillor as being like a factory, but that official pointed out that a handsome building could be provided if the Council would assent to the cost. £16,000 is about the cost of the present scheme. A sub-committee was appointed subsequently to confer with the engineer as to the amendment of the scheme.

Guiseley.—Dr. Tristram, Chancellor of the Ripon Diocese, has held a Consistory Court at Guiseley to enquire into an application by the rector and churchwardens of the parish church of Guiseley for a faculty to authorise "the taking down of the present north aisle of the church, and the erection of a new chancel, central and north aisles, transept, organ chamber, and choir and clergy vestries, and the interference with certain vaults and graves on the east and north sides of the church." Dr. Tristram decreed the faculty in the terms prayed. The accommodation in the church will be increased from 300 to 642, and the cost of the alterations is estimated at £5,000. The plans have been prepared by Sir C. A. Nicholson, F.R.I.B.A., of London.

Hammersmith.—The Workhouse, which from its luxurious fittings and appointments, achieved a rather unwelcome notoriety, and the burden of a Local Government Board enquiry thereby last year, is now declared says the "Daily News," to be too small, and that the question of its extension will shortly come up before the Guardians.

Hull.—The Board of Guardians are considering a much-needed extension to the workhouse building, to provide accommodation for another 120 inmates. Messrs. Gelder and Kitchen are the architects mentioned in the matter.

Inverurie.—Mr. George Gray has prepared plans for the extension of the library and town hall, for which Mr. Carnegie has been asked to make a grant. At present Mr. Carnegie is not inclined to accede to the Town Council's request, owing to some disagreement as to the best scheme for the extension.

Llandaff Diocese Churches.—The Llandaff Diocesan Church Extension Society has made the following loans and grants: Bargoed, parish hall, grant £60, loan £200; Cadoxton-juxta-Neath, church at Crynant, grant £50, loan £300; Ebbw Vale, mission hall, grant £50, loan £200; Llanhilleth, new church, loan £300; Mountain Ash, new church at Miskin, grant £50, loan £200; Pontypridd, new church at Coedpennmaen, grant £50; loan £300; Garw Valley, new Welsh church, grant £50, loan £300; St. John's, Ebbw Vale, new church, grant £100, loan £400; Tylorstown, new Welsh church, loan £200; St. John's, Canton, new church, grant £100, loan £400; Treharris, new church at Bedlinog, grant £100, loan £400; Cwm, enlargement of church, loan £200.

London.—Sir Aston Webb, R.A., has been commissioned to prepare plans for the Mining and Metallurgy Department of the Royal School of Mines, which is to be erected at South Kensington on land adjoining the Royal College of Science, by the same architect.

London: Bethnal Green.—The Local Government Board have granted the Borough Council a provisional order for the compulsory purchase of the property in Patriot Square, which is required for the site of the new municipal buildings to be erected at a cost of £30,000.

London W.C.—The church of Holy Trinity, Kingsway, has been closed as a dangerous structure, by order of the County Council. Its condition is reported by experts to be due to the neighbouring excavations and building operations of the County Council and one of the tube railways, who have offered, between them, £1,200 as compensation, towards the £4,500 which will be required for repairs.

Lynn (Norfolk).—The Town Council have approved the following plans:—New shop front, Saddlebow Road, Mr. J. Medwell; shed, South Quay, Messrs. A. and J. Bowker; new scullery, Linay's Yard, Church Street, Mr. Huddlestone's executors; two new houses, Sidney Street, Chase Estate, Mr. C. D. Allflatt; new shop front, 49, High Street, Mr. G. Goddard; four new cottages, Cresswell Street, Mr. S. Baker; covered way, Sir Lewis Street, Mr. S. Baker; new warehouse, Surrey Street, Mr. J. Skinner. By their approval of the plans for the four cottages in Cresswell Street, the Council are breaking their own by-law requiring an open space of 150 square feet, the space provided being 132 sq. ft.

Norton Woodseats with Norton Lees.—Plans have been prepared for the new parish-room and new Sunday schools at an estimated cost of £3,000.

Penzance.—The Town Council has approved plans for the following:—Mr. Bartlett (per Mr. O. Caldwell), erection of two dwelling-houses at Pendarves Road, on the Tremenheere estate, subject to proper lighting and ventilation of outside w.c.'s. Mr. Walter Reynolds (per Mr. H. Maddern), erection of bay window and alterations to wash kitchen at Glendower, Mennave Road, subject to the consent of the adjoining owners being obtained to the erection of bay windows, and also proper cleaning arrangements being provided for "copper" flue, and pipes being covered with asbestos from inside of wall to flue.

Perth.—The City and County of Perth Royal Infirmary Directors are considering plans, prepared by Mr. J. J. Burnet, A.R.S.A., of Glasgow, for a new infirmary, to contain 100 beds. The estimated cost is £50,000.

Poole.—The Town Council have approved plans for the following buildings:—C. H. Goater, for A. G. Barralet, club buildings, Ringwood Road; F. Scammell, house, Chester Road; T. Heath, for S. Yeatman, house, King Crescent; H. L. Vahey, for Mrs. Reeves, house, Birchwood Road; W. Andrew, for J. Hillman, house, Mount Road; W. Andrew, five houses on new road, off Church Road East; C. H. Goater, for C. R. Welch, house, Birchwood Road; T. J. Philpotts, four houses, Douglas Road; C. H. Goater, for C. R. Welch, stabling, etc., Britannia Road; Canford Estate Office, for G. Duke, cowsheds, Hamworthy; J. Jones, addition to house, Carter's Avenue; E. E. Clarke, for J. Marsh, house, Rossmore Road; E. Pitcher, shed and store at rear of house, Uppleby Road; W. Southgate, house, Langdon Road; W. Buckley, for Mrs. Fletcher, additions to "Vallombrosa," Mount Pleasant Road; W. J. Turl, for F. R. Eyre, motor gar-

age and stabling rear of Branksome Gate, Western Road; A. W. Miller, for F. Mate, house, Marnhull Road; W. Andrew, New Road, off Church Road East; E. Norrish, additions to house, Ashley Road; F. G. Nutt, for Mr. Wood, shop front additions, Bournemouth Road.

Polesworth.—In connection with the Polesworth Sewerage Scheme, a portion of the land acquired has been sold for building purposes. Plans for 50 houses have been passed, and probably another 80 will be erected. Amended plans for the sewerage scheme were necessitated by this development, and the Atherstone R.D.C. agreed to apply for sanction to borrow an extra £500, making the total amount to be borrowed £6,500.

Pontypool.—Mr. J. C. Hanbury has given £2,000 to the hospital for a new wing to be erected in memory of his son.

Rastrick.—About £460 has been collected towards the cost of a new church to replace the mission church of St. John, which was demolished some years ago in anticipation of the site being required by the Lancashire and Yorkshire Railway Co.

Rochester, Kent.—The Town Council have approved plans for the following: House, Mount Road, Borstal, St. Margaret, for Mr. H. A. Saward; house, Cliffe Road, Strood Intra, for the trustees of the Wesleyan Church; stable and van shed, Old Foundry Wharf, Chatham, Rochester, for the trustees of St. Bartholomew's Hospital; house, Goddington Road, Strood Intra, for Mr. G. A. Martin; class room, King's School House. St. Margaret, for the Governors of the school.

Skye.—Sir Donald Currie has offered to erect and equip the proposed McKinnon Memorial Hospital at his own expense, and also give an annual subscription to it. This generous offer will enable the capital already collected to be used as an endowment fund.

Slateford, Longstone.—A meeting of the Slateford citizens has been held to consider the provision of a public hall. A committee has been appointed to make arrangements for procuring funds and to purchase a suitable site.

South Bank.—The U.D.C. are considering the question of erecting a town hall, for which the surveyor is to get out an estimate, preparatory to inviting architects to submit designs.

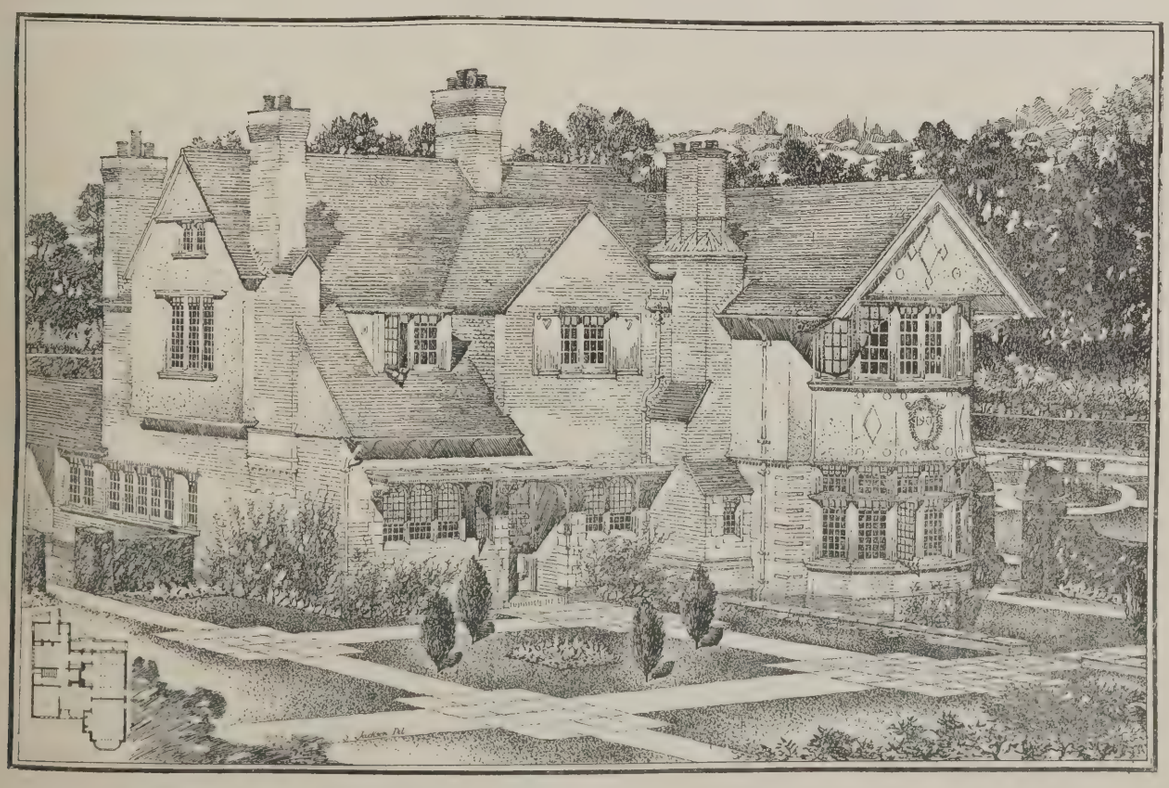
Sugley.—The Local Government Board has held an enquiry at Lemington into the application of the Northumberland County Council to borrow £6,830 for a new public elementary school at Sugley.

Sunderland.—The scheme for the new parish church of St. Gabriel is being actively put forward. The vicar has already raised between £5,000 and £6,000.

Swansea.—It is proposed to build a drill hall, at a cost of £20,000, for the Territorial forces. Negotiations are in progress with the Corporation for a site.

Swansea.—The Housing Committee have applied to the L.G.B. for a loan of £24,000 for working class houses.

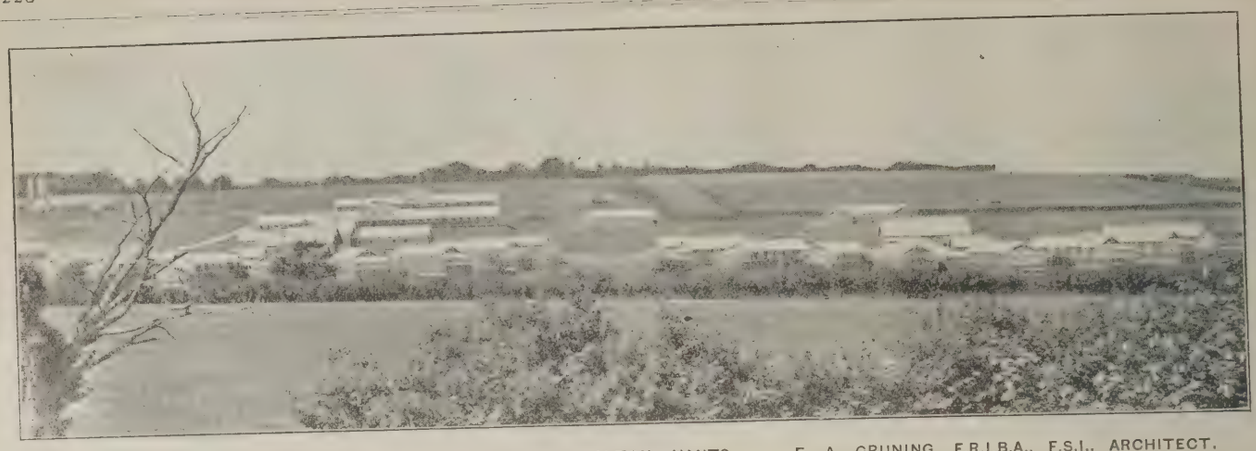
Swansea.—The widening of Castle Street will be commenced almost immediately. The Corporation have been negotiating for the last 20 years for the necessary property, which has now all been secured.



Thirsk.—The District Council have agreed to buy a site for the infectious diseases hospital at a cost of £260.

Willington Quay.—The District Council has approved plans for the following:—Three houses in Armstrong Road and Carlyle Street, and two houses in Station Road, for Mr. C. D. Smith; house and shop in Western Road, for Mr. MacLaren.

Woking.—The U.D. Council have approved plans for the following:—Major Wreford Brown, detached house, Bagshot Road, Bridley; Miss D. Bristowe, detached house, Bagshot Road, Bridley; E. Nisbet, detached house, Heath House Lane, Bridley; H. A. Waters, pair of cottages, Boundary Road; E. J. Waters, pair of cottages, The Avenue, Church Street; L. S. Hart, pair of villas, Kingsway; C. C. Colborne, detached house, Blackbridge Road; G. Tipping, motor garage, Star Hill, Messrs. Scrivens, additional room at the rear of house, High Street, Knaphill; Rev. J. M. Harris, re-erection of existing Mission church, Connaught Road, Brookwood, on a new site; Mrs. Allan, alterations and additions to The Hollies, Upper St. John's Road; Lady Northcliffe, additional room at The Firs, Prey Heath Road; G. Statham, detached cotage, White Rose Lane.



Worthing.—The Local Government Board have given formal sanction to the borrowing of £2,520, and £80, for the purposes of the Christ Church Council schools alterations, and £480 for the erection of an iron building to serve as a temporary school.

York.—The City Education Committee have recommended to the City Council that the tender of Messrs. Wm. Airey and Son, of Leeds, amounting to £10,524, be accepted for the erection of the Municipal School for Girls.

PROPOSED HOUSE AT CHINGFORD, ESSEX. S. JACKSON, ARCHITECT.

This house was designed to be erected adjoining Epping Forest, Chingford, but the client for whom it was designed having bought a house in the vicinity, the project has been abandoned. The materials proposed were sandfaced bricks for the walls generally, rough-cast, finished white, to portions of the upper floors, and the roofs covered with Westmorland slates. Woodwork generally to be painted white.

LORD MAYOR TRELOAR CRIPPLES' HOME AND COLLEGE, ALTON, HANTS. E. A. GRUNING, F.R.I.B.A., F.S.I., ARCHITECT.

Buildings in Progress and Completed.

Devonport.—The new Hippodrome, from the designs of Mr. Bertie Crewe, of London, has been opened. Messrs. J. Parkinson and Sons, of Blackpool, were the contractors.

Ebbw Vale.—A workmen's hall for the Ebbw Vale district of the Miners' Federation has been erected at a cost of £5,000. The hall consists internally of three floors, viz., ground floor and two galleries, one above the other. The principal entrance opens into a crush-hall, and access to the gallery floor is obtained by a broad flight of granolithic steps. The floors are fireproof throughout. Accommodation is provided for about 1,000, fixed seats being provided in the galleries and chairs on the ground floor. The proscenium has a framed up arch, and jambs ornamented with Tyne Castle decorations. The stage is provided with a portable raising gallery. Behind the stage ante-rooms are provided with miners' agent offices above. These rooms are divisible by patent sliding partitions. The lighting is electric, with gas in case of emergency. The heating is low pressure, and the ventilating on the natural system. Ample exits are provided, which enable the building to be cleared in a short time. Mr. H. Waters, of Ebbw Vale and Beaufort, is the architect, and Mr. David Morgan, of Beaufort, the contractor.

Evenwood, Yorks.—A new Wesleyan Sunday School is being erected at a cost of £800.

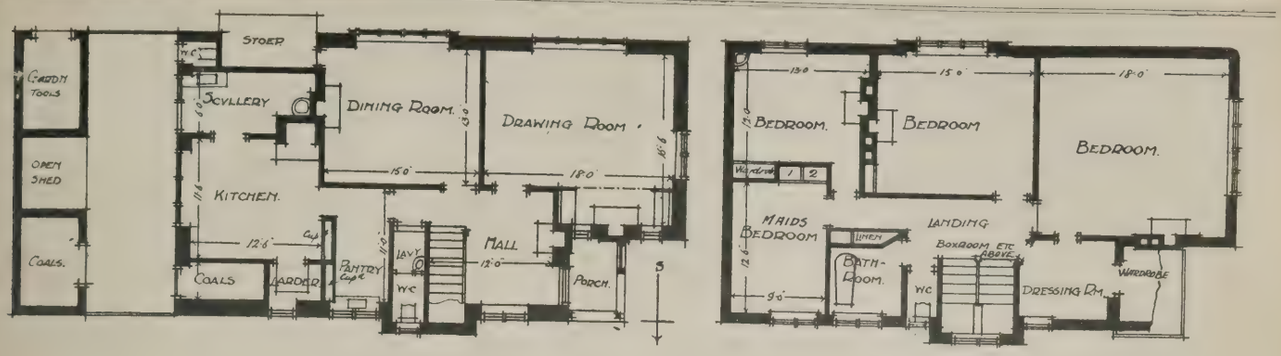
Greatham, Yorks.—A new tower to the ancient church of St. John the Baptist is being erected at a cost of £1,550.

London: Bethnal Green.—Rapid progress is being made with the first block of workmen's dwellings, erected under the will of the late Mr. W. R. Sutton, the well-known carrier, who left nearly £2,000,000 for the provision of houses for the poor. The block in question, situated in James Street, has cost about £40,000, in addition to £11,000 paid for the site, and the dwellings are intended for people with a maximum wage of 25s. a week. The number, size, and rental of the dwellings will be:—4 of four rooms. 10s. a week; 66 of three rooms, 7s. 6d. a week; 66 of two rooms, 5s. (average): 24 one rooms, 2s. 6d. a week. Each flat will have a roomy kitchen attached, and every bedroom a permanent wardrobe, while every tenant will have a private bathroom and bath. By pulling a lever it will be possible to transfer the fire from the kitchen through an iron shutter into the stove of the sitting-room. On the completion of the James Street dwellings, a similar block will in all probability be erected on a site already purchased in the City Road, and further buildings may eventually be put up in large provincial towns.

London, W.C.—The new stage at Drury Lane Theatre, to replace that burnt out in the spring, has now been completed. It is 100 ft. wide, 100 ft. deep, and 100 ft. high, nearly half as large again as the old one. The floor has used up 10,000 square ft. of teak from Burmah. The new roof is 20 ft. higher than its predecessor, and is constructed of steel trusses 10 ft. high and 90ft. long, fixed by some 5,000 rivets. A glass roof surmounting the "grid" avoids the necessity of artificial light for the day work. An improved electric lighting installation gives an illumination equal to 150,000 candle-power. It uses up three miles of steel tubing and eighteen miles of wires and cables. Immediately behind a new fireproof curtain is a water sprinkler, which in the event of fire automatically discharges a continuous stream on the back of the curtain to keep it cool. Fly galleries, from which the scenery is worked, have a total length of 250 ft., and are constructed of steel. The limelight galleries are nearly 200 ft. long. The cost has been £20,000.

Milford Haven.—A dwelling-house and extensive premises for Mr. C. C. Morley are being erected by Messrs. Hayward and Worcester, of Bath, who are also building the new post office here.

Newport (Mon.).—The contract for the construction of the new tunnel on the Great Western Railway, on the Cardiff side of Newport Station, has been let to Messrs. C. J. Wills and Co., of Westminster, and the firm propose starting operations immediately. The tunnel, which will be three-quarters of a mile long, will duplicate the existing tunnel, which contains two sets of running lines, and will, therefore, double the accommodation for the increasing traffic, not only on the main line between Cardiff and Newport, but also to and from the Western Valleys now teeming with new collieries. The approach works have been carried out by the railway company and by Messrs. McKay and Davies, contractors. The work is expected to take two years to complete.



Perth.—For the new city hall, to cost about £29,000, the following tenders have been accepted by the Town Council:—Mason work, R. Brand and Sons, Perth; steel and iron work, Bladen and Co., Glasgow; joiner, D. S. and J. Anderson, Perth; plumber, McLeish and Co., Perth plasterer, John Sharp, Perth; glazier, G. R. Douglas and Son, Perth; electric lighting, A. Westwood and Son, Perth; heating and ventilating (Plenum system), Ashwell and Nesbitt, Glasgow.

Scarborough.—St. Mary's schools have been reconstructed, and a new playground added at a cost of £1,400.

Sheffield.—The new Victoria Wesleyan Mission Hall in Norfolk Street is rapidly approaching completion, and will be one of the largest buildings in the city, giving accommodation for 2,000 people. Tip-up chair seats have been provided, with accommodation for hats under and receptacle at the back for books, etc. The platform will accommodate a choir of 250 people, and the top tiers of the choir seats being on a level with the balcony, the choir accommodation can, if necessary, be extended by an overflow into that part of the hall. The hall is top-lighted, and has also side windows. In addition to the main meeting-hall are seventy other rooms, comprising class-rooms, offices gymnasia, two or three lecture halls, a club for young women, and tea-rooms The heating accommodation throughou is on the low-pressure hot water system supplemented with hot air pipes. In th public hall and corridor the illuminan will be electricity, but in the class-rooms etc., incandescent gas will be used. Th tower will be used in ventilating the build ing, and extracting fans have been in stalled. The total cost of the building including a plot of land of the value o £6,000, which has been given by Mr Thomas Cole, is £41,000.

Swallownest.—A new Baptist chapel accommodating 350 people, has bee erected at a cost of £950. The buildin is of red brick with brown stone facing in a freely treated Gothic design. Th floor is of mosaic, the windows hav leaded lights, and the furniture and fi tings are of pitch-pine. The heating on the low-pressure hot-water system. M J. W. Winter, of Handsworth, is th architect.

Tamworth.—A new reredos in alaba ter was unveiled on August 30th in S John's R.C. Church. The work w executed by Messrs. Jones and Willis, Birmingham, and the silver plate a brass-work in connection with the rered was carried out by Messrs. Hardman a Powell, also of Birmingham.

THE COTTAGE, BULSTRODE WAY, GERRARD'S CROSS. FAIR AND MYER, ARCHITECTS. *(See centre plate.)*

Correspondence.

Out of Work Architects.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—How can we prosper when those who keep us off the land go untaxed? The materials we use (bricks, mortar, wood, etc.) are taxed to the utmost. Who finds work for architects? Do the dukes who hold the land? Not much! We have to beg of them to sell or lease. If they paid anything like their share of the common burden, they would beg of us to come and buy. This isn't socialism. ANOTHER ARCHITECT.

[The desire to tax land values is based on the belief that there is a large unearned increment from the land, which should bear its due share of taxation. That is a political qestion for which our columns are not open to discussion. But it is coupled with another belief, that the taxation of the land would bring great areas into the market for building purposes; and it might possibly have this effect in cities and urban areas. We can assure our correspondent that we have lived in a district in Essex where the landlords had themselves to farm practically all their land because nobody wanted it, and because even Scots farmers could not, rent free, make a living on it. And our correspondent also forgets that nearly all our cities and towns are over-built—that in London we have, on a recent estimate, 50,000 empty houses, and the fact, mentioned in this issue, that warehouses are a "drug on the market." Need we point out again that nine-tenths of the house property erected is built without the intervention of an architect. So far as the dukes are concerned, they have a good record for employing architects to design the buildings they erect.—Editor B.J.]

To the Editor of THE BUILDERS' JOURNAL.

SIR,—*Re* your articles on the "Architects' Distress Question," may I make a suggestion? Why should not some building paper call together an architects' union of the United Kingdom? This union would be outside the R.I.B.A., but nevertheless would not be antagonistic to it. All who joined would agree to the following clauses:—

1. To keep to the R.I.B.A. standard of fees.
2. To accept no situation as official architect to any public body or town council unless paid the R.I.B.A. fees on all work done.
3. Not to directly advertise his profession either in papers or by notices or works. The union would have to issue these regulations and seal agreements with members, and this, being done by a small central body, could be effected economically, and the expenses of a union should be very small. I think that nearly all architects would join such a call to arms, and the union would be a success in relieving our distress somewhat by preventing the undercutting of fees, by stopping the appointment of official architects, and by ensuring that all large works would be open to competition. To be a member of this union only a small fee need be paid—about one or two shillings. All members would be bound to pay a penalty to the union if found breaking these rules, architects being encouraged to keep watch on each other and report any transgression. Yours, "U.I.S."

[This is the first practical suggestion to hand; but the machinery required is already available in the R.I.B.A.. It is unfortunate that our correspondent can only suggest the formation of another body to spur the R.I.B.A. on to a proper sense of its duties. The first essential of such a scheme is union amongst the architects themselves, and, as we show, in our second article on "The Architectural Profession to-day," this important factor is lacking.—Editor B.J.]

Lighting Rooms.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The interesting suggestion of M. Augustin Rey, published in your last issue, for alterations in rooms to secure better lighting, can hardly be regarded as absolutely novel, as large windows with splayed reveals and deep white coved friezes are not quite unknown to English architects. The figures given would be of greater value if one knew what is the criterion by which M. Rey decides that daylight illumination is good, medium, or bad. The daylight illumination at any point in a room is simply a proportion of the outside uninterrupted illumination from the sky. It may interest your readers to know that, whatever this proportion may be for any given conditions of window space, glass, obscured horizon, etc., it is practically constant from sunrise to sunset from June to December, except when direct sunlight is entering the room or is directly reflected into it. This proportion

A SHOP-FRONT IN WESTMINSTER. C. H. B. QUENNELL, F.R.I.B.A., ARCHITECT.

can be easily and rapidly measured, and has been obtained for a considerable number of buildings and schools. It can be as easily measured in models as in actual rooms. M. Rey's suggestion that the window should reach from floor to ceiling is, I fear, based upon a mistaken view of the relative values of different parts of window walls for lighting purposes. The space immediately below the ceiling is of very great value, but the space near the floor is practically useless. In a very ordinary town situation lowering the top of the window from 12ins. below the ceiling to 24ins. in a room 10ft. high, would reduce the daylight illumination by, roughly, 50 per cent. I have never measured the actual difference caused by different depths of white frieze, coved or vertical, with wall-papers having average co-efficients of reflection, but the probability is that M. Rey's results were due not so much to the coving of the white frieze as to its depth, and more especially to making the top of the window flush with the ceiling. It would be interesting to know whether M. Rey measured the sky brightness on both occasions, or merely judged it with the eye. This is decidedly important, as a slight cloudiness, by diffusing the sun's rays, will more than double the illumination received by a room.

London, W.C. PERCY WALDRAM.

Relations Between Architects and Insurance Surveyors.

To the Editor of THE BUILDERS' JOURNAL.

Sir,—The writer of the article in your issue of August 26th, headed "The late Mr. James Sheppard," with a secondary title, "The Relations between Architects and Insurance Surveyors," seems to be rather prejudiced against the latter body of men.

I do not know, but possibly he may have had an unfortunate experience; but, at any rate, I think some of the surveyors of the fire offices could cite instances of equally unsatisfactory treatment at the hands of architects.

The majority of architects consider that the question of fire insurance does not come under their purview in any way, and many of the remainder never suggest to their clients the desirability of a conference between all three parties. They are, I am afraid, too often enamoured with some pet schemes or systems of their own, to give any consideration to any practical suggestions that could be willingly offered by an insurance surveyor if he only had the opportunity.

Another reason for the apparent want of interest on the part of the insurance surveyors is that they often do not know anything of the proposed new buildings until they are actually erected and much of the plant is installed, whilst this omission could be easily remedied if the architect would but bear in mind the desirablity of the above-mentioned conference. Such a conference, were it held, would also help to obviate the annovance which is felt by the owner of the property when the insurance surveyor suggests some slight structural alteration, or the re-arrangement of the laying out of some of the plant, by which means there might be a material reduction in the fire-insurance premium; as not only the architect's plans, but the whole of the proposed internal arrangements, could have been fully discussed before any operations had been commenced.

Yours truly,
AUDI ALTERAM PARTEM.

Notes and News.

The "Stock" prize for designs for architectural decoration, offered by the Royal Society of Arts for competition among students of schools of art in the United Kingdom, has been awarded to Frederick Sydney Smith, of the School of Art, West Bromwich, for a design for the decoration of a church interior. The prize consists of the Society's gold medal or a sum of £20.

* * *

"Queen Elizabeth's House," otherwise Ivy Lodge, Brixton Hill, which has just been demolished to make room for new buildings, was interesting chiefly from its age, and from the legend (probably false) that it had been used by Queen Elizabeth. Apparently it was of later date, and as it presented no very striking features, it will not be greatly missed.

* * *

A proposed Leeds Corporation loan of £55,000 for gasworks purposes is being strongly opposed. At an inquiry held on Wednesday week, on behalf of the Local Government Board, it was stated that in a judgment that had been delivered by one of the High Court judges with reference to borrowing powers, it had been held that all overdrafts at the bank were really borrowing powers, and the Leeds Corporation had no right to have an overdraft at the bank, unless the Local Government Board granted them powers to borrow the amount overdrawn. Mr. Joseph Dransfield, who raised objection, said that the rates of the city were 9s. in the pound, and he prophesied that seven years hence they would be 11s. 6d.

* * *

A discovery of importance for the history of Umbrian architecture has just been made beneath the cathedral of Citta della Pieve, the building which contains some of Perugino's masterpieces. On a wall being removed, a crypt, supported by nine columns, has come to light, and it is supposed that this chamber was a portion of the original cathedral.

* * *

The water-supply of Paris is regarded as being unsatisfactory, both as to quantity and quality, and there is an agitation in favour of a large and comprehensive scheme to meet modern requirements. The most striking of several proposals that have been made is to draw the supply from the Lake of Geneva.

* * *

The inartistic and unsuitable buildings which disfigure the countryside are due, Mr. Delissa Joseph declares, in a letter published in a recent issue of the "Times," not to the want of men capable of designing the right kind of building for its situation, or capable of using the right materials, but to the fact that the larger proportion of buildings are erected without the intervention of the architects. The character of the foundations of a building, the strength and union of materials, the air spaces surrounding buildings, their sanitary appointments, he points out, are all controlled by local authority; but the questions of design and amenity are entirely uncontrolled, except in the case of the great estates. The remedy for this, he thinks, is in the establishment of a Ministry of Fine Arts, which, with local committees of taste, should control the design of buildings, in the same way as the more utilitarian circumstances of building are already controlled. This will necessitate the employment of the talent of the hundreds of capable architects who could bring their powers of design and their knowledge of the suitable use of materials into the service of beautifying and preserving the countryside; and he believes that it is only by the establishment of a system of public control of the design of buildings, either by a Ministry of Fine Arts or by some other suitable official machinery, that we can hope to ensure a cessation of the present distressing disfigurement of the country.

* * *

A discovery of two bas-reliefs, representing a couple of Byzantine crosses, with a Roman inscription of the third century, has been made by the workmen engaged in the restoration of the cathedral at Ancona.

* * *

An interesting discovery at Exeter Cathedral, parts of which are now undergoing repair, seems to point to the existence of an earlier building on the same site. Through a crack in the south tower, workmen have extracted a carved head, which is said to be of Egyptian origin. Some time between the eleventh and fifteenth centuries the head was used, with other rubble, for the purposes of filling up. The Norman towers, commenced in the eleventh century, are usually spoken of as the most ancient portion of the cathedral.

* * *

The consolidation and amendment of local Acts is recommended in the special report of the Select Committee of the House of Commons; and it is further advised that certain common terms, such as "new street," and "common lodging house," be defined by statute, as their local interpretation could only lead to confusion and divergence in practice.

* * *

The slate quarries at Corris, near Machynlleth, Montgomeryshire, are about to be reopened; Lord Herbert Vane-Tempest having announced that he has signed the lease of the quarry, and that he hopes to see it in full working order very soon.

* * *

Wolverhampton Model Housing Exhibition, which was opened on Saturday last by Sir Oliver Lodge, has for its object "to encourage the building of well-designed, economical, and durable houses, suitable for erection in the suburbs of towns in the Midlands, and to provide architects and builders with an opportunity of showing the best methods of construction in a definite and practical way; to demonstrate the advantages of more systematic development of new building areas in the suburbs of large towns; and to provide examples of the best furniture for workmen's homes, and of the best building materials suitable for improving the construction and conveniences of small houses." The site is on the Fallings Park Estate, which is owned by Sir R. A. S. Paget. Twenty-two architects and builders will be represented in the competitive classes, and fifty-one houses will be completed, costing from £150 to £300 each, while about twenty additional houses will be in course of erection.

* * *

Coventry's new water supply, which was turned on by the Mayor of Coventry on Thursday last, is conveyed from Whitacre reservoir to Coventry by a main that is nearly twelve miles long. The cost has been about £50,000.

The 33rd annual report of the Public Works Loan Board, which has just been issued, shows that the Commissioners during the financial year 1907-8 made 883 advances for sums amounting to £2,116,060, as compared with 906 advances for £2,123,496 in 1906-7. A sum of £1,994,838 was advanced on the security of local rates, and £121,222 on that of property. The rates of interest receivable averaged £3 11s. 6d. per cent., as against £3 13s. 7d. per cent. in 1906-7. The various advances, under their several classifications, were:—Allotment Acts, England, £3,510; Education Acts, England, £748,147; Scotland, £243,708; Poor Law Acts, England, £28,151; Scotland, £1,000; Public Health Acts, England, £847,788; Scotland, £56,195; Small Dwellings Acquisition Act, England, £12,862; Small Holdings Act, England, £4,436; Welsh Intermediate Education Act, £4,044; local authorities under other Acts, England, £18,677; Scotland, £26,320; canals, etc., England, £9,000; Harbours, etc., Act, 1861, England, £24,940; Scotland, £15,000; Housing of the Working Classes Acts, England, £51,010; Scotland, £7,000; Military Lands Acts, England, £12,792; Scotland, £1,480.

* * *

Northampton Polytechnic Institute, St. John Street, London, E.C., re-opens its evening classes on Monday, September 28th, and its day classes on Monday, October 5th. From the bulky syllabus sent to us for notice, it appears that there is a strong building trades section, in which instruction is available for building trades students generally, designers of buildings, carpenters and joiners, stonemasons, plumbers, bricklayers, and shopfitters and show case-makers. There are also classes in structural engineering, electrical engineering, and surveying and levelling; and there is also an artistic crafts department.

* * *

Ventilation by piston-action for the New York subway is proposed by Mr. Bion J. Arnold, consulting engineer to the Public Service Commission, who found that, in summer, the temperature of the subway is some six degrees higher than that of the street. As constructed, the subway, for the most part, is a wide enclosed roadway, with no segregation or partition of tracks. Its two south and two north tracks have four sets of trains constantly in movement, and a large proportion of the energy used in driving these fast-following trains is transformed into heat. Mr. Arnold recommends the building of a solid, continuous wall (preferably, for economy, of terra-cotta) between the north and south express tracks, except where the subway runs into single tube construction. The aim sought is ventilation by piston action as through a cylinder. The system was first adopted on the London electric railways.

* * *

A model colliery village is being attempted near Doncaster, where two new mines are at work, while a third is being sunk. In order to house the miners, Mr. A. B. Markham, M.P., chairman of the Brodsworth Main Colliery Company, has created a model village, in which 620 houses are being built on 127 acres of well-wooded land. The houses are described as being of "mediæval style," and some of them have been set back or brought forward from the general line, in order to avoid the destruction of "spreading sycamores of fifty or sixty years' growth." Lawns, hedges, and rose-trees, and a sufficient variation in the design of the houses, make a very charming ensemble. Libraries, clubs, and public baths form important features of the scheme.

* * *

A new system of building hospitals and dwelling houses was suggested in an interesting paper read at the recent International Congress of Hygiene, held in Berlin, by Dr. D. Sarason, of that city. His object has been to so construct these buildings that the air may have free circulation, and that there should be no obstruction to the entrance of light. His plan, as elaborated in the paper referred to, is to build a series of terraced dwellings, so to speak, one over the other. The lowest of these reaches furthest out, and the topmost extends for only about one-third the distance of the one situated on the ground. Such a system, a writer in the "Medical Times" supposes to be well suited for sanatoria, and also for dwelling houses. Entire streets, and even districts of a town, might with advantage be constructed according to this system. It also lends itself well to decorative and architectural embellishments. The great objection from the builder's point of view to this system, which, by the way, is not quite original, is that much more space is necessary to house a given number of persons on the terrace system than on the ordinary method of building in blocks.

* * *

Attention may be called to the fact that Messrs. Thos. Parsons and Sons are making a special offer to send their book, "Specifications for Decorators' Work," by F. Scott-Mitchell, free to any architect who fills in the coupon printed in their advertisement last week. It may be remembered that in our issue of August 26th, on p. 151, in a notice of this book, we expressed the opinion that "architects will be glad to have this book, which, so far as we can see, affords excellent guidance as to choice of methods and materials in decorators' work."

* * *

The Associated Portland Cement Manufacturers (1900), Ltd., show, in the report to be submitted to the ninth ordinary general meeting of the company, to be held at Winchester House, Old Broad Street, E.C., on September 25th, that the company's profits for the past twelve months amount to £353,485 5s. 1d., and it is claimed that "this result must be considered satisfactory, if regard be had to the industrial depression which has seriously affected constructional enterprise all over the world." The directors recommend that £25,000 be carried to the general reserve and depreciation account, bringing it up to £170,000. Lord Hillingdon having retired in consequence of continual ill-health from the office of joint trustee for the debenture stock-holders, his brother, the Hon. Algernon Mills, of Messrs. Glyn, Mills, Currie and Co., has consented to take his place.

* * *

An extensive canal scheme for Somerset and Devon is under consideration. Some such scheme, which then aimed at connecting Bristol and Exeter by canal, was propounded many years ago, but nothing came of it. It is now proposed, as the first step towards the realisation of the revived and revised project, to develop the Exeter Canal, which is the oldest ship canal in the kingdom.

The proposed memorial to Cowper at Olney seems hardly likely to materialise. About £2,500 is needed, and although the newspapers of the United Kingdom, the Colonies, and America, have given wide publicity to the scheme, the committee received only £3 in subscriptions.

* * *

Criticising the Housing and Town Planning Bill, Mr. F. G. Holmes, borough surveyor, Govan, speaking at the Scottish Sanitary Congress, on September 3rd, argued that the town planning portion of the Bill did not go far enough. It ought to apply, he said, to all land suitable for building. One of the principal points to consider in a Town Planning Bill was the proper width to be adopted for new roads. This Bill gives no lead on this point, and the width prescribed in the Police Acts is inadequate. Such a width should be adopted as would ensure that the expensive street widening schemes rendered necessary in many of the larger cities owing to the mistakes of past generations must not be repeated. Mr. Holmes would like to see the Bill withdrawn.

Law Case.

Water Fittings Test Case.

At Kingston, on August 28th, Mr. P. Nesbit, of Cadogan Road, Surbiton, was sued by the Metropolitan Water Board for failing to comply with the requirements of the Board with regard to water fittings at his premises. Other residents in Surbiton were similarly summoned, sixteen summonses altogether having been issued. Mr. H. Courthope-Munroe, who appeared in support of the summonses, said that in this matter the Water Board was in a difficulty. The Surbiton Urban District Council had exercised their statutory power under the Water Act of 1871, and demanded a constant supply of water for Surbiton. The Water Board was willing to grant Surbiton a constant supply, but by the same Act it was bound to insist that certain regulations with regard to the water fittings on the consumers' premises should be complied with before a constant supply was given. Notices had been sent out requiring the introduction of new fittings in houses where they were required, but though the Surbiton people appeared to be anxious to have a constant supply, they were not in a hurry to bring their premises into consonance with the regulations. There were 3,500 premises in Surbiton, and when an inspection was made to see whether the fittings precedent to a constant supply were satisfactory, it was found that only 1,100 were right and 2,400 were wrong. Mr. Patrick Shaw, on behalf of Mr. Nesbit, raised an objection to the summons on the ground that the regulations did not apply to Surbiton until 1897 and that many of the fittings, being on the premises before, were prescribed fittings under the Act of 1871. The Bench, however, overruled the objection. Evidence was then called as to the character of the fittings on the defendant's premises, and in three of the five summonses the Bench imposed a nominal fine of 1s., and ordered the regulation to be complied with. The chairman (Sir Charles Scotter) said the Bench would give the defendant every possible facility for appealing against the decision. A similar decision was given against another householder. The summonses against the other defendants were withdrawn.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible.
The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.
The querist's name and address must always be given, not necessarily for publication.

Repairs to Church Properties.

BANBURY. — DILAPIDATIONS writes: "Will you inform us as to the procedure adopted with respect to dilapidations and repairs to church properties, when occasioned by the living becoming vacant, through death or other causes, showing what control is exercised over same by the incoming and outgoing clergyman, and also by the diocesan surveyor. Also who pays for the repairs, and who gives orders for same to be carried out?"

The proceedings are as follows: As soon as the living becomes vacant a "direction to survey" is sent to the diocesan surveyor, who then inspects the buildings and reports to the Bishop what repairs are required, and gives an estimate of their value. A copy of this report and estimate is sent to both the outgoing and incoming incumbents. One month is allowed for appeal, and at the expiration of that time, or sooner if agreed by the representatives of the outgoing and incoming incumbents, the Bishop makes an order, the amount of this order then becomes a debt due from the outgoing to incoming clergyman. As soon as the money is received by the new vicar it is his duty to pay the amount to the Governors of Queen Anne's Bounty, and to get the dilapidations put right, and Queen Anne's Bounty pay the amount to the builder who does the work, upon the certificate of the diocesan surveyor, countersigned by the Bishop. E.M.

Reinforced Concrete Equation.

DUBLIN.—J. M. writes: Would you kindly explain in the next issue of your journal how the figures $\frac{4\times 20{\cdot}25}{4}$ have been arrived at in the following example, taken from "Manual of Reinforced Concrete," by Marsh and Dunne, page 105: A column 12in. square, 30ft. high, with fixed ends reinforced with 1⅛in. diameter rods near each corner. Centre of rods 3in. from outside column

$$P_1=\frac{100{,}000}{1+\frac{900\times 144}{4\times 84{\cdot}6\times 100\left(\frac{144}{12}\times\frac{4\times 20{\cdot}25}{4}\right)}}$$

from the formula:—

$$P_1'=\frac{P}{1+\frac{k^2\,l_1^2}{84{\cdot}6\times 10^2(r_c^2+r_s^2)}}$$

where P = safe load calculated as a short column in lbs.; P = safe load on long column in lbs.; l = length of column in ins.; r_c = radius of gyration of the concrete assumed as being of total sectional area of the column; r_s = radius of gyration of reinforcement; k = a co-efficient for a rectangular column with least side b_1 $r_c^2=\frac{b^2}{12}$

The values of $r_s^2=\frac{\Sigma 7^2}{n}$.

The equation on p. 105 of the manual should be:—

$$P_1=\frac{100{,}000}{1+\frac{900\times 144}{4\times 84{\cdot}6\times 100\left(\frac{144}{12}+\frac{4\times 20{\cdot}25}{4}\right)}}$$

the 4, owing to a printer's error, has been changed into a X. The further reduction is correct.

C. F. MARSH.

Stress Calculations.

KINLOCHLEVEN.—QUERY writes asking for more detailed explanation of the manner in which the thrusts and moments were found in the answer to the query on the above subject on July 8th, 1908.

Fig. 1 shows the frame diagram for the roof truss, with the loads on it. The horizontal thrust H must be such that when it is combined with the resultant vertical force at A, the resultant will be in direction AB. Resultant vertical force at A = 67 —16.75 = 50cwt. nearly, and by the triangle of forces since the pitch is 45°, H also carries 50 cwt.

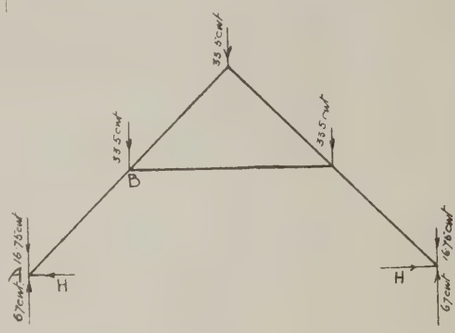


FIG. 1.

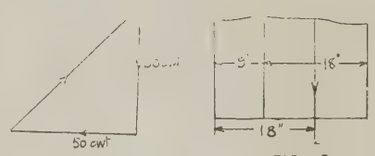

FIG. 2.

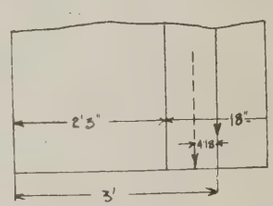

FIG. 3.

The moments of stability are obtained as follows:—Fig. 2 shows the proposed section. The weight of wall and pier is 313cwt., and the vertical force transmitted by the truss is 67cwt., giving a total of 380cwt. Taking this as acting, roughly, down the centre of the wall, the distance from the edge is 18in. In the reply on July 8th this was given by error as 13½in., the width of the pier having been taken instead of the thickness, and a printer's error occurs in the last line of the second column, which should read "truss is equal to $\frac{134}{2}$=67 cwt., so that," etc. ∴Moment of stability = 380 × 18 cwt. in = $\frac{380\times 1}{12}$ ft. cwt. = 570cwt. about.

Fig. 3 shows the section suggested in the reply of July 8th. As therein stated, we have roughly moment of stability = 432 x 3 = 1,296 cwt. ft. If we wish to work more accurately, we find the centroid of the combined wall and buttress by moments, and take the weight as acting there, as shown dotted in Fig. 3. In the section shown in Fig. 2 the centroid will be nearly at the centre of the wall, but in Fig. 3 it is about 4.18in. from it. Therefore, working with this corrected position, the moment of stability becomes $\frac{432\times 31{\cdot}82}{12}$ = 1,150 ft., cwt. The 4·18in. is obtained as follows:—Take moments round the centre line of wall. Moment = 89 × (13·5+9) + (432—80) × 0 = 80 × 22·5.

∴If x is the distance of the centroid from this centre line 432 x = 80 × 22·5

$\therefore x=\frac{8\times 22{\cdot}5}{432}$ = 4·18 nearly.

Waterproofing a Brick Wall.

LONDON.—A. O. C. writes: Can you recommend me any materials, patent or otherwise, to paint on a brick wall and waterproof same externally; names of makers of any such materials would be useful; also is Beaumontique mentioned in Specification No. 11, page 385, clause 11, obtainable ready-made, and if so from whom?

There are several excellent waterproof preparations useful for the purpose. One of the best is called Blundell's Petrifying Liquid, and is manufactured by Messrs. Blundell, Spence, and Co., Ltd., Hull, and 9, Upper Thames Street, E.C. If it is desired to retain the appearance of the brick, the transparent variety is used; but if a coloured effect is wished for, a special paint is used on the undercoats, and the transparent liquid is used for the finish. Any colour may be employed, from rich reds to white, and the effect is very similar to that of ordinary glazed tiles. You should send for a small specimen brick coated with the material. Another speciality which may be recommended for the same purpose is Browning's Colourless Preservative, made by the Indestructible Paint Co., 31, Cannon Street, E.C. This is the solution which was used for preservative purposes on Cleopatra's Needle. The same firm make a preservative enamel paint. Still another useful material is "Stone Liquid," made by Szerelmey and Co., Rotherhithe New Road, S.E. Although specially prepared for use on stone, it is equally effective when applied to brick. There is also the Damp Preventive, made by Messrs. C. Chancellor and Co., of 13, Clerkenwell Road, E.C. We do not know whether "Beaumontique" is supplied ready-made, but we should think not, as it would harden too quickly; and if any material were added to prevent this, the virtues of the mastic—for that is what it is—would be lost. The recipe in "specification" gives "two of white lead, half of litharge, and four of boiled oil mixed round," so all you have to do is to go to the nearest oil and colour shop and tell them to mix you up white lead and litharge in the proportions of 4 to 1, and then break up in boiled oil and reduce until of the consistency of thick cream. Use the same day the mixture is made, or you will have trouble. J..

Payment for Extras.

CHAPEL-ALLERTON.—HABYBEE writes: In the case of a London contractor having a contract in a provincial town, and who has secured the contract in competition with local firms, would he be entitled to charge the London standard rate for extras and daywork?

No; unless there be an accompanying schedule of prices for extras appended to the contract, the contractor would be entitled to extra payment according to the prices current in the district in which the work is being executed. Of course, it is possible that there may be some very special work necessitating the employment of expert workmen who cannot be obtained locally, and the question must then, naturally, be dealt with on its merits!

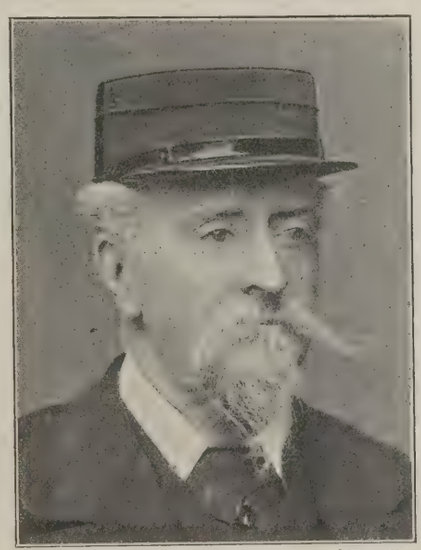
F. S. I.

FIRE-RESISTING CONSTRUCTION SECTION.

(MONTHLY.)

SIR EYRE MASSEY SHAW AND FIRE PREVENTION.

The death of Sir Eyre Massey Shaw marks the end of the career of the best-known advocate of fire protection the world has yet seen, for although the deceased fire chief retired from active work as far back as 1891, his thirty years of fire service duty stands even to-day as a most remarkable achievement in the fire protective service of the world. Fire appliances in different parts of the world may or may not to-day be equal to those of the metropolis; and in some respects such appliances may even be in advance of what we have in London; but one thing remains undisputed, and that is that Sir Eyre Massey Shaw's brigade of 1870 was simply miles in advance of anything to be found at that period in Europe or in America.



The same position of the London force may be said to have existed in 1880—perhaps even in 1885—but very approximately from that date several foreign countries learnt what was being done in London, and gradually made headway, and by the time of Sir Eyre Massey Shaw's resignation several had probably made such progress as to equal London work in certain directions.

Sir Eyre Massey Shaw's original work, of course, dates back to nearly 50 years ago, and the fire engine establishment, as he knew it first in 1861, was simply an insurance office brigade comprising some thirteen fire stations with 113 firemen. When he left it in 1891 it already had 59 fire stations and 706 men. To-day, of course, the force is a much stronger one even than that. The development of the London Brigade during the 30 years of Sir Eyre Massey Shaw's service was quite remarkable, for it was always undermanned for the amount of work that had to be done and the extraordinary area that had to be covered. It was also a single-handed brigade, inasmuch as the deceased fire chief was the only officer to direct its policy and work, while to-day there are five superior officers in the brigade, apart from the professional men connected with the electrical and engineering work of the brigade. Nevertheless, Sir Eyre Massey Shaw found time to do a considerable amount of research work, enquiry, and writing, and his views, as expressed in evidence before various Select Committees of the House of Commons, and his writings must even to-day rank as useful views often quite applicable to modern conditions.

Such writings of his as the records of the London Fire Brigade Establishment, his book on Fire Service, his summary on the estimating of the "risk" of buildings, writings such as his on "Fires in Theatres," and that standard work entitled "Fire Protection," must even to-day rank as reference books of the first order, and they cover not only matters of fire protection as generally understood at the period when they were written, but frequently matters appertaining to fire prevention in its most modern sense.

Sir Eyre Massey Shaw was a strong writer, and yet a happy one in style and absence of undue verbosity, and his arguments were always soundly put and carefully though-out, so that even if the deductions were subject to argument, all concerned realised that he never put statements to a paper without the most careful consideration.

As Sir Eyre Massey Shaw's views of the past will always remain an important feature in things appertaining to fire protection we think it may not be out of place to present some of his views on matters which will perhaps lead to a better appreciation not only of his work, but of the basis upon which the Fire Preventive Organisation of this country has been built.

The Late Sir Eyre Massey Shaw.

FIRE PREVENTION AND BUILDING DEFECTS.

We should like to give some of his views taken from his books, entitled "Fire and Fire Brigades" (1884), on matters of fire prevention which indicate that at an early date he fully realised the peculiarities of this country and of London in particular. As far as fire prevention was concerned, some of these paragraphs read as follows:

Building Defects in England.

"The defects which can be found in the construction of buildings in this country are well known by those whose duty it is to witness the effect produced by fires, explosions, and catastrophes of a similar kind. During recent years many of the regulations for the construction of buildings have been carefully revised, and the result of these revisions has been to produce better buildings; but very great improvements are yet required in our building laws in order to bring them up to anything like the French, German, or American standards."

Number of Staircases.

"It is impossible to enumerate here the many evils referred to, but space must be found to enter a protest against the too common practice of constructing buildings such as institutions, schools, factories, etc., with only one staircase for the accommodation of their large number of occupants. The fact of having only a single means of escape, in the case of a panic alone, would lead to a serious if not fatal accident, and if a fire should break out on the lower levels in proximity to the staircase, the result would be most disastrous, as the only mode of exit would be altogether cut off. All such places as these should most certainly be furnished at each end of the building with a staircase giving access to the various levels."

Cheap Construction.

"No matter how stringently the clauses of a Building Act may be drawn or however vigilantly its enactments may be enforced, if immoderate cheapness of constructed is permitted, there will always be found ways to infringe the provisions of the law."

Danger of Calling for Tenders for Buildings.

The system of inviting builders by means of advertisement to offer tenders for the construction of buildings is one very generally resorted to at the present time, and it has its advantages from certain points of view. When a judicious selection of the persons allowed to tender is made, the specifications and drawings, carefully prepared by professional persons whose theoretical and practical knowledge of the subject is thoroughly sound, the material used all of proper description, and the execution of the work carried on with a minute attention to all the details under the supervision of a skilful and honest clerk of works, no evil consequences could result; but this combination, so necessary for the perfect construction of a building, is not always to be found.

Tendering by unqualified persons is neither more nor less than a competition among builders as to who will work at the cheapest rate; and, unfortunately, it is too often the means of bringing forward ignorant, unscrupulous men, to the exclusion of those of honour and intelligence. Scamping is resorted to, either to increase the builders' gain or to save them from positive loss, as probably the price at which they have contracted to carry out the works is insufficient to enable them to supply good material and proper skilled labour.

Therefore, taking soundness of construction as the true basis and fundamental principle on which the reduction of losses by fire depends, the system of contracting with builders, whose only recommendation is that they will carry out the work at the lowest cost, is certainly not calculated to attain the desired end.

This branch of the subject is of paramount importance to all persons engaged in commerce, and is of the deepest interest to those whose lot it is to be practically employed in extinguishing fires.

While there are many points on which firemen may probably differ, this is one concerning which all those who have had any experience will be found to be absolutely unanimous.

Similarly we quote from other of his handbooks of 30 years back as follows:—

Fire-resisting Structures.

To construct a building in such a way that it will resist the effects of heat and flame for any considerable time—for that

is all that can be done—there are required care and forethought in the choice of the position, a sound knowledge of the several materials to be used, and a skilful design to bring these materials into combination in such a way as to meet the proposed requirements of the structure when completed, and at the same time to avoid the consequences of the extreme changes of temperature, for it should be known that some of the greatest destruction ever seen after a conflagration, has been caused, not by the primary, but by the secondary effects of fire—that is to say, not by the expansion produced by heat, but by sudden contraction after the expansion.

The necessary limits of this essay prevent a full discussion of all the numerous details involved in the choice of a position, including the consideration not only of the site proper, but also of the kindred subjects of foundation, area, configuration, and many others. We shall, therefore, pass on to the subject of choice of materials, in which there is much food for reflection in connection with safety of buildings when exposed to sudden changes of temperature.

Walls.

In walls, bricks of any kind, but more particularly fire-bricks, if properly laid in sound mortar or cement, will resist the effects of heat for a very considerable time; stone, if laid as well in the middle as on the inner and outer surfaces, lasts a long time, unless it fails in the unsupported parts over the openings, which it always does when the lintels and the tops of the windows are made of the same materials.

Brick Arches Over Doors and Windows.

Openings for doors and windows in a stone wall, to be safe, should be mounted on the top with brick arches, which would carry the load without any difficulty long after stone in such a position would have become calcined, and probably allowed the whole of the superstructure to fall down.

Danger of Stone Stairs.

For stairs stone is a very dangerous material, unless it is embedded on some substance which can carry it when it gets hot. Stone stairs are usually made by tailing in the ends of a number of blocks of stone a few inches into a wall, leaving some two or three feet protruding and hanging unsupported in mid-air. After such stairs have been completed, they present an imposing appearance of solidity and strength, and so deceive the eye; but where is the man who would willingly trust his life to one such step if fixed alone at a height of 30 or 40ft. above the ground? Even at the ordinary temperature of the atmosphere, the block would then be somewhat fragile, but there can be no doubt that any sudden rise of temperature—such, for instance, as might be produced by pouring a kettle of boiling water on it—would suffice to bring it to the ground. In this case the exposed part would expand with the heat; the supported part, being protected, would not expand, and a fracture would occur between the two, generally close to the wall.

Responsibility of Builders.

It is earnestly to be hoped that the time is approaching when the constructors and owners of buildings destined to carry large quantities of heavy goods will recognise their responsibility to warn the occupiers, and those who labour under them, of all dangers which are inseparable from the use of such materials and form of construction as are adopted, and not attempt after a disaster to screen themselves under the plea, which may sometimes be used, but never with real fairness, that the building did not yield to the effects of fire.

Danger from Expansion.

Even where walls are made of sound, well-burned bricks laid in best cement, what is their use, if some material inside, on the application of heat, fractures them or removes them altogether at the very moment when they are most required to stand firm? They are only as the findings of the supposed ship, which may or may not be very good in themselves, but get no opportunity of being fairly tested.

"Fireproof" and "Heat-proof."

It must be strongly asserted that before a building can be fireproof it must first be heat-proof, and that no building with any exposed metal forming an essential part of its construction can be truthfully so designated.

Use of Stone and Iron for Building Purposes.

And now it may be asked, Whether it is proposed that these dangerous materials, stone and iron, should never again be allowed in buildings? but the answer is distinctly in the negative. Nothing of the kind is proposed, or even ever so remotely suggested. The requirements of the time in which we live involve a necessity for the use of these materials; these requirements must be met, and no one with any pretence to being called practical can venture to ignore them.

Architect to Explain to Owner.

What is proposed is simply this: that those charged with the construction of buildings should thoroughly explain the facts of the case to their employers in words incapable of being misunderstood.

It would be no particular humiliation to an architect or builder to have to inform his client that he has been obliged, for economy, for convenience, or for whatever other satisfactory reason he may wish to assign, to use stone and iron in the construction of the building; that these materials look well, and afford many advantages for the transaction of business; that they may probably last a long time, and in the end prove very economical; but that there are inseparable from their use two dangers which should be ever present to the occupier's mind, and which should be guarded against in every possible way, the one frequent in occurrence, but generally moderate in extent, the other happily rare in occurrence, but, when it does occur, in the last degree serious, and sometimes altogether overwhelming.

Exaggeration of Advertisers and other Interested Persons.

To give an imaginary, perhaps not altogether imaginary, instance of what is commonly done in this way: let an inventor be supposed to have discovered that a good wash of alum or of tungstate of soda dissolved in water will render wood and other substance uninflammable. He at once advertises it as making the material incombustible; a trial is carried out by skilful persons; the materials are consumed by fire; and the so-called invention is turned into ridicule; whereas, if he had only claimed for it what it could really do, or perhaps, to put the case in other terms, if he had only known the meaning of the words he used, and limited his assertions to the same truth, he might have made a great success.

Chemicals so Used, Whether they Produce Decay.

There is another matter connected with the use of chemicals in this way which is worthy of attention, *i.e.*, the probability of their causing decay to the materials, and on this point different opinions prevail. Some say that chemicals bring on rot—chiefly dry rot—others say that they prevent rot. Both are equally violent in the expression of their views, and in fact, like such persons, talk a great deal of unpractical jargon and semi-scientific nonsense. It may be stated, though not very positively, that so far as present experience goes, chemicals used in this way have no effect whatever either in producing or preventing decay.

Ceilings.

In this country ceilings are made to look solid enough, and if they were only what they represent themselves to be, they would in most cases be almost impervious to the effects of either heat or flame; but let them be pierced through, and they are found to be a sham, being a mere skin of plaster adhering to some thin strips of wood, which may be termed indifferently laths or firewood, according to the taste of the observer. These strips are tacked on to the lower parts of the joists, and the spaces between them and the flooring-boards over the joists are simply so many flues, commonly containing only very foul and noxious air, but capable at any moment of being converted into most dangerous hidden passages for smoke and flame. Air passages are also found in the lath-and-plaster partitions between rooms, behind the skirting boards of rooms, and under the steps and behind the skirting boards of stairs. All this is wrong in every way; it may be called by any name people choose, as such appears to be the custom of our time; but it is at best a gross deception, and the sooner it ceases to exist the better.

Shams and Scamping in Buildings.

All sound building is more or less good building for resisting the effects of heat, as a neighbouring country shows us by examples worthy of being studied by those interested in the subject; and all scamping is dangerous, as unhappily our own country and many others are constantly showing us by examples equally striking, and still more worthy of our serious study.

Truthful Descriptions.

It is earnestly to be desired that, as far as our buildings are concerned, there may be no more shams in either things or words. Poisons no doubt are useful, but we do not commonly label them as food, and put them into the hands of persons who cannot possibly know their qualities. Whether it is a less offence to hand over a building to a person necessarily ignorant of the quality of materials and the art of construction, and not only to withhold all information concerning the acknowledged dangers, but even to go further and lull him into a false sense of security by informing him, without any reference to the all-important question of the stock which it is to contain, that the structure is safe from the effects of heat, it must be left to the reader to judge.

The Expression "Fireproof" Without Qualification.

To conclude this subject as it began, it is once more asserted that the ordinary use of the expression "fireproof," without qualification, is wrong in the extreme, and should be discouraged by all alike whether interested only in the true meaning of our words, in the dictates of common-sense and prudence, in the true economy of the commercial interest of our country, or in all these points combined.

Men may use the term heedlessly or lightly, and perhaps when so using it they

may do but little injury; but this is all that can be said, for when they come to use it seriously, they cannot deny that, as far as concerns the true meaning of the words composing it, they help to deceive or mislead those unacquainted with the subject, encouraging in their minds a sense of security which has no real foundation, by attributing the quality of being proof against the effects of fire to buildings which are not certain to be able to resist even the effects of heat without the contact of fire.

This is plain speaking, but it is necessary for some one to speak plainly, when thousands of lives and millions of money are in constant unnecessary peril through the careless, erroneous, deceitful, or false application of such a term as fireproof.

THEATRE SAFETY.

On the matter of theatre safety, Sir Eyre Massey Shaw wrote, 30 years back, as follows, and here, again, nearly every word has bearing in the provinces to-day:—

The subject of preventing the sudden destruction of theatres by fire is one which must necessarily force itself on the attention of all who inhabit crowded cities, and especially of those entrusted with the protection of helpless masses of persons on the occasion of such catastrophes; but the expediency of directing public attention to it may possibly be called into question, and on this point it may be well to say a short preliminary word.

It must be acknowledged that there are many people in the world who would rather not be made acquainted with the dangers that surround them, and whose natural nervousness is such, that a warning against danger may sometimes have as serious an effect on them as the danger itself; and, if there is one class of men which, more than any other, has a constant opportunity of observing this kind of feeling, it probably is a fireman. If, therefore, no good were likely to result from giving a warning about theatres, it might be as well, at least for me, to refrain from doing so; but, on the other hand, it is to be said that, if a fireman is silent, and no one else knows how to speak, or no one considers it his business to speak, or perhaps no one cares or dares to speak, a sense of insecurity, which may be often latent but is never altogether absent, may go on continually increasing, until, at any moment, it may take the shape of panic, and cause disastrous consequences.

This point was carefully and anxiously considered before I ventured to publish the following remarks in the "Practical Magazine," a short time since; but the spirit in which my papers were received and commented on has, I think, fully justified the course which, with great diffidence and not without a strong sense of responsibility, I felt it to be my duty to take.

The feeling of nervousness caused by a knowledge of risk is one wholly senseless and worthless; it can never by any possibility do good, and may do harm; but it exists, and has to be acknowledged, as it is here, and allowance must be made for it. This is all very well in its way; but if a serious accident were to happen, and a man professing to have special knowledge were to come forward afterwards, and say he could have pointed out means by which it would have been averted, and that he was prevented doing so by his fear of causing excitement in the minds of nervous persons, how would the world judge such a man? How would he judge himself?

I have carefully and laboriously studied the subject of protecting theatres from sudden destruction by fire; I think I know every source of danger that exists or can exist in such places, and I am strongly convinced that, with proper construction, judicious management, and sound precautions, there would be no danger for the audience, and very little for the building, and this is my reason for writing on the subject.

I am quite aware that it is not my special business to interfere in such a matter as this, but I am not aware, nor do I believe that any one else is aware whose business it is, or whether it is the business of any one; and, in this state of utter vagueness and ignorance, I think it better to say what I have to say, and to send it forth for what it is worth, than to withhold it now and have to state it afterwards, perhaps on the occasion of some great catastrophe.

I have never met a manager in this or any other country in which it has been my fate to travel, who did not impress me with a sense of his anxiety to do everything in his power for the safety of his audience, and I know of many efforts in this direction, and much expense incurred in making them; but I can call to mind very few instances in which the arrangements have been really methodical or satisfactory, and our own country presents a humiliating example of the entire absence of any system of method whatever.

At the great opening an effectual protection could be obtained by means of a metal curtain, which could be dropped at a moment's notice. The metal curtain should be supported and worked by steel or iron chains. Such curtains, it is true, have before now been tried, and have not found favour with managers of theatres, but that does not at all affect the subject under consideration. They may have been badly made, badly fitted, or badly worked; but, even so, it must be obvious that, in the event of a fire happening, they would have done *some* good.

At all events, in the present condition of mechanical skill and knowledge, it is simply monstrous to say that the thing is impossible, and it is quite certain that there are thousands of the first engineers of this and other countries who would not hesitate to accept an order for such a curtain, and, if not hampered by restrictions, would guarantee that fire would not get through or by it under any circumstances whatever in less than an hour or so, which is much more time than would be required for saving first the audience, and afterwards the auditorium and other parts of the building.

THE TERM FIREPROOF.

Concerning So-called "Fireproof" Buildings.

The fire chief's bugbear was the term "fireproof," and in some later writings he again says as follows:—

So little attention appears to have been paid to the real meaning of the term "fireproof" that it seems necessary, notwithstanding the repeated practical warnings which great calamities by fire have given during the last quarter of a century in all parts of the world, to endeavour to impress on those interested the incontrovertible fact that, in treating of fireproof structures, distinct reference should be made not only to the style, material, and capacity of the building itself, but also, and in a much greater degree, to the nature, quantity, and classification of its contents. These points are inextricably mixed up together, and no amount of legislation can separate them; on the contrary, there is abundant evidence to show that much evil has been done by the ordinary use of the expression "fireproof," which is commonly applied to the structure alone, thus utterly ignoring the obvious fact that, with regard to risk of fire, the contents of a building are of much greater importance than the building itself. Thus, a building, which would be perfectly fireproof as an office or private dwelling-house, might be most dangerous if converted into a factory or warehouse. It may be laid down as a rule that a building, to be truly fireproof, should be divided into compartments, and so constructed that the contents of any one compartment might be consumed by fire, without calcining, melting, or otherwise destroying the surrounding horizontal and upright positions, and, therefore, without communicating fire to the other rooms or floors.

SIR EYRE MASSEY SHAW'S INDIVIDUALITY.

Lastly, we must understand the individutlity of this great fire veteran, and for this purpose we quote his general views, as expressed in his book on "Fire Protection" in 1876:—

I first studied the practical details of the appliances used in extinguishing fires, and with this very small stock of special information, and such mechanical and scientific knowledge as remained to me from a University career, I entered on the duties. At first a habitude of dealing with men, and a knowledge of the principles and practice of organisation, coming after a management deficient in these particulars, brought some credit, and when, in difficult or important cases, a success occurred, there was the usual kind and quantity of commendation which a public servant doing his best is pretty sure always to receive. Many and great were the congratulations, and very highly were they prized, but after the lapse of so many years I may now frankly acknowledge that some of the most painful humiliations of my life were undergone at that very period. I could not but accept expressions of kindness as they were offered, yet I felt they were but half deserved. None knew as I did how very nearly the great successes had been great disasters. Even as I write these lines, I can recall distinctly to my recollection cases in which I had all but sacrificed the whole of my little band in the attempt to do what was almost impossible, and only corrected the error at the exact critical moment when further delay would have made it irrevocable. Then would follow the explanations in form of a lecture—for even in those early days I had adopted this mode of conveying instruction—and, during the lecture, a recapitulation of the orders given and the reasons for them, particularly those which either seemed contradictory or were actually so, for, in practical work of this kind, it is often necessary to change the orders very suddenly; and by degrees there would creep out from me some kind of acknowledgment that such and such a move had been a mistake, as it involved a great risk for a small gain.

OFFICIAL FIRE TESTS IN THE UNITED STATES.

We are pleased to observe that the fire-testing operations at the Columbia University, New York City, have been re-started under the direction of Professor Woolson, in the same thorough manner as heretofore, and that the work has lately been again in the direction of testing reinforced concrete floor systems.

One of the latest floors so tested is one that has been designed on the triangular reinforced concrete floor system of the American Steel and Wire Company, and we observe that the tests have been to the international testing standard—viz., the test occupied four hours, and the average temperature was 1,700 degrees Fahr., the load, however, being only 150-lb. per square foot, whilst in England 2½-cwt. per square foot is required. The water was applied, immediately on the conclusion of the test, from the steam fire engine, as in England.

As to the results of the test, they were conclusive as to the floor being "fully" fire-resisting. Not only did neither fire nor water pass through the floor, but the deflection was comparatively small.

We observe, by the by, that the testing chambers of the Columbia University measured 14ft. by 20ft. in the clear, whilst those of the British Fire Prevention Committee measure 15ft. by 20ft. in the clear, so that the test in England is just slightly severer. On the other hand, the United States tests end with a final load up to 600lb. per foot super. applied after the termination of the test, whilst this additional loading after test does not take place in London. There are certainly some points in favour of this additional load, but it is a requirement over and above that of the universal standards, and we think that the universal standards are sufficiently severe.

The reinforcement of the floor tested, we should add, is a triangular wire mesh, there being longtitudinal members which are laced up with metal wire arranged triangular in plan.

INTERNATIONAL CO-OPERATION AND FIRE PROTECTION.

The annual meeting of the International Fire Service Council took place at Luxemburg at the end of last month, when there was an attendance of some fifty delegates from the different countries represented on that Council, the countries so represented having an aggregate of more than 2,500 firemen.

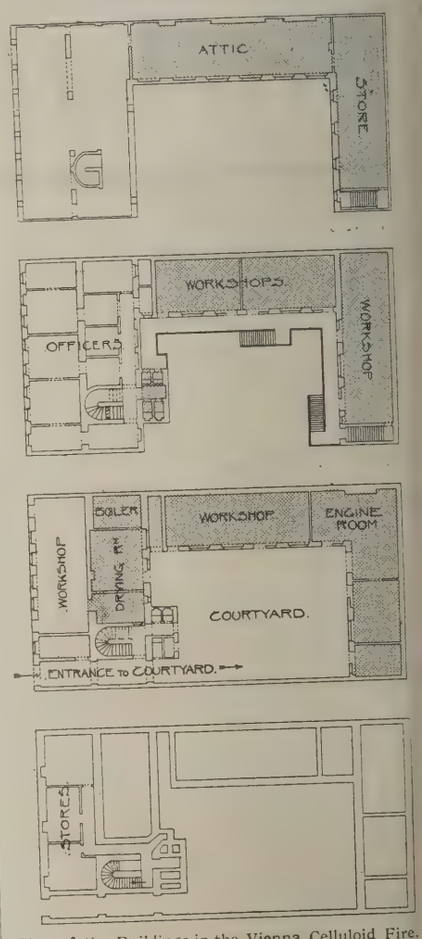
We have to record a successful meeting, which was chiefly devoted to business, and inlcuded the election of officers. So far as England is concerned, of the fifteen available seats on the executive committee, three have been filled as follows—Mr Edwin O. Sachs (chairman of the British Fire Prevention Committee), as vice-president; Mr. Horace Folker (vice-president of the National Fire Brigades Union), as a member of the executive; and Mr. Ellis Marsland (hon. sec. of the Society of Architects) as hon. deputy secretary.

The president of the council for the year will be the chief officer of the Amerstam Fire Brigade—Mr. Meyer—a Royal Engineer officer, and of considerable technical standing, and his influence, it may be anticipated, will be in the direction of encouraging fire brigades to take an interest in fire prevention.

It was particularly noticeable at this meeting that the modern tendency is for the post of professional fire brigade officer to be filled by civil engineers, architects, or surveyors, and, to a limited extent, also by Royal Engineers. In the volunteer fire service, the appointments seem to be held more and more by borough architects, borough surveyors, or local architects in private practice. All this speaks well for the increase of fire preventive measures; nad it is interesting to note that the rank and file of the volunteer fire service is also now being mainly recruited from the building and engineering trades.

It is gratifying to observe that under the new rules of the Fire Service Council, means are made available for assisting in research work, publication of papers on technical subjects, and the like.

A CELLULOID FIRE AT VIENNA.

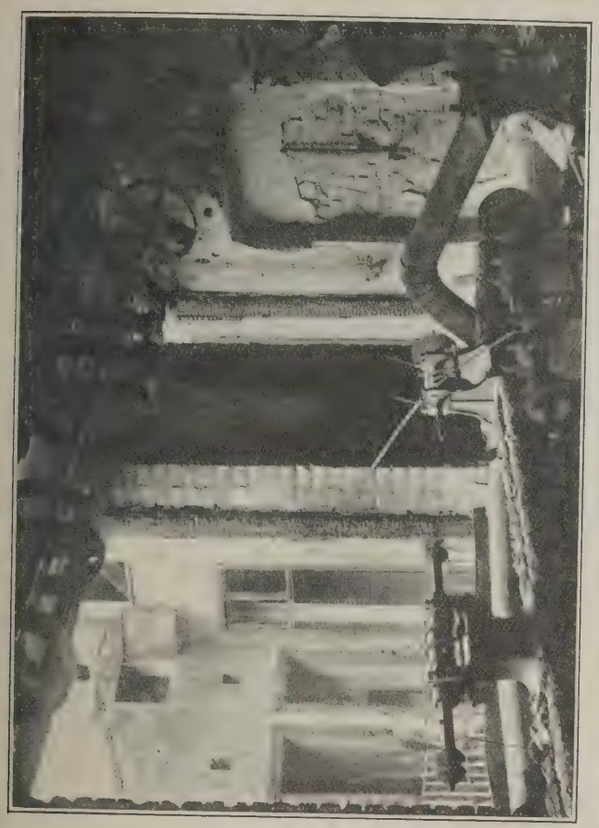


The celluloid fire that took place at Vienna at the celluloid factory of Messrs. Sailer, and resulted in seventeen deaths and a large number of injured, was a remarkable instance of the rapidity with which the fumes of celluloid suffocate human beings, and also afforded an instance of how small quantities will explode with considerable force.

The fire is also remarkable as an instance of the local regulations, which are comprehensive ones regarding the precautionary measures as to celluloid, not being acted upon.

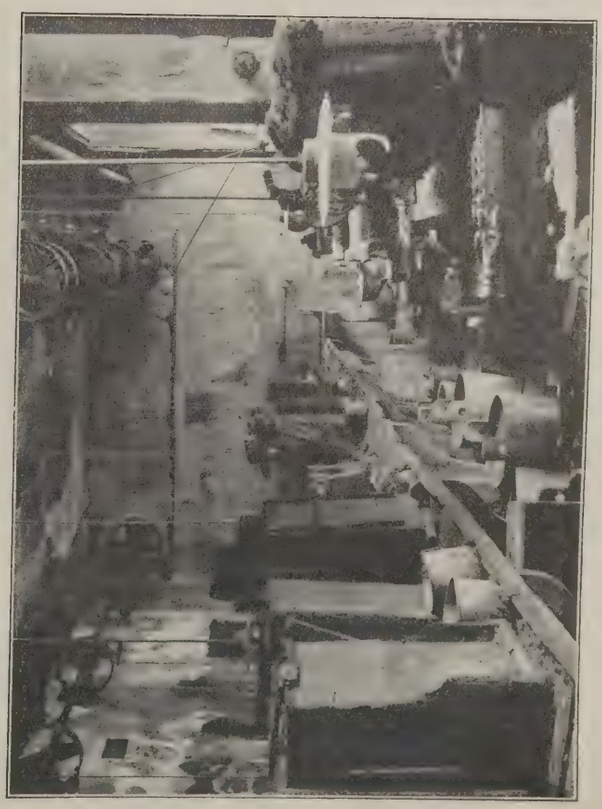
We present five photographs of the fire, and also plan of the building, and these together give some indication of the character of the fire and the nature of the building.

When the fire brigade arrived they found that the workshops on the ground floor and the first floor of the left wing were alight. There could be no question of life-saving operations, as all in the building at the actual time of the arrival of the brigade must have been dead. It was further impossible to work close to the building, owing to the density of the fumes and the celluloid smoke which filled the court yard and prevented active work. The direct cause of the fire was not ascertained.



The character of the construction of the building, which was eminently unsatisfactory, can be seen from the illustrations.

Plan of the Buildings in the Vienna Celluloid Fire.



CELLULOID FIRE AT VIENNA: GENERAL VIEW OF THE BUILDING.

THE CELLULOID FIRE AT VIENNA.

THE CUBICAL CONTENTS OF BUILDINGS.

The New Amendments to the London Building Act.

The General Powers Bill of the London County Council, which has just obtained Royal Assent, contains the important amendments to the Building Acts which we anticipated some time back, and whilst fully at one with the promoters as to the necessity of changing the Building Act of 1894, we regret that so serious a measure should have found a place on the Statute Book without receiving that serious consideration it demanded—and which it would have had had it not been put forward in such a hole-and-corner fashion in a "General Powers Bill."

We give the full text of the new clauses as below, and surmise that it now lies with the officers of the County Council, and the Building Acts Committee of the County Council in particular, to either allow or disallow buildings of large cubical extent, according to their discretion.

In other words, in accordance with the policy of the party in power, and in accordance with either any feeling of security or any feeling of panic, buildings will be allowed or disallowed, as the case may be, and thus building owners, who apply for permits after a long period of absence of fires, will probably do better than those applying immediately after some great catastrophe. Whatever the decision may be, too—rightly or wrongly—there also does not appear to be any power of appeal to the tribunal of appeal.

Certain discretionary powers should, of course, be allowed to the County Council as such, but we are very pleased to observe that there is at least that safeguard—that both the Chief Officer of the Fire Brigade and the Superintending Architect will, respectively, have to advise the County Council on the cubic extent question, and that thus the personal responsibility will rest with them morally, if not legally, in case of any loss of life arising from undue leniency on their part.

The Act is most specific on this point—*i.e.*, that the Council must be satisfied, on the report of the Superintending Architect and of the Chief Officer of the Fire Brigade, that the additional *cubic extent is necessary* for any such building, *and that proper arrangements have been made, or will be made and maintained,* for lessening as far as practicable the danger from fire. We trust the two officers in question fully realise what this responsibility means, and that it is a responsibility not only as to structure, but as to the arrangements for the maintenance of the precautionary measures in the building.

On points of principle outside that of cubic extent, the new Act now recognises the horizontal division as a fire division. It is only to be hoped that in recognising the horizontal division the usual mistake will not be made of under-estimating the precautionary measures required to the supports of those horizontal divisions, such as the due protection of stancheons and columns.

The other point of principle involved in the new Act is the discretionary power given to the County Council to allow as divisional doors other doors than the recognised London County Council party wall doors, and we are glad to see that the Council now have discretionary powers as to shutters, which is a matter of importance, having regard to the great convenience of roller shutters, as compared with doors.

We can, of course, fully realise that efforts will be made to obtain the consent of the Council to all manner of possible and impossible doors, and we would here again remind those who control the matter that it will probably be the door, as the weakest feature in these buildings of large cubic extent, upon which the whole of the safety, not only of the block, but a district, may depend, and that they should be particularly warned against the wishes of the faddist, and preferably retain substantial, solid door-work (as against made-up-doors) as a *sine qua non* in these large buildings, and, further, not only to attach importance to the actual door, but to give very great care to the question of its fastenings.

As we have indicated before, we fully realise that the amendment of the Act was necessary, but we think that the form it has taken, and the vast discretionary powers left in the hands of the London County Council without any limit whatever as to cubic extent, are dangerous to a degree, both from a fire point of view, politically and economically.

We realise that a large number of premises will immediately be altered in such a manner as to benefit from the new Act; and we realise that a large number of huge buildings, particularly of the Draper type, must spring up. All this, of course, will only begin to make itself felt in a few years' time; but then there will also come a material increase in the insurance rates and block rates in districts where such premises exist; and we further believe that the fire service of the metropolis will have to be materially strengthened in those districts where buildings of this type exist, and even a new type of heavier fire-appliance introduced than has been necessary heretofore. In other words, American conditions of fire hazard will soon prevail in certain districts of the Metropolis if due care is not taken, and that leniency in matters of building regulation permitted which certain politicians practically hold out as a bait to their electors in the shopkeeping and manufacturing classes.

As we have indicated before, we think that a two million cubic feet limit would have been most advisable, and that such matters as doors should have been more clearly defined by statute. But on the other hand it is perhaps well that an experimental period should exist, for there can be no doubt that a general amendment of the Building Act can only be a matter of a few years now, when modifications will probably again find their way into the statute book.

A peculiar feature, as we have indicated, of the new clauses was the way they were brought before Parliament under a General Powers Bill. Both the professions concerned and other parties interested really only had knowledge of the clauses when it was too late to lodge petitions, or to obtain a *locus standi* in Parliament on the subject. Again, in order to obtain the enactment, the Parliamentary Committee of the L.C.C. practically had to give an *ex parte* view of the matter without calling, for instance, for the report of the chief officer of the fire brigade on the subject or allowing any of the members of the Fire Brigade Committee interested in the subject to act as witnesses, and indicate the views of the Fire Brigade Committee, for these in the main were adverse ones.

Political convenience throughout had to make way for the technical aspect of the question, and the matter being really everybody's business, and thus nobody's business, the Act was duly embodied in the statute book, and in due course the ratepayer will pay the piper in contributing towards a higher expenditure on the fire brigade, and the policy-holder in the form of higher insurance rates.

The clauses of the General Powers Act referring to the Building Act are given below.

Interpretation and effect of this part of Act.

15. Words and expressions used in this Part of this Act shall, unless the context otherwise requires, bear the meanings assigned to them in "The London Building Act, 1894" (In this Part of this Act referred to as "the principal Act") and any references in the principal Act or any existing Act amending the same to Part VI. of the principal Act or any of the provisions of that Part shall be construed as referring to such Part or Provisions as amended by this Part of this Act and the principal Act the London Building Act, 1894 (Amendment) Act, 1905, the London Building Acts (Amendment) Act, 1905, and this Part of this Act may be cited together as "the London Building Acts, 1894 to 1908.

Repeal of Sections 75, 76 and 77 of principal Act.

16. Sections 75 (Cubical extent of buildings) 76 (Consent to larger dimensions) and 77 (Rules as to uniting buildings) of the principal Act are hereby repealed, and from and after the passing of this Act the principal Act shall be read and have effect as if the following provisions of this part of this Act had been inserted in the principal Act instead of the said Sections 75, 76 and 77.

Cubical extent of buildings.

17. (1) Except as in this section provided no building of the warehouse class, and no building or part of a building used for any trade or manufacture shall extend to more than two hundred and fifty thousand cubic feet unless divided by division walls in such manner that each division of such building or part of a building as the case may be shall extend to more than two hundred and fifty thousand cubic feet and no addition shall be made to any such building, part of a building, or division so that the cubical extent of such building, part of a building, or division shall exceed two hundred and fifty thousand cubic feet.

(2) Where the Council are satisfied by the report of the Superintending Architect and of the Chief Officer of the Fire Brigade that additional cubical extent is necessary for any such building part of a building or division as aforesaid and are satisfied that proper arrangements have been or will be made and maintained for lessening so far as reasonably practicable danger from fire the Council may consent to such building part of a building, or division containing additional cubical extent but such consent shall continue in force only while such building part of a building or division is actually used for the purposes of the trade or manufacture (if any) in respect of which the consent was granted.

(3) The Council may in any case in which they think fit so to do consent that any such building or part of a building as aforesaid being divided wholly or in part horizontally by floors to be constructed in such manner and of such materials and in all other respects as the Council may require or approve and in such case such floors shall for the purposes of this section be deemed to be division walls.

(4) The provisions of this section shall not apply to any building which being at a greater distance than two miles from Saint Paul's Cathedral is used wholly for the purpose of the machinery and boilers of steam vessels or for a retort house for the manufacture of gas or for generating electricity provided that such building consist of one floor only and be constructed of brick stone iron or other incombustible material throughout and is not used for any purpose other than such as are specified in this subsection but every such building shall for the purposes of the provisions of the principal Act with respect to special buildings be deemed a building to which the general provisions of Part VI. of the principal Act are applicable.

FIRE AT A MARSEILLES WAREHOUSE.
Interesting as showing the effect of fire on a building with steel roof-trusses.

Rules as to uniting buildings.

18. (1) Buildings shall not without the consent of the Council be united unless (a) they are wholly in one occupation and (b) when so united and considered as one building they would be in conformity with the principal Act as amended by this Part of this Act and with this Part of this Act.

(2) An opening shall not be made in any division wall separating divisions of a building of the warehouse class or used for any trade or manufacture or in any party wall or in two external walls separating buildings in any case in which such divisions or buildings as the case may be if taken together would extend to more than two hundred and fifty thousand cubic feet except under the following conditions :—

(a) such opening shall have the floor jambs and head formed of brick stone iron or other incombustible materials and be closed by two wrought iron doors sliding doors or shutters each not less than one-fourth of an inch thick in the panel at a distance from each other of the full thickness of the wall fitted to grooved or rebated frames without woodwork of any kind all such doors sliding doors and shutters shall be fitted with sufficient and proper bolts or other fastenings and be capable of being opened from either side and shall have on each face thereof styles and rails at least four inches wide and one-fourth of an inch thick and shall be constructed fitted and maintained in an efficient condition. Provided that in lieu of being constructed and fitted as aforesaid such doors sliding doors and shutters may be constructed of any such fire-resisting materials and be fitted in any such manner as may be approved by the Council.

(b) Such opening shall not exceed in width seven feet or in height eight feet and the width of such opening in any wall of a storey or (or if there be more than one such opening in any such wall the width of all such openings taken together) shall not exceed one-half of the length of such wall. Provided that any such opening may be nine feet six inches in height in a wall of which the thickness is not less than twenty-four inches or if the doors sliding doors or shutters closing such opening are placed at a distance of not less than twenty-four inches from each other. Provided also that the Council may consent to any such opening being of such greater height or width as they may think fit.

(3) Whenever any buildings which have been united cease to be in one occupation the owner thereof or if the buildings are the property of different owners then each of such owners shall forthwith give notice of such change of occupation to the District Surveyor and shall cause all openings uniting the same in any party wall or in any external wall to be stopped up (unless the Council consent to such openings or any of them being retained) with brick or stone work not less than thirteen inches in thickness (except in the case of a wall eight and a half inches in thickness in which case eight and a half inches shall be sufficient) and properly bonded with such wall and any timber placed in the wall and not in conformity with the principal Act shall be removed and if notice be not given to the District Surveyor pursuant to this section such owner or each of such owners shall upon conviction in a summary manner be liable to a penalty not exceeding five pounds.

(4) Buildings shall be deemed to be united when any opening is made in the party wall or the external walls separating such buildings or when such buildings are so connected that there is access from one building to the other without passing into the open air.

(5) The provision of this section shall extend and apply

(a) to all openings at any time after the passing of this Act made or proposed to be made in any party wall or two external walls or in any division wall notwithstanding the existence in any such wall of an opening uniting buildings or affording communication between divisions of a building (as the case may be) and (b) to such buildings as if they had not previously been united.

Division walls to be subject to Provisions of principal Act relating to party walls.

19. The provisions of the principal Act with respect to party walls shall extend and apply to such division walls as are referred to in this Part of this Act. Provided that in the case of any such division wall the Council may if they think fit consent to such departure as they may consider expedient from such of the said provisions as are contained in Part VI. of and the First Schedule to the principal Act.

Copy of Plans & particulars approved by Council to be furnished to District Surveyor.

20. A copy of any plans and particulars approved by the Council under this Part of this Act shall be furnished by the Council to the District Surveyor within whose district the building to which such plans and particulars relate is situate.

Penalty for failure to comply with conditions.

21. Any person failing to comply with any term or condition imposed by the Council in giving any consent under this Part of this Act or failing to maintain in an efficient condition any doors, sliding doors, shutters, styles or rails or bolts or other fastenings as required under this Part of this Act shall be liable to a penalty not exceeding twenty pounds and to a daily penalty not exceeding the like amount.

Extending Exemption of Government Buildings.

22. Section 202 (Exemption of Government Buildings) of the principal Act shall be read and construed as if the exemption thereby conferred extended also to the provisions of the London Building Acts (Amendment) Act, 1905.

The Paris Central Telephone Exchange was burnt out on Sunday last; and on the same evening the Magasins de la Ville Saint Denis was also gutted by fire

FIRE INSURANCE AND FIRE PROTECTION.

We have before us the report of the sixth annual meeting of the Association of Professional Fire Brigade Officers, from which we observe that a paper was read by C.O. Eddington on the question of whether insurance companies should be compelled by law to contribute towards the cost of the local fire service. This is a matter that concerns a large number of borough surveyors and architects in private practice who have charge of provincial fire brigades.

At the conclusion of the paper, a resolution was unanimously passed that insurance companies should be compelled to contribute to the cost of the fire service. The resolution was framed in approximately the following words :—"That, in the opinion of this Association, insurance companies should be compelled to contribute towards the cost of the expenses incurred by municipalities in providing and maintaining efficient fire brigades, ether by way of an annual payment or on the basis of a standard scale charge when brigades render service in extinguishing fires which have occurred on properties insured by such companies; and in view of the fact that a Select Committee of the House of Commons has already reported recommending such compulsory payments, all interested local governing bodies throughout the country be requested to take united action, and urge the Government to promote legislation to give effect to the report of the committee as early as practicable.

"That a copy of this resolution be forwarded to all such local governing bodies, and that they be asked to adopt a resolution on the lines therein referred to, and to forward a copy thereof to the Home Secretary and to the Members of Parliament for their respective divisions."

We certainly hold no brief for the insurance companies, and only too well realise that in many directions they could materially improve their position by encouraging better fire prevention measures and fire service organisations, by giving substantial insurance rebates where improved conditions prevail. But, for all that, we consider the paper, the discussion, and the resolution were most extremely out-of-date, for they are the same suggestions and arguments that were put forward some thirty or forty years ago, were thrashed out at that time, and have been condemned by all economists and thinkers on matters of national and municipal finance.

We, of course, know that the arguments are popular; because the insurance companies, and their methods generally, as a rule meet with little favour from the public, and they are certainly not popular with the fire service. Nevertheless, it should be realised that any tax upon the insurance companies will simply come out of the pockets of the insured party, in the form of an increased rate; and, what is more, that the mere fact of such taxation being required will not only give the insurance companies an excuse for raising the rate to the extent of that tax, but for raising it to a greater extent, so that they may make a profit on the tax.

If the insured are to pay towards the maintenance of the fire service through the medium of their insurance premiums payable to the insurance companies, by all means let this be plainly argued out; but to maintain that the

insured party will benefit in any direction, or that the tax-payer and householder will in any way benefit by having the fire service paid indirectly through the insurance companies to which he contributes through his policy payments, is ridiculous. The ratepayer pays but a minimum amount for his fire service in the rate; he will certainly pay more for it in an enhanced insurance premium if the insurance companies have to contribute. The only reasonable argument that we have ever heard that the ratepayer should pay for his fire service through the insurance premium is—that the value of property in a small building is frequently greater than the value of the property in a large building, and that although a small rate only has to be paid on the small building, the amount of protection from fire that that small building requires is really greater than that which the large building requires, and that thus a higher payment should be made by the owner or occupier for his fire service.

We believe this is the argument that found favour in New Zealand, and resulted in a contribution from the insurance companies to the fire service; but we doubt whether the reasoning is sound, and we should prefer matters as they stand at present. Nevertheless, however, we would warn the insurance companies that their growing unpopularity in matters of rates where good fire service exists, or where good fire preventive measures have been adopted, must invariably lead to some defensive measures on the part of the general public, and to increased competition from newly formed companies, who are more generously inclined. They would, we are sure, do well to study the temper of the public at the present moment, if they do not wish eventually to be subjected to State interference and control, and to such taxation as may be deemed advisable.

We have gone to some length in this matter, for as indicated above, so many architects in private practice in the country, as well as many borough surveyors, now hold appointments as local fire chiefs.

Tests by The British Fire Prevention Committee.—We understand that two reports will shortly be issued, one dealing with the impregnation of textiles, and the other with the use of ordinary buckets and not pumps for fire-extinguishing purposes. Both reports should be of more popular interest than is possible to the technical reports dealing with constructional matter, and may therefore appeal to the ordinary man of business, to whom it will supply much valuable information. Fire-extinguishers from the United States will be shortly under test, and these will be followed by certain floor tests, and probably by another series of door tests.

* * *

The Vienna Fire Brigade publishes an extremely interesting annual report, with an appendix of nearly 60 pages dealing with the structural lessons at notable fires. This appendix is profusely illustrated, and is altogether of a most useful character. We dealt earlier in the year with a Vienna fire that was of technical interest in this country. The only additional fire in that city that we desire to mention on this occasion is one that took place in works in which celluloid was used, and where the same experience was obtained as in England as to the extreme celerity with which a celluloid fire will spread.

AMERICAN FIRE DOORS.

The question of the construction of armoured doors was before the National Fire Protection Association at their meeting in May last, and their official report, now issued, of the meeting is interesting reading.

It should be remembered that the armoured door, which is made by a large number of door-makers throughout the United States was originally an American idea—at least, we believe so—and that the insurance people were for many years strong advocates of this type of door.

Gradually however—probably in consequence of the widespread interest that the subject is commanding in Europe, and especially, perhaps, as a result of certain data that have been put before the technical professions in Great Britain—the true value of the armoured door is being investigated by American insurance companies, and it is now probable that the American Fire Office rules on the matter of armoured doors will be immediately modified, and there is every anticipation that there will be a further material amendment of the rules next year.

In the present case, the question of the forming of gases inside armoured doors was before the National Fire Protection Association, and we cannot do better than give the words of the chairman of the committee on fire protection coverings for windows and door openings, as presented in general meeting. The chairman in question is Mr. W. C. Robinson (chief engineer of the Underwriters' Laboratories, Chicago), and the Committee in question comprises about sixteen members, most of whom are insurance surveyors of leading companies, including British companies.

We give his words verbatim, as also those of the members of the Association, who made remarks on the subject.

Mr. W. C. Robinson said: Mr. President and gentlemen—The Committee on Fire Protection Coverings for window and door openings has only a verbal report to make. Owing to the fact that a special endeavour was made last year to place the rules in a condition satisfactory to all, and realising the undesirability of frequent changes, your committee has decided to recommend very few amendments this year. In fact, no criticisms of the present code have been received during the year, and we are pleased to report the adoption of the code by several of our members who had not previously given their formal approval.

There is only one proposition which we would like to lay before the Association, and that is relative to the question of providing an opening in the tin covering on the exposed side of the tin-clad fire doors. It is desired to have a definite wording of the rule inasmuch as it will come in conflict with the present Rule 7, a part of which I will read. (Reading Rule 7): "The fire-resisting value of a wood door encased in tin depends upon the exclusion of oxygen from the wood, thereby retarding or preventing combustion. To obtain this result, the covering must be so applied that during exposure to fire it will present the greatest possible resistance to bulging or opening up at the seams."

That is true in a measure (referring to resistance at the seams under exposure to fire), but any standard fire door, as now made under these rules, if severely exposed will open at the seams, this being due to bulging caused by pressure of the gas generated from the wood. About six months ago the Committee on Devices and Materials instructed the Laboratories to make tests to determine whether or not it would be of benefit to install a reasonably large opening on the exposed side of the door. A report of the result of these tests was rendered at a meeting of the Committee on Devices and Materials and referred to this committee. We are not prepared to recommend the exact wording, but I may state we are in favour of this change, and would suggest that it be opened to discussion here so that the matter may be thoroughly understood. In the minds of very many it is a radical departure actually to cut an opening in the door covering to release the gas. It is contrary to the specification in the present rules. We recommend that a 3-in. opening be placed in the tin covering on the exposed side of the fire door, built in accordance with the standard, for a reasonable sized door, say forty or fifty square feet. Over this hole a tin plate should be soldered to keep out the moisture, using ordinary tinner's solder. The solder will melt in case of fire, and the tin plate will fall off. In order to make the proposition clearer, I will read the conclusions in the report to the Committee on Devices and Materials. (Reading.) (a) A single vent hole of proper size at the middle of the tin covering on the exposed side of a standard fire door is advisable for the following reasons: (1) The larger proportion of the gas generated from the wood core is allowed to escape and burn at the least objectionable point, and the rupture of the joints between the plates and the formation of objectionable openings is prevented. (2) The bulging of the plates is practically eliminated, as no material gas pressure can accumulate on the inside of the door. The joints remain close to the door, and do not tend to unfold. (3) The tendency of the door to warp and curl away from the wall when exposed to severe fire is greatly reduced by the elimination of the bulging in the covering. Note.—The bulging introduces strains at the edges of the door, which tend to cause the door to curl. (4) The absence of bulging permits the door to remain in closer contact with the wall or frame at the edges. (5) The charcoal, when the wood core is reduced, is held more securely in position when no material bulging occurs in the covering. Note.—The 2-in. nails used in applying the covering extend into the core from each side of the door, and act to hold the charcoal in position. Chafing strips bolted through fire doors also aid materially in holding the covering in position when the doors are exposed to severe fire.

(b) A 3-in. hole through the tin covering at the middle of the exposed side of a standard fire door of moderate size affords sufficient vent for the gases generated from the wood core when the door is exposed to severe fire. Note.—The diameter of 3-ins. for the vent hole was selected arbitrarily. The observations during the test would seem to indicate that a vent of this size will serve for doors somewhat larger than forty square feet and also that larger vents can be used without detracting from the fire-retarding qualities of the door.

Mr. Hexamer: I will ask Mr. Robinson whether the hole was made in the wood or in the tin covering?

Mr. Robinson: In the tin covering.

Mr. Hexamer: Were any tests made with reference to several smaller holes rather than one large one?

Mr. Robinson: Two holes might provide circulation, which would cause the rapid combustion of the wood core.

Mr. Hexamer: I mean, numerous small holes?

Mr. Robinson: We made no tests as to that. I might call attention to the fact that the rush of gas through the opening prevents air or fire from entering. You can readily see the cooling influence of the escaping gas.

Mr. Hughes: Have you taken any notice of the effect of the fire going through this hole into the adjoining apartment?

Mr. Robinson: There is no hole in the wood core. There is simply a small disc of tin cut out. There was less damage to the wood back of the opening than on any other part of the door.

Mr. Hughes: Was any test made with a smaller sized opening?

Mr. Robinson: Openings from two to three inches in diameter were tried. I have no hesitancy in saying that a 4-in. hole in the tin covering would have no detrimental effect on the fire-retardant qualities of a fire door.

Mr. Hughes: My idea was, whether a smaller hole would accomplish the same purpose.

Mr. Robinson: We had hoped to connect a gauge to each side of the door, and make observations of gas pressures at different stages of the fire, with a view to ascertaining the size of hole necessary, but were unable to do so. I feel perfectly safe in recommending this action. If you do not provide a hole, you are going to get a hole anyway; so why not provide the kind and location of the hole you want? The committee has found that the covering on every fire door of the tin-clad variety has ruptured when severely exposed. In these cases the rupture has sometimes extended about the length of one tin plate, tearing the joints apart.

Mr. Hughes: Is provision made for the fusing point of the solder?

Mr. Robinson: Ordinary tinners' solder, which will melt at about 460 degrees, will take care of it in ample time in an ordinary fire. The rupture is always outward.

Mr. Phillips: As a matter of information I will enquire the extent of the bulging of the door of this type with the hole.

Mr. Robinson: The bulging of a 2½in. door, tin clad, 5ft. 8in. wide by 8ft. high, was not over one inch in any plate. The covering did not bulge as a whole.

Mr. Phillips: I will also enquire as to the extent of the bulging of a door of that kind without the hole.

Mr. Robinson: Under similar fire conditions the covering on a similar door exposed to approximately 2,000 degrees, would bulge about 15ins. The bulging of the covering would be about 18ins. if the chafing strips were not bolted through the door. It upsets our ideas a little: but with the hole as recommended, and the chafing strips bolted through, a properly made fire door is about as good as this type can be made.

Mr. Frederick: Mr. President, Mr. Robinson speaks of putting the hole on the exposed side of the door; suppose it is exposed equally on both sides?

Mr. Robinson: I do not know of a condition where it would be exposed equally on both sides if you adhere to the standard. Naturally, with double doors the hole would be on the side toward the room. It would perhaps not be detrimental to put it on the other side, except that it would not take care of the gas so readily.

Mr. Frederick: I can imagine conditions under which a single door might be accepted, where it would be exposed severely on one side and mildly on the other.

Mr. Robinson: Put it on the side most exposed, and it would undoubtedly take care of the other side better than with the present form of door.

Mr. Manlove: I will enquire whether, after the door has been exposed to the fire for some time, the amount of gas generated is sufficient to prevent the burning or charring of the wood back of the opening.

Mr. Robinson: Of course, we did not continue the tests to total destruction of the door. There was still a generation of gas as far as our experiments went.

The Chair: Is there any further discussion desired on this question? If not, the chairman of the committee will proceed with his report.

LONDON FIRE BRIGADE HEADQUARTERS.

The headquarters at Southwark Bridge Road are being extended and altered. The ground floor engine house is being placed on the first floor. There is a general supposition that the Fire Brigade Headquarters stands on what was one of the burying pits in the time of the Great Plague, but this is not the case, for whilst many human remains were discovered here in 1884, when the buildings were erected, and they, of course, received reverent treatment, the site was once known as the new Grotto Burial Ground—the "grotto" being the name of an adjoining pleasaunce, much frequented by the quick in its heyday. The land was bought by the authorities of St. Saviour's Parish, under Act 15, George III., a part being apportioned for a workhouse—since incorporated in the present buildings—whilst the ground appropriated for burials was consecrated by the then Bishop of Rochester, on behalf of the Bishop of Winchester, in 1788—a long time this after the awful calamity of 1665. The chief place of interment for the victims of this scourge in Southwark was in Deadman's Place, the Bunhill Fields of South London (adjoining the site of the old Globe Theatre), since incorporated in Messrs. Barclay and Perkins's Brewery.

Obituary.

Mr. George Drew, whose death at Cirencester, at the age of fifty-eight, is announced, was for many years a partner in the firm of Drew Brothers, builders, of Chalford. Among the important contracts on which he was engaged was the erection of the Bingham Free Library at Cirencester a few years ago.

Mr. Leonard Judge, who died suddenly at Hampstead on August 26th, aged twenty-six, from the after-effects of an attack of scarlet fever, was a son of Mr. Mark Judge, architect, and was himself a member of the same profession.

Mr. Leslie William Green, F.R.I.B.A., who died at Mundesley-on-Sea on August 31st, had only reached the thirty-fourth year of his age.

Mr. John William Lotherington Whitfield, architect, of Hull, died suddenly on August 22nd. He began practice on his own account on the expiry of his articles with Messrs. Brodrick, Lowther, and Clarke, of Hull. He was fifty-three years old.

Mr. Edward Hodkinson, architect, of 9, Abbey Street, Chester, died on September 14th. He was one of the best-known architects in Cheshire and North Wales, and designed many notable buildings, and was responsible for the modern portion of Saighton Grange, the residence of Mr. George Wyndham. He was a well-known member of the Chester and North Wales Archæological Society, and was for some years hon. curator and librarian of the Society.

Federation News.

In the section relating to the National Federation of Building Trades Employers of Great Britain and Ireland, on p. 213 of last week's issue the name of Mr. James Denver should have been given as secretary of the Northern Centre; and on that page and on p. 217, the heading "Tyne and Blyth District Federation" should have been omitted. Mr. John Tomlison is secretary to the Northern Centre Conciliation Board, whose proceedings were reported.

The Stockton and District Master Builders' Association made, on September 17th, a presentation to Alderman T. E. Atterby, J.P., and Mrs. Atterby, on the occasion of their recent marriage. Alderman Atterby is one of the best-known builders in the district, having been connected with the trade for about thirty years, and is one of the largest individual builders of cottage property in the town. The district of Newtown practically owes its existence to his enterprise, and by many people it is known as Atterby Town.

Master Painters' Convention at Birmingham.—The fifteenth annual convention of the National Association of Master House Painters and Decorators of England and Wales will be held in Birmingham from September 29th to October 3rd. On Monday evening, September 28th, a reception will be given by the President and Mrs. Teall at the Grand Hotel, and on the Tuesday Viscount Morpeth, M.P., will open an exhibition of decorative art and manufactures at the Bingley Hall. On this occasion the Lord Mayor will welcome the visitors to the city, and subsequently Mr. A. J. Teall will deliver his presidential address. The afternoon is to be devoted to the transaction of business, and at night the Lord Mayor and Lady Mayoress are to receive the delegates at the Council House. A breakfast and conference of presidents and secretaries of associations will take place at the Grand Hotel on the Wednesday, followed by sessional meeting and, in the evening, the annual dinner. On the Thursday evening—after the visitors have spent the day in Shakespeare's country—the annual business meeting will be held at the Grand Hotel, and Friday will be devoted to paying visits to the homes of different industries in Birmingham and to a tour of Bournville.

Trade and Craft.

"ETERNIT" ASBESTOS SHEETING.

The popularity of "Eternit" roofing tiles, to which reference has been already made in these pages, is being repeated, we are informed, in the case of "Eternit" asbestos sheeting for the lining of walls and ceilings, "Eternit" sheets, it is claimed, constituting an extremely handy form of fire-resisting material. They have been largely used at the Franco-British Exhibition, in the construction, for instance, of the New South Wales building and of the class-rooms of the British Education Department, as well as of various sections of the Scenic Railway. What is perhaps even more significant is the fact that the London County Council schools are being lined throughout with "Eternit" sheets, with the object of rendering them fireproof. We note a corridor of one of the London County Council schools that has been constructed by Mr. Wm. Harbrow at his "Eternit" Building Works, South Bermondsey, S.E. The studding is spaced at 16in. centres to dado height, and at 24in. above the dado height. The joints are covered with wood fillets, giving the building a solid finish, while the "Eternit" sheets render it impervious to flames.

The "Eternit" sheets are not only fire-resisting, but are also heat-resisting, and are adopted by H.M. Board of Works and by other public authorities for protecting steel joists and beams against fire and heat. "Eternit" sheets, it is stated, are being largely used in tropical climates, and in all parts of the United Kingdom, by Government departments, such as the Admiralty, the War Office, the Board of Education, the Prison Commissioners, the Crown Agents for the Colonies, etc., as well as by the London County Council, and other public authorities, and on the electric railways. A very great number of iron buildings that have been erected within the London area are protected against fire by lining the walls and ceiling with "Eternit" sheets, and buildings so protected receive permanent licences from the London County Council.

"Eternit" sheets secure satisfactory alignment, and, being of great strength, increase the structural stability of the buildings in which they are employed. After fixing, the sheets neither sag nor break with the vibration common to engine-rooms. They do not rot, crack, oxidise, shrink, nor crumble, and are indestructible by white ants, weavil, or other vermin, or by fire, acids, or acid fumes. The price of the sheets is moderate, and the work of fixing to studding is cheap, and can be done very rapidly. A further advantage is that premises lined with the sheets are ready for papering and occupation as soon as the sheets have been nailed to the studding. If desired, the sheets are supplied in terra-cotta or blue colour, thus dispensing with painting and papering. The manufacturers are Messrs. G. R. Speaker and Co., 29, Mincing Lane, E.C.

MESSRS. WILLIAM COOPER'S SALE.

Messrs. William Cooper, Ltd., the well-known horticultural providers, show, in an interesting catalogue of their twenty-first autumn clearance sale, a large number of attractively designed greenhouses and conservatories of various types and sizes—lean-to, span, and lantern-roofed—besides vineries, forcing-houses, and every conceivable kind of shed and shelter, large and small, from a chicken-coop to a mission church. The catalogue shows, also, every appliance and implement that the most complete and up-to-date horticulturist can require. It has an obvious interest and value for builders, and can be obtained from the firm, Old Kent Road, S.E.

Bankruptcies.

„ 23 to 27. Examples illustrating Shadows on various architectural details.

"PRACTICAL NOTES" contains a mass of valuable information which it is essential that the Architect should know to enable him to give that harmony, grace and proportion which exemplified the works of Ancient Greek and Roman Artists, many of which are still the admiration of the whole world. It is invaluable to students preparing for the examinations of the R.I.B.A., showing how to draw The Orders correctly with the smallest possible amount of work and study.

Price for Complete Work, 12/-, including Portfolio.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Sept. 25. MARAZION.—Erection of a villa at the picnic grounds, Marazion. Plans and specifications can be seen at J. A. Treglown's auction and valuation offices, Marazion. Sealed tenders must be sent to the above on or before Sept. 25.

T. Hatch, M.Inst.C.E., M.I.Mech.E., engineer-in-chief. Conditions of contract, specifications, and forms of tender may be inspected at the office of the Board, Embankment, E.C., and obtained upon a deposit of £1, in respect of each institution. Separate tenders, addressed as noted on the forms, must be delivered at the office of the Board, not later than 10 a.m. on Sept. 30.

PLUMBING & SANITARY

Sept. 24. TONYPANDY.—Laying about 170 lineal yds. of 12 in. surface water drain at Thomas Street, Tonypandy, for the Rhondda urban district council. Plans may be seen, and form of tender obtained of W. J. Jones, engineer and surveyor, public offices, Pentre, Rhondda, on deposit of one guinea. Tenders must be delivered under seal, and endorsed with the name of the contract, and addressed to the chairman of the council, public offices, Pentre, Rhondda, and delivered on or before Sept. 24. Fair wages clause. (See also "Roads and Cartage.")

Sept. 26. BARGOED.—Laying down about 150 yds. of 6 in. surface water drains, building manholes, fixing gullies, etc., at Bargoed; also erecting retaining walls and railings at Bargoed, for the Gelligar and Rhigos Rural District Council. Plans and specifications may be seen and bills of quantities obtained upon application to the council's surveyor, James P. Jones, council offices, Hengoed, via Cardiff. Sealed tenders, endorsed "Bargoed Improvements," to be sent on or before Sept. 26, to Frank T. James, 134, High Street, Merthyr Tydfil.

Sept. 29. LEYTON.—Construction of underground conveniences in Lea Bridge Road, Leyton, for the Urban District Council. Plans may be seen, and specification, bill of quantities, form of tender and other particulars obtained of William Dawson, M.Inst.C.E., at his offices, town hall, Leyton, between the hours of ten and four (Saturdays ten and twelve). Sealed tenders (in special envelopes supplied) must be delivered at the meeting of the council, to be held on Sept. 29, at the town hall, Leyton, at 7 p.m. Sureties will be required for the due performance of the contract.

Sept. 29. EALING.—Construction of new surface-water sewers in Windmill Lane, etc., and manholes, etc., in connection therewith, for the town council, as under:—about 1,330 ft. of 9 in. stoneware pipe. Drawings and specification may be seen, and forms of tender, together with schedule of quantities and other particulars, obtained from Charles Jones, M.Inst.C.E., borough engineer, town hall, Ealing, W., any day during office hours, upon a deposit of £2 2s. Sealed tenders, in the envelopes provided, endorsed "Tender for New Surface-Water Sewer," must be delivered not later than 9.30 a.m. on Sept. 29, to Geo. E. Brydges, town clerk, town clerk's offices, town hall, Ealing, W.

Oct. 5. URMSTON.—Supplying and delivering 21 in. stoneware pipes (300 lineal yds.), also stoneware drain tiles (35,000), for the Corporation of Manchester. Delivery will be required at the Davyhulme sewage works, Urmston. Forms of tender may be obtained on application to the secretary of the Rivers Department, town hall, Manchester. Tenders must be enclosed in the official envelope provided, and delivered at the above office not later than 10 a.m. on Oct. 5.

Oct. 12. DUNMURRY (Ireland).—Providing and laying about 4,800 lin. yds. 12 in., 9 in., and 6 in. stoneware and cast iron pipes, together with the construction of manholes, lampholes, ventilating shafts, flushing tanks, and other incidental works, for the Lisburn Rural District Council. Constructing purification works, irrigation area, and approach road to works, with bridges over river, and all works pertaining thereto. Drawings and specification may be seen, and bill of quantities, with form of tender, obtained, on payment of three guineas, from the engineer, James Hunter, B.E., Antrim Road, Lisburn; or Samuel C. Hunter, quantity surveyor, Scottish Provident Buildings, Belfast; or from the clerk to the council. Sealed tenders, endorsed "Dunmurry Sewerage," must be delivered not later than 10 a.m. Oct. 12, to William Sinclair, clerk of the council, Lisburn Workhouse.

Oct. 13. LONDON.—Construction, in the Metropolitan boroughs of Deptford and Greenwich, of 1,026 ft. of cast-iron sewer, for the L.C.C., of which part is 10 ft. internal diameter, and part in two pipes each 6 ft. 9 in. internal diameter. About 777 ft. of the sewer is to be formed in tunnel and the remainder in open cut. Persons desiring to tender may obtain drawings, specifications, bills of quantities, form of tender and other particulars on application to the chief engineer, Maurice Fitzmaurice, C.M.G., at the county hall, Spring Gardens, S.W., upon depositing with the cashier £10. Full particulars of the work may be obtained on application at the county hall, before payment of the fee. Each tender is to be delivered at the county hall, in a sealed cover, addressed to the clerk of the London county council, Spring Gardens, S.W., and marked "Tender for Greenwich Road Sewer Extension." No tender received after 11 a.m., on October 13, will be considered. (See also "Engineering.")

ROADS AND CARTAGE.

Sept. 24. TREALAW.—Making up Trealaw Road, Trealaw, under the private street works act, 1892, for the Rhondda Urban District Council. Plans may be seen, and form of tender obtained, of W. Jones, engineer and surveyor, public offices, Pentre, Rhondda, on deposit of one guinea. Tenders must be delivered under seal, and endorsed with the name of the contract, and addressed to the chairman of the council, public offices, Pentre, Rhondda, and delivered on or before Sept. 24. Fair wages clause. (See also "Plumbing and Sanitary.")

Sept. 24. ROMFORD. — Supplying about 1,250 tons of best blue Guernsey granite, for the U.D.C., broken as to part to 1½ in., and as to other part to 2 in. cube. Forms of tender can be obtained, on application to either J. Turvey, surveyor, or the clerk. Tenders, marked "Tender for granite," with samples, to be sent not later than Sept. 24, to Charles T. King, clerk, council offices, Romford. A contract with bond, with sureties, shall be entered into by the person whose tender may be accepted.

Sept. 24. DEAL.—Supplying field surface picked flints, clean and broken to an even gauge, to pass through a 2 in. gauge, for the Corporation. The material can be supplied in quantities varying from 50 to 700 cubic yds. Conditions and tender forms to be had from the surveyor. Sealed tenders, endorsed "Flint Tender," to be sent not later than Sept. 24, to Thomas C. Golder, borough surveyor, borough surveyor's office, 23, Queen Street, Deal.

Sept. 24. BLANDFORD.—Work of steam rolling the district roads during the half year ending March 31, 1909, for the R.D.C. For forms of tender and other particulars apply to Edward Phelps, district surveyor, Blandford. Tenders must be enclosed in sealed envelopes, endorsed "Steam Rolling Tender," and delivered on or before Sept. 24, to Sinclair Traill, clerk to the Blandford rural district council, Blandford, Dorset.

Sept. 25. HOPTON (Mirfield). — Draining, forming, macadamising, flagging, etc., Chadwick Road and Wood End Road, Hopton, Mirfield. Drawings and specification may be seen, and quantities and form of tender obtained at the office of the engineers, on payment of one guinea. Tenders, sealed and endorsed "Tender for New Roads," must be delivered before 10 a.m. on Sept. 25, to C. H. Marriott, Son and Shaw, civil engineers, Church Street Chambers, Dewsbury.

Sept. 26. EARLSHEATON.—Paving portions of footpaths at the fever hospital, Earlsheaton, for Dewsbury Joint Hospital Board. Specifications and forms of tender may be obtained on application at the office of the clerk. Sealed tenders, endorsed "Tender for Paving," to be delivered not later than Sept. 26, to H. Ellis, clerk, town hall, Dewsbury.

Sept. 26. LETCHWORTH—Construction of about 2,000 yards of metalled roads in the parish of Letchworth, for the Hitchin R.D.C. Plans and specifications may be seen at the council's offices, old town hall, Hitchin. Tenders marked "Tender for roads etc.," to be delivered not later than Sept. 26 to E. A. Passingham, clerk to the council, old town hall, Hitchin.

Sept. 28. CAERPHILLY. — Paving, curbing, channelling, flagging, sewering, forming, metalling, etc., part of Eglwysilan Road, Abertridwr, Morgan Street, and Church Street, Llanbradach, for the U.D.C. Plans and specifications may be seen and forms of tender obtained at the surveyor's office, Cardiff Road, Caerphilly, upon depositing the sum of £1 1s. Sealed tenders, endorsed "Street Works," must be addressed to the chairman of the council, and delivered at the council offices, Caerphilly, not later than Sept. 28.

Sept. 28. ARUNDEL.—Supply and delivery of 450 cubic yards of clean, hand-picked surface flints, for the town council. Form of tender and particulars may be obtained of the borough surveyor, E. F. Farrington, town hall, Arundel. Sealed tenders, on the form provided, marked "Tender for Flints," to be delivered at the borough surveyor's office, town hall, Arundel, not later than noon on Sept. 28.

Sept. 28. HANDSWORTH.—Asphalting playgrounds and forming a paved cartway at the Handsworth new provided schools, for the W.R.C.C. Education Department. Persons desirous of tendering can obtain specifications from S. Absom, divisional clerk, education offices, Woodhouse, to whom tenders are to be sent by first post on Sept. 28.

Sept. 28. LITHERLAND.—Reconstruction of Violet Road, Litherland, for the U.D.C. Drawings and specification may be seen and quantities, form of tender, and all other particulars obtained, on application to A. H. Carter, surveyor to the council, public offices, Sefton Road, Litherland, on payment of 10s. 6d. Sealed tenders, endorsed "Tender for Violet Road," to be sent before noon on Sept. 28, to William Kirk, or J. W. Allen North, clerks to the council, 15, Lord Street, Liverpool.

Sept. 28. PECKHAM RYE.—Curbing, channelling, foundations for asphalt paving, and roadwork, for the Corporation of Camberwell, in the following new streets, viz.: The road in front of 2 to 10, Forest Hill Road, from the junction of St. Aidans Road, Peckham Rye. Forms of tender can be obtained from William Oxtoby, borough engineer, town hall, Camberwell. Tenders must be delivered not later than 6.30 p.m., Sept. 28, to C William Tagg, town clerk.

Sept. 28. SOUTHOWRAM.—Carting dross and granite for the U.D.C. as follows:—100 tons from Brighouse station to near Wharfe Bridge, 100 tons from Brighouse station to Grove cottages, 100 tons from Elland station to near Rawson's Arms Inn, 100 tons from Elland station to near Ashgrove, 100 tons from Brighouse station to Delvers Arms, 200 tons from North Bridge station to Law Lane, Southowram, 100 tons from North Bridge station to bank top dross, Staith, Southowram, 100 tons from North Bridge station to bottom of Marsh Lane, Southowram. Each tender must state the price "per ton." Tenders, marked "Carting Dross, etc.," to be sent not later than noon on Sept. 28, to R. W. Evans, solicitor and clerk to the council, Commercial Bank Chambers, Halifax.

Sept. 29. LEYTON.—Making-up, kerbing and paving private streets within the district, for the U.D.C. The paths are to be paved with patent Victoria indurated patent croft adamant, and patent Aberdeen adamant stone. Specifiction, quantities, and form of tender may be obtained on application to William Dawson, M.Inst.C.E., council's surveyor, at his office, town hall, Leyton, between the hours of 10 a.m. and 4 p.m. (Saturdays 10 a.m. and noon). Sealed tenders (in special endorsed envelopes) must be delivered at the meeting of the council, town hall, Leyton, on Sept. 29, at 7 p.m. Sureties will be required for the due performance of the contract.

Sept. 29. WILLESDEN. — Road-making and paving works in Furness Road and Cholmondeley Avenue, Harlesden; Okehampton Road, Kensal Rise; and Wotton Road, Cricklewood, for the district council. Plans and specifications may be seen, and all particulars obtained upon application to O. Claude Robson, M.Inst.C.E., engineer to the council, public offices, Dyne Road, Kilburn, N.W. Tenders, upon printed forms, endorsed "Private Streets," to be delivered not later than 4 p.m. on Sept. 29, to Stanley W. Ball, clerk to the council, public offices, Dyne Road, Kilburn, N.W. A £10 note to be deposited with each tender.

Sept. 30. WOKING.—Supplying 2,000 tons of granite, to be delivered at Woking station in such quantities as may be required, for the Urban District Council of Woking. Tenders are to be delivered, together with sample of material, by September 30, to G. J. Wooldridge, surveyor, council offices, Woking.

Sept. 30. KESTEVEN.—Supplying granite, slag-dust, and gravel, for footpaths, required for the main roads for the year ending March 31, 1910, for the county council. Specifications and form of tender may be obtained on application to the surveyor. Tenders, marked "Tender for Materials," with small samples, to be sent not later than Sept. 30, to W. B. Purser, Assoc.M.Inst.C.E., county surveyor's office, Grantham.

Sept. 30. LITTLEHAMPTON.—Scarifying and steam rolling of highways, about the district, in the months of November, and December, for the U.D.C. Tenders are to include a ten-ton steam roller, proper scarifier, fuel, oil, driver, driver's house, water barrel, and everything necessary for efficiently carrying on the work. Tenders, under cover, and marked "Steam Rolling," to be forwarded to the chairman of the Urban District Council, town office, Littlehampton, not later than Sept. 30, on forms to be obtained of the surveyor, H. Howard, F.S.I.

Sept. 30. TOOTING, S.W.—Repairing and remaking roads at the Grove fever hospital, Tooting Grove, Tooting Graveney, S.W., for the Metropolitan Asylums Board, in accordance with drawing, conditions, and specifications prepared by W. T. Hatch, M.Inst.C.E., M.I.Mech.E., engineer-in-chief. Drawing, conditions, specification, and form of tender may be inspected at the office of the Board, Embankment, E.C., and obtained upon payment of a deposit of £1. Tenders, addressed as noted on the form, must be delivered at the office of the Board not later than 10 a.m. on Sept. 30.

Oct. 3. BOLSOVER.—Materials and work required in metalling, paving, curbing, channelling and draining Spencer Street, within the district, in accordance with plans and specifications prepared by the surveyor to the council. Persons desirous of tendering may inspect the plans and specifications at the office of W. G. H. Browne, Ivan House, Bolsover. Bills of quantities may be obtained on payment of one guinea. Sealed tenders to be sent, marked "Tenders for Streets," on or before Oct. 3, to G. E. Carline, clerk to the Bolsover urban district council, 2, New Square, Chesterfield.

MISCELLANEOUS.

Building Operations Bill. The Building Operations and Engineering Works Bill, a review and criticism of which recently appeared in our columns, will again come before Parliament on October 12th, the first day on which the House commences the autumn Session. Early in the year, when first speaking of this Bill, Mr. Gladstone said he hoped that it would pass as a non-contentious measure; and as, on its introduction, it received a blessing in the Press from a prominent Labour leader, his hope seemed likely to be fulfilled. If rumour is correct, however, this early view has been somewhat modified by second thoughts. The Labour party have, of course, no objection to the principle of the Bill. The contrary, in fact, is the case, it being legislation for which they have pressed for some considerable time. Their objection may be said to be confined to the question of administration. The Bill proposes that the building regulations which will follow it into law shall be carried out by the District Councils, and this is the foundation of the trades unionists' objection, they thinking that the Home Office is the best authority for dealing with the matter, as being free from all suspicion of local influence. If consistency, however, is one of the virtues of the Labour party, they must find themselves in a somewhat difficult position. It has been one of the planks in their platform to press for a reform of the Factory Department of the Home Office, on the grounds that the inspectorate were not chosen from amongst the most suitable men, University men having considerable favour; and, as the examinations were set to suit the University standard, practical men had not a fair field. Be that as it may, it follows that to ask that the present factory inspectors shall continue to do this work in spite of past criticisms seems unconformable with past and even recent utterances. Perhaps, however, it will be asked that a special staff should be appointed for this purpose. This will resolve itself into a question of expense to which the Home Office may not agree. A considerable number of men would be needed, and to this must be added the cost of travelling—no unimportant item. A compromise may meet the case. It will be remembered that Mr. Macfarlane, in the Building Accident Committee's report, referred to this question, and he suggested that while it would be a good thing to allow the local authorities to do the actual inspection, a number of Home Office inspectors could also be appointed, each having a large area. Their duties would be to supervise the District Council's work, and in this way set up a standard of efficiency to which exception could not well be taken. We commend this view to the notice of those concerned, as offering a ready means of fulfilling their desires.

Back to First Principles. Architecture as the mother of the arts is the real text of an article that is, however, headed "The Right Use of Art Museums," and that appeared in last Wednesday's "Times." The writer of the article insists that the problem of architecture, "to express use in terms of beauty," remains to some extent the problem of all the arts while they still keep their connection with architecture. "Even painting and sculpture are either controlled by the conditions of decoration imposed upon them by the great, useful art of architecture, or else share the purpose of the buildings which they adorn; and so long as arts share in the purpose of architecture, they have some of the grandeur and simplicity of that purpose. For Architecture, while it remains great, is an art, not of individuals, but of a whole society, and expresses the religion or patriotism of that society, not the ideas or passions of individuals. No doubt some of the greatest painting and sculpture of the Renaissance were produced when these arts were beginning to be divorced from architecture; but their greatness was built upon a long tradition, that had been established while architecture was still the predominant art and imposed its own purposes upon the other arts. Since architecture has lost its predominance, the other arts have slowly but surely been losing the grandeur and simplicity of purpose which they got from it. The first great collections of works of art began when the Renaissance was reaching its height, and when architecture was rapidly losing its predominance." Architects who feel themselves to be in some danger of forgetting the rudiments of their early reading may be glad to meet with this terse summary of first principles. The rehearsal of the articles of their belief may enable them to form some idea of the distance (if any) to which they have erred and strayed from fundamental truth or faith.

The Taxation of Land Values. An editorial note upon the letter of "Another Architect," in our last week's issue, has drawn upon us a spirited reply from that correspondent, who laments the "very invidious position" in which we have placed ourselves by the attitude we are adopting on this question. He thinks we "cannot be aware of the feeling amongst all classes—up north at any rate—on this question of rating." He also queries whether we ever see two of the London daily papers supporting the present Government, and beseeches us not to confess that our political opinions are derived from another widely known London daily, which evidently does not meet with his approval. "Another Architect" may be quite happy; we do not form our political opinions from any of the newspapers, which are too saturated with party rancour and venom to be safe guides on political questions. On the feeling in the North concerning the taxation of land values we are quite willing to take his word, though we question whether that feeling is stronger in the North than in the South; but, from the newspaper cuttings he is good enough to send, we judge that these strong views are not unconnected with the doings or misdoings of a certain ducal landlord in the particular district of Yorkshire from which our correspondent writes. All this, however, is beside the point. The taxation of land values is a political question upon which we express no opinion; it is a matter for the electorate. We, at least, are not concerned to excuse or save anyone from paying any dues which the nation may decide to be just and equitable. But our articles dealt with the present condition of distress among architects, and our correspondent affects to believe that this is due to land values going untaxed, and that if taxation is imposed, all will eventually be well. We ventured to express a doubt as to this view, about which we are not at all sanguine. We pointed out that London is greatly overbuilt, and we have the same report from Leeds and Sheffield, while it is notorious that the Glasgow Corporation has large areas of land on its hands which builders will not look at. We believe in this case—and on very good grounds—that "a man's enemies are they of his own household," and until architects, as a body, can sink silly differences, petty jealousies, and personal egotism, banding themselves together to secure their proper share of the nation's building activities, they will continue to suffer. The taxation of land

values may bring down the value of land, afford better sites for houses, and render possible the building of garden cities, but it will not ensure that architects have the designing of those houses or cities. On any renewed activity in the building trade resulting from this or any other measure, we shall greatly rejoice, but that is not quite the point.

Material Interests.

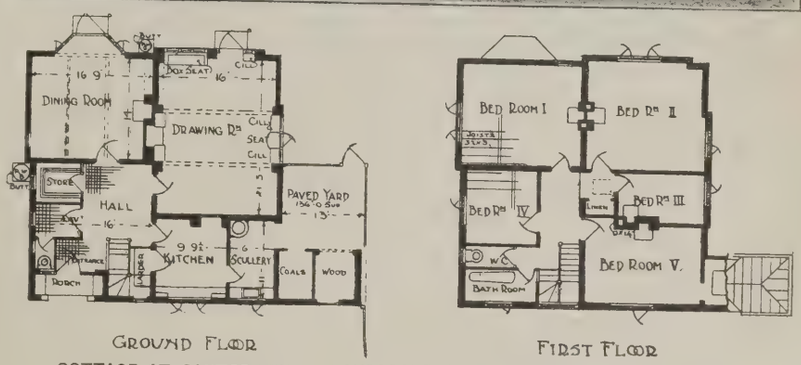
To the architects' already formidable incubus of worries must now be added, it seems, those arising from the local material mania. The contractor is becoming accustomed to the formulary, "Local labour must be as far as possible employed," and the architect may expect to meet with some such condition with respect to local materials. Apparently it is coming to that. We had long noted with awe the noble rage of the Scots against the importation of granite, and of the Irish against anything foreign whatsoever; while in England, just now, the exquisite amateur of landscape effects contends that buildings must spring from the soil on which they stand, otherwise the exceeding bitter cry against "the disfigurement of the country" must continue to grow in volume and intensity. Scotland, Ireland, and England, then, being each in the enjoyment of a well-established, if not well-founded, building grievance, it was only to be expected that gallant little Wales should make similar manifestations. She is doing it, but she wears her rue with a difference. She has adopted a subtle refinement on mere chauvinism. Hers is not a question of "Wales against the world," but of North against South; and it is not a question of race, but a question of colour. The case is thus compendiously stated in a local newspaper: "The fact that it is intended to utilise slate from a South Wales quarry to roof the new buildings of the University College of North Wales has raised a storm of protest in the press and at meetings of public bodies." The architect is not blamed. He is simply worried. It is magnanimously recognised that his choice was made "on æsthetic grounds." But it is insinuated that the college authorities have fallen short of their duty in failing to correct his little mistake of supposing that æsthetic amenity was of the least consequence as compared with local labour interests. "Considering the generous suport extended to the college by the North Wales quarrymen, whose efforts on behalf of the cause of education are so frequently emphasised as an example worthy of emulation by the artisan class generally, it is not altogether surprising that there should be a feeling of resentment against the exclusion of the product of our local quarries in the construction of the new college buildings." The feeling, indeed, is neither "altogether" nor at all surprising, *"Do ut des"* being a deep-rooted and perhaps ineradicable principle of human conduct; but the particular "emphasis" it lays on the quarrymen's efforts in a noble cause seems somehow to discount the "generosity" of their support, and slightly to tarnish its lustre as a shining example to "the working class generally." At all events, the architect has our sympathy, since, in the circumstances, the roof he has specified can hardly be expected to afford him adequate shelter from this "storm of protest." Evidently, architects, if they would avoid local storms, must henceforth vie with novelists in the study of local colour.

THE QUADRIGA TO COMPLETE THE WELLINGTON ARCH, CONSTITUTION HILL. CAPT. ADRIAN JONES, SCULPTOR.

This view, showing the group in position, will give an indication of the effect when finished.

Copyright in Buildings.

The question of copyright in buildings is to be pressed to some sort of an issue at a Diplomatic Conference that is to be held in Berlin on October 18th. Continental architects have long felt it to be an injustice that their original designs have not been accorded the same protection as the works of painters and sculptors; but in this country the subject does not excite very keen interest. Yet it certainly appears that in this matter the architect occupies an anomalous position, and is placed at some disadvantage, when it is considered that while every fitting on, in, or about a building may be copyright, the fabric itself can be pirated without restriction, except as regards any protected details of construction, in which the architect usually has no proprietary interest whatever. But the essential feature of copyright—that it secures to the designer or the holder the enjoyment of such pecuniary recompense as the design is capable of attracting—is less appropriate to a building than to a picture, a statue, or even a chimney-pot. Doubtless a good deal depends on mere facility of reproduction. Copyright, by preventing unauthorised multiplication, secures to the author the rights, opportunities, and profits of multiplication. But who wants to multiply copies of Liverpool Cathedral, or the new London County Hall? In the case of large and important buildings, close and deliberate copying is almost ruled out. The clients usually want something original, and the assessors see that they get it. With regard to smaller buildings, the case is different. One has heard a good deal of pirated designs of churches; and a clever architect may produce a peculiarly attractive design for, say, a middle-class villa, which is immediately reproduced wholesale by men of no originality, who are left to the iniquitous enjoyment of the fruits of another man's genius. Or, to come still lower down, some enterprising speculative builder may obtain, for a first and final payment of a few paltry pounds, a small number of more or less original designs, from which he builds hundreds of houses, whose face is their fortune, and his, but not the architect's. To this common practice of extensive multiplication of designs, the cardinal principle of copyright would seem to apply. On the other hand, there can be no doubt that copyright in buildings would introduce many complications that, operating vexatiously, and in restraint of trade, would probably far outweigh any advantages that might accrue to anybody but the lawyers.



THE ARCHITECTURAL PROFESSION OF TO-DAY.—III.

Whilst in the event of the adoption of registration it would still, in all probability, be impossible to prevent the architectural charlatan from supplying designs for buildings, yet it would be quite possible to prevent him from continuing to pose as a responsible architect, and the public would soon learn to discriminate between the trained artist and the unqualified man when the line of demarcation has once been made clear. Of course, there is no doubt that before any protective measure could become law, many persons who are to-day improperly describing themselves as architects, and thus obtaining money from the public under false pretences, would have to be officially recognised as competent men. This result is inevitable, and must always be expected when the existing principle of the "open-door" is suddenly abandoned by any professional body of men. Time, however, invariably provides the remedy for the evil, which is usually one of a very ephemeral nature. But whatever may be the effect on the community at large of any effort to make the profession of the architect one that would naturally appeal to the mind of any liberally educated young man possessing appreciation of the real significance of art, the practitioners of to-day would do well to set their own house in order before they attempt—to use a now familiar phrase—"to educate the public." Surely the education of the man in the street is best assured by the production of *good* work from architects themselves rather than by the issue of any amount of popular literature upon the subject of an art concerning which its very professors are unable to agree! It has often been stated that the predilections of the public with regard to questions of architecture may be rightly and justly ignored, but do architects exhibit much more discernment and enlightenment? On both sides there is a tendency to over-rate professional success. In the case of the public such a feeling is perfectly excusable, as it generally arises from sheer inability to discriminate between good, bad, and indifferent work. But with regard to the attitude of the profession, the case is much more serious, because some architects appear to gauge their respect for the opinions of their successful brethren proportionately to the worldly prosperity of the latter rather than proportionately to the artistic value of their work. And in this connection it is not pleasant to remark that often the eulogistic—nay, sometimes almost fulsome—praise publicly bestowed upon the works of the successful architect of the day by a *confrère* who may happen to occupy a high official position, is unhappily much discounted by the nature of the remarks made by the public eulogist in course of private conversation. Now, what useful purpose is served by discussing the question of the architectural edution of the public when architects themselves thus assist in misleading the community on matters of art by publicly beluding the architecture of buildings which they privately condemn?

There are occasions upon which silence is indeed golden; and when a successful architect becomes the recipient of the party congratulations of his professional brethren, surely it ought not to be obligatory on the speaker, who, for the time being, acts as the mouthpiece of the profession, to express, on behalf of that body, very much more than he personally can honestly admit? How can it be expected that men, whose professional services are eagerly sought by the public, and whose architectural achievements, be they good or bad, thus ostensibly receive the weight of professional approval, will ever be brought to understand that, certainly through no want of ability, through no fault of their own, but simply owing to the lack of opportunities of obtaining a course of systematic architectural training, their reputations, in many cases, will not outlast their lives, and consequently they possess no right, either inherent or acquired, to oppose—to the great detriment of the profession at large—many measures of reform embracing proposals not only affecting the welfare of a large majority of their fellow-architects, but necessary to the advancement of the art of architecture itself? Then, too, it must not be forgotten that to the man who has succeeded, perhaps in some case beyond his deserts, mundane affairs assume a particularly roseate hue. He quickly forgets his early struggles and the extreme pathos of the seamy side of an ill-paid calling. As a rule, immediately he has secured a remunerative practice, his work commences to show a decided falling-off in quality; he even, occasionally, becomes not altogether free from the taint of egotism. But it is to men of this calibre, who do not and cannot appreciate the necessity for reforms and innovations, to whom alone architects are accustomed to look for guidance on questions vitally affecting the immediate future of their profession, and by whose often selfish and purely personal views they are content to be led. All the architects of to-day are suffering more or less from the effects of the lack of an early systematic course of architectural training, and the leaders of the profession in this respect may generally be regarded as being in the same category with the rank and file.

It is perhaps scarcely an exaggeration to say that, solely owing to the general appreciation of their work, some of the most indifferent and unscholarly architects of our time have become the recipients of honours and distinctions which the quality of their architecture in nowise merits. But these are the very men who are bitterly opposed to the introduction of a system of compulsory education, and their influence and example have had, hitherto, a most injurious effect upon the welfare of a certain wise and far-seeing proposal, under which future members of the architects' profession would have been drawn from the ranks of the well-educated and cultured classes. In every profession the measure of the status of the average member is the measure of the status of the whole, and it is therefore the duty of all practitioners of to-day to do their best to see that the succeeding generation of architects does not suffer from any lack of

GROUND FLOOR FIRST FLOOR

COTTAGE AT CANTERBURY. LOVEGROVE AND PAPWORTH, ARCHITECTS.

This cottage is built of local red bricks and tiles, and the roughcast finished a light cream colour. The walls are hollow, of two half-brick walls connected together with galvanized iron wall ties. It was erected from the designs of Messrs. Lovegrove & Papworth, of Town Hall Chambers, 374-8, Old Street, E.C., at a cost of 5½d. per foot cube.

those educational advantages which alone will enable the architectural student to assist in the advancement of his art. In addition, let the younger men of to-day be frankly told that architecture in this country is—for the time being—at a very low ebb, and be warned that to indiscriminately copy modern work is not only futile, but positively injurious to their artistic success. Briefly, let present practitioners show an unselfish devotion to their art by bestowing upon their successors facilities for the acquisition of architectural scholarship that can only be obtained through a systematic course of compulsory education. Thus, and thus only, will the architects of the future be enabled to become not only greater artists than those of to-day, but also fully equipped to raise the whole tone of the profession whether it be viewed from its intellectual, its moral, or its artistic aspect. Genius cannot be created but mediocrity can be dragooned into respectability, as the Ecole des Beaux Arts has taught us.

We would earnestly impress upon all architects that it is their duty not to allow themselves to be turned from this, the only straight path, by any arguments, however specious and plausible, that may be put forward by a small would-be autocratic clique, to which we think a more than sufficient amount of deference and obsequiousness has already been shown. On the contrary we advise them to combat any tendency they may possess to blindly follow the lead of any man, however successful his career, unless—and "by his works ye shall judge him"—he shows an exceptionally great amount of architectural ability. In a word let every architect think out the great problem of the present and future welfare of his profession for himself and act, after careful study and deep reflection, according to his own convictions. We doubt not that he will soon see the fallacy of the oft-quoted remarks that "an architect is born not made," that he should "remain unfettered by scholarship or tradition" and, we presume, consequently be free to waste his life and abilities upon the production of hideous travesties of the architectural refinements of the art-loving ages of long ago?

Architects should make themselves familiar with the details of the self-sacrificing lives of the great masters of their art; they should regard the splendid monuments—many of which happily are still in existence—of old-time study and genius, and then glance at the architectural achievements of their degenerate successors, the "eminent" architects of to-day. The critically minded observer will be in a position to appraise modern work at its real value, and be ready to turn a deaf ear to vague twaddle on "art and inspiration" and above all to the affected nonsense uttered with regard to that—probably mythical and certainly undesirable—alien architectural obstructionist, the egregious, untutored genius.

Until architects themselves are in agreement as to what constitute the first principles of design it does not appear to be very reasonable to blame the public for being unable to discriminate between the essential factors that make for what is good or for what is bad in architecture. Just as only a literary expert can be expected to differentiate between a great and a minor poet, so only the judgment of the educated architect should be accepted on any question concerning the art we are discussing. But here, as we have already pointed out, is another difficulty inasmuch as, with very few exceptions, modern architects have been trained with no very clear or definite ideas of any special period or phase of art. Let us briefly review the changes in style which have occurred in England since many of the leading architects of the day commenced their professional careers. Some thirty-five years ago that most untoward architectural movement known as the Gothic Revival was nearing its close, although at the time its early dissolution was probably unsuspected. The young architects of that day were therefore fired with enthusiasm for Pugin's "True Principles" which they were trained to apply indiscriminately to designs for ecclesiastical, civic and domestic buildings. A few years later and the tide of architectural taste had turned in favour of the so-called "Free Classic" or "Queen Anne" style which in its turn was supplemented for a short time by the often picturesque, but generally anomalous and debased, architectural medley typical of "Jacobean" or early Renaissance art.

(To be continued.)

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.		COMPETITION.
Oct.	7	INVERNESS. BOAT SHELTER. Engineers invited to submit plans for a scheme, not exceeding, in cost, the sum of £10,000. Conditions from Kenneth Macdonald, Clerk to the Harbour Trustees, Town House, Inverness.
Oct.	31	BURY. NEW SECONDARY SCHOOL for the Education Committee. Premiums of £50, £25, and £10. Particulars and site plan from Robert Wilkinson, Director of Education, 8, Bank Street, Bury. Deposit £1 1s.
Oct.	31	*ROMFORD. COUNTY HIGH SCHOOL FOR GIRLS. Applications for Conditions to D. T. Williams, 71, South Street, Romford, Essex, to be made by or before August 24th, accompanied by deposit of five guineas, of which sum five pounds will be returned on receipt of bona fide design.
Nov.	1	CARDIFF. COUNTY HALL AND OFFICES. Particulars and site plan from T. Mansel Franklen, Clerk, Glamorgan County Council Offices, Cardiff.
Nov.	14	WHITEHAVEN. NEW PUBLIC ELEMENTARY SCHOOL, Irish Street, for 700 children. Limited to Cumberland architects. Plan of site and conditions from W. D. P. Field, Secretary, Education Committee, Town Hall, Whitehaven. No statement as to premiums or deposit.
Dec.	14	BLACKPOOL. CENTRAL PUBLIC LIBRARY.—Premiums of £52 10s., £31 10s. and £21. Particulars and site plan from T. Loftos, Town Clerk, Town Hall, Blackpool. Deposit £1 1s.
No Date.		CORNWALL COUNTY OFFICES.—Designs and *Estimates* invited. Premiums of £50 £20 and £10. Premium for successful design to merge in Commission. Particulars from C. L. Cowlard, Clerk to County Council, Bodmin. Deposit, £1 1s.

** This competition has been unfavourably reported upon by a Correspondent.*

Ryde, I.W.—In the open competition for a parish hall and institute at Oakfield, Ryde, to cost about £1,000, the selected plans were prepared by Mr. George Boughton, M.S.A., Ryde, who has been appointed to carry out the work.

Bakewell Public Baths and Pump Room.—It is stated that several architects are preparing plans for the above buildings, for the best of which a premium of £25 has been offered.

Dolgelly Free Library and Institute.—The result of the recent competition has been announced as follows:—First, Mr. E. A. Fermaud, Denbigh Street, Wilton Road, Victoria, London, S.W.; second, Mr. Ellis, Aberdovey, North Wales; third, Messrs. Lavender and Edwards, Wrexham.

Concerning the Cornwall County Council offices competition, "A Cornish rate-paying certificated Architect" writes to the "Western Morning News as follows: An advertisement in your paper concerning the above appears to me to be almost an insult to members of the architectural profession. By it the Cornwall County Council calmly invite architects to deposit a guinea with their clerk in order that they may be allowed to give the Cornwall County Council the benefit of their knowledge and experience and have a chance of winning a paltry premium which is to be merged into a questionable commission for the successful designer, provided, I suppose, he be employed to carry out the work! Why, this is a worse lottery than a "Limerick," and the Cornwall County Council must really be careful or the law will be down on them. How would lawyers, and doctors, and other professional men like it if possible employers were to advertise for their services in such terms as those printed by you? And what kind of men is it supposed that such advertisements will be answered by? This competition is on a par with others promoted of late years by our expensive Cornwall County Council, and it indicates penny-wise and pound-foolish methods of business which new blood in their ranks might rectify. The Cornwall County Council would stand a better chance of obtaining good and honest designs from Cornishmen for their office if they were to state in their preliminary advertisement that (1) a professional assessor would be appointed to advise them on the relative merits of designs submitted; (2) that the competition would be confined to certificated Cornish architects; (3) that none of the officials of the Cornwall County Council would be allowed to compete for, or carry out, the selected design; and (4) that the amount of the successful competitor's be named and the guinea deposit fee omitted, or say, lowered to five shillings, to insure the receipt of designs representing a month's labour and expenses, from each of those architects who may be persuaded to join in the gamble!

Notes and News.

A welcome all-round improvement in trade, reported from Leeds, naturally improves the outlook for builders. It is claimed in the local press that Leeds is "the pulse of trade." In bad times Leeds is among the last centres to feel the depression, and in improving times it is among the first to feel the spring.

* * *

The lectures in practical sanitary science and civil engineering, arranged by the Institute of Sanitary Engineers for the session 1908-9 are divided into two courses, of which the preliminary begins on Tuesday, October 5th, 1908, and ends on Thursday, November 19th, 1908, and the Advanced begins on Tuesday, January 5th, 1909, and ends on Thursday, April 1st, 1909. Ten lecturers are named in the prospectus, which can be obtained from the hon. sec., Mr. N. W. Hoskin, 120 and 122, Victoria Street, S.W.

Messrs. J. Weeks and Co., specialists in horticultural buildings and heating apparatus, whose business was established in Chelsea exactly a century ago, have opened new offices at 72, Victoria Street, S.W. Weeks' duplex upright tubular boilers have been used, it is stated, not only for heating glass houses throughout the kingdom, but also in a large number of churches, schools, and public buildings at home and abroad, and they have been installed in the South Kensington Museum, Canterbury Cathedral, and Netley Hospital.

* * *

Among the houses of historic or personal interest which are to be indicated in the near future by the fixing of County Council tablets are: No. 28, Herne-hill, associated with John Ruskin; No. 11, Carlton House Terrace, where Mr. Gladstone lived; and No. 4, Beaumont Street, W., once the residence of John Richard Green, the historian. Another house to be indicated is of special interest—namely, No. 14, Buckingham Street, Strand. Here dwelt not only the painters Etty and Clarkson Stanfield, but at a much earlier date the famous diarist, Mr. Samuel Pepys, who was succeeded in later years as a resident by Robert Harley, Earl of Oxford.

* * *

One of the oldest landmarks of Paris, the ancient Hotel-Dieu (hospital), which overlooked the Place de Notre Dame, is being demolished. It was founded by St. Landry about the year 660 in the episcopacy of the 28th Bishop of Paris. In the 12th century it was enlarged, and later its name was changed repeatedly—Hospital of St. Christopher, House of God, House of Our Lady, Hotel of Humanity (during the rebellion), and finally once more Hotel-Dieu. Its occupation was gone 30 years ago, when the fine present Hotel-Dieu was built. The question was long agitated whether the old building ought not to be burnt down on account of the danger to Paris of the germs of disease which must be lurking in every nook and cranny of its hoary walls, but the risk from fire to the surrounding houses was considered too great, and it was finally decided to disinfect very carefully with liquid solution each portion of the building as it was being demolished.

* * *

The Lord Mayor of Birmingham has consented to open the Midland Counties Building Trades Exhibition on Monday, October 12th. The organisers of the exhibition have arranged that in addition to the cash prizes and certificates which they are awarding to the successful competitors in the competitions for students and apprentices, to give 5 per cent. of the gross takings at the gate to such local charities as the committee may decide.

* * *

The demonstration of the uses of the Williams "Gripall" floor cramp, which was announced in the columns of our issue of the 9th inst., was successfully held at our offices last Thursday. Mr. Williams, who attended personally, brought with him a small model floor, which was divided up into a floor on floor, a concrete floor and the ordinary open joists. With this model he clearly showed how easily his cramp could be used. The builders, concrete specialists and surveyors who attended unanimously agreed that this was the best cramp that they had seen.

ST. PETER'S CHURCH, BROWN STREET, GLASGOW.
REMODELLED BY SALMON AND SON AND GILLESPIE, ARCHITECTS.

This was originally a square church with heavy looking galleries round three sides supported on light iron pillars. These galleries were taken out and the church remodelled in the form of a Greek Cross. The contractors were:—Mason work, R. Gilchrist & Son; joiner work, Anderson & Henderson, Ltd.; plumber work, R. Munro & Son; plaster work, W. Tonner & Son; slater work, A. D. & MacKay; heating, J. Combe & Son; electric wiring and fittings, Andrew Hutcheson; painter work, Thomas Lawrie & Co. The cost was under £3,000.

Swansea Cottage Exhibition, which is to be held on the Town Hill Estate of the Swansea Corporation from June to October, 1909, will comprise the following classes:—(A) Houses to contain two bedrooms, large living-room, and scullery, maximum cost £175; (B) Three bedrooms, large living-room, and scullery, maximum cost £200; (C) Three bedrooms, parlour, large living-room, and scullery, maximum cost £225. The site consists of 50 acres. Ninety-two entries in the town-planning competition have been received. The awards have been made, but the names of the competitors are sealed, and will not be made known until October 3rd.

* * *

Attention is called by the secretary of the Liberty and Property Defence League to a Bill for the amendment of the law of distress for rent, which has passed through the House of Commons and the final stages of which will be passed in the House of Lords during the autumn sitting. This Bill, the secretary contends, would not only injure landlords, but would react most unfavourably on the position of tenants generally. In 1871 the goods of lodgers were protected from distress by a superior landlord for the arrears of rent owing by his immediate tenant, and it is proposed now to extend this protection to the goods of "any under tenant, lodger, or other person not being the immediate tenant of such superior landlord." These words, it is contended, are so vague as to be dangerous, and if they are adopted for legislative purposes they will necessarily result in litigation before their legal meaning can be settled. It is further assumed that if this Bill were allowed to pass, tenants, as a class, would, in the long run, lose far more than landlords.

The session of the School of Architecture at University College, London, will begin on October 5th, on which day students should attend to arrange their courses with Professor F. M. Simpson. In addition to the regular three-years' courses for degree and diploma students, there will be a special course on French Mediæval Architecture by Prof. F. M. Simpson, on Tuesdays, at 7.30, beginning on October 13th. There will also be two design classes conducted by Mr. Cyril E. Power, A.R.I.B.A., under the supervision of the special visitors, Mr. Leonard Stokes, F.R.I.B.A., and Mr. Ernest Newton, F.R.I.B.A. The senior design class meets on Mondays and Wednesdays at 6.45, beginning on October 7th, and the junior design class on Mondays and Thursdays at 6.45, beginning on October 8th.

* * *

Scarborough.—The Town Council of Scarborough recently recommended that application should be made to the Local Government Board to sanction the borrowing of a further sum of £12,000 for the Scarborough Marine Drive. It was proposed to construct caissons or an apron at the foot of the wall. The main object in view is to preserve the drive, on which £100,000 has been spent. Mr. P. W. Meik has reported that the wall had moved forward more or less under the combined influence of too heavy back pressure and too little resistance at the foot. An additional weight, or else a greater hold on the gravel, is required, and he therefore recommends the construction of 23 caissons at a cost of £400 each, having between and in front of them an apron or boulders, the total cost being about £9,200, in addition to putting down the apron. After considerable discussion, the proposal to promote a provisional order and to effect the loan was rejected.

C

L.C.C. CENTRAL SCHOOL OF ARTS AND CRAFTS.

The following description of the new Central School of Arts and Crafts, which has just been completed, has been supplied by Mr. W. E. Riley, F.R.I.B.A., the superintending architect, from whose designs and under whose direction the work has been carried out.

The site, which is irregular in shape, has a frontage to Southampton Row of 106ft. 9ins., and to Theobald's Road and Paxton Street of 106ft. 6ins., and it has been necessary to cover practically the whole ground in order to give the required accommodation. The building contains a basement and six other storeys, which together give a floor-space of about 74,000 square feet; it contains in all seventy rooms, viz., forty-two class-rooms or workshops, a large central hall, common room, administrative offices, and staff rooms.

In the basement are the rooms for the heavy work, comprising leadwork, stonework, ironwork, metal-casting, etc. Here also are the principal lavatory for the students, and the boilers for the heating system, which is common to this building and to the adjoining training college for teachers.

On the ground-floor are the administrative offices, staff-rooms, common rooms for the students, class-rooms for architecture and wood-carving, and the central hall, which is lighted by a dome. A lecture theatre to accommodate 300 is situated on the corresponding floor in the training college; it is directly accessible from the school, and is intended to be used jointly by both departments. On the first floor are the class-rooms and workshops for goldsmiths' and silversmiths' work and allied crafts, including chasing and repoussé, modelling, engraving and die-sinking. On the second floor are the class-rooms for the arts and crafts in connection with book production, namely, illuminating, typography, lithography, wood engraving, and bookbinding. On the third floor are the rooms devoted to the arts and crafts connected with cabinetwork and furniture, namely, drawing and design, cabinet-making, polish, and upholstery. On the fourth and fifth floors are the studios, class-rooms, and workshops, which require special consideration in their lighting, viz., those for life-drawing, painting, modelling, stained glass, decorative plaster, embroidery, and weaving.

Accommodation is provided for about 900 students at one time. Special arrangements have been made for adequate means of escape in case of fire, and the general construction of the building is fire-resisting throughout.

The general height of the class-rooms from floor to ceiling is 13ft., that of the central hall is 23ft. to the underside of the dome. The height of the building from the street to the top of the cornice is 75ft. 6ins., and 87 ft. 6ins. to the ridge of the roof.

The façades to the streets are of Cornish granite from the Colcerrow quarries, and Portland stone. The entrance and central hall are paved with Hopton Wood stone.

The building has been designed, conjointly with the adjoining training college, in a plain and substantial manner, with the intention of giving expression to the purposes for which it is used.

The work of erecting the building has been carried out by the Works Committee of the Council, under the immediate direction of Mr. G. W. Humphreys, the Council's Manager of Works.

The work in connection with the heating and electrical equipment has been carried out under the supervision of Mr. Maurice Fitzmaurice, C.M.G., the Council's chief engineer. The following is a short description of this portion of the work:—The electrical energy for both lighting and power purposes in this building is supplied by means of two distinct services, and in the event of the failure of either of these, an automatic switch will bring the other into use. Inverted arc lamps have been largely installed and incandescent lamps, where used, are of the metallic filament type. Electrical energy also drives the two large exhaust fans which deal with the ventilation of the building and a goods lift for serving each floor. Fire alarms have been fitted throughout the building, and a system of electric clocks on the Magneta system is provided for the principal rooms. Provision is also made in some of the class-rooms for the use of electrical power for the purpose of driving mechanical tools, heating small furnaces, etc. Special consideration has been given to heating and ventilation, the heating apparatus consisting of radiators heated by low-pressure steam on the vacuum system, fresh air being taken in through the outer walls, and warmed before entering the rooms. Each radiator is separately controlled. The steam is raised by two large multitubular boilers of the Cornish type placed in the basement. The school is under the direction of Professor W. R. Lethaby. The annual exhibition of students' work executed during the preceding session was on view on Thursday, Friday and Saturday, September 17th to 19th.

A brief visit to the exhibition on a rather gloomy day impressed us with the idea that some of the class-rooms in which it was held were insufficiently lighted, but it must be admitted that the light was bad outside as well as inside; only it struck us that more window-space was wanted. The architectural drawings exhibited were not particularly interesting. That the designs for town houses, small churches, country cottages, and village halls, were somewhat lacking in originality of treatment, is perhaps rather a merit in the work of young students, who should rather be encouraged to imitate good models than to indulge an untrained fancy. The drawings were uncommonly clean and workmanlike, with a characteristic tendency to over-elaboration. This, again, is "a good fault" in students, with whom the time for pruning, as well as for the full expression of individuality, is not yet. The stained glass was remarkable for the general vigour of design and the general dulness of the colouring. The statuary was, if due allowance be made for the apprentice hand, strikingly bold and firm in the modelling, with a notable absence of mere prettiness. Altogether, the exhibition inspired hopefulness for the career of the students, and confidence in the ability of the teachers.

Falmouth.—An important scheme is on foot to construct a large dock at St. Just Creek, in Falmouth Harbour. The depth of water would permit the berthing of ocean liners, and it would be of great value to China clay exporters.

THE ARCHITECTURE OF DUBLIN.

The Handbook to Dublin prepared for this year's meeting of the British Association has an interesting chapter in the Architecture of the City by Count Plunkett, M.R.I.A., in the course of which the writer says:—"The natural conditions which affect its foundation continue to exercise a strong influence on the preservation, expansion, and sanitation of Dublin. The site of the city was an irregular slope towards the river and the sea, diversified with small hills. Among the drawbacks of its position were the low-lying stretches of land within the city, and the expanse of sand through which the river meandered. Towards the river ran several water courses, and even on the hillocks were many springs and some undrained bogs. Several rivulets still run under the city. Like many of the English cathedrals, Christ Church and St. Patrick's were built on morasses, which continue to menace these ancient buildings. The Dublin mountains, on the south, with their wooded slopes, reflect some beauty in the city, but the low-lying sea-shore that touches it has been of necessity a neglected foil to the city's architecture. Indeed, the old plan of the city remains practically unaltered, the principal thoroughfares, though more or less direct, are not so straight in line as to sacrifice variety. There are few streets of any length that are absolutely straight. Westmoreland Street and D'Olier Street diverge from the line of Sackville Street. Thoroughfares like Grafton Street, though short, and altered in recent times, and South Great George's Street, congested with business, are as winding as neglected back streets. The building of a city market, and the running of tram lines, make little change in the width and general plan of a Dublin street, owing to the penal cost of promoting improvements Bills in the Imperial Parliament. One of the greatest thoroughfares, Capel Street, though it has lost all its old-time quaintness, is as narrow as it was a hundred years ago, and Parliament Street, which continues it on the south side of the river, cramps the view of the city hall. The Wide Streets Commissioners in the eighteenth century made some bold changes, and planned reforms that are still called for.

"Many of the modern buildings suffer greatly from the want of 'distance' caused mainly by the narrowness of the streets. The most extended roadway in the residential quarter is that beginning at the east side of Merrion Square, and running in a straight line to Leeson Street. Owing to the irregular rise of the ground, the varying heights of the red-brick buildings, of the pleasant breaks made in the course by green squares and cross streets, this affords one of the prettiest and most reposeful views of the city."

There are illustrations, from old prints, of the Parliament House (Bank of Ireland), Trinity College, the Royal Exchange (City Hall), Custom House, and Leinster House, with some account of each building. Of the Parliament House Count Plunkett writes: "The general effect, with its 'confusion' of styles, is singularly beautiful and noble. It took genius to devise those great sweeping curves of the wings, to lighten the expanse of the screens with Ionic columns, to make the wide exposed portico solemn with massive Corinthian. The Parl

THE CUSTOMS HOUSE, DUBLIN. JAMES GANDON, ARCHITECT. [*Photo: Arch. Review.*

ment House covers an acre and a half with its semi-circle. One of the purposes suggesting the employment of Corinthian columns on the Lord's entrance was the harmonizing of the House with Trinity College." Of Trinity College itself the writer characterises Sir William Chambers' front as "fortress-like and impressive, and in great contrast to its beautiful neighbour."

Only two of the original old stone bridges, whose curves give such charm to Dublin streets, now remain. The old bridges rose too steeply for the convenience of traffic. The lattice iron bridge of the Loop Line Railway now quite spoils the view of the Custom House from the city. Of the Custom House it is said that it "was planned on a scale that seems quite out of proportion to the business of the city."

Some account is given of other notable buildings, and reference is made to the "private dwelling houses, whose merits have stood the test of time." Of these Powerscourt House is described as a "lovely building, now a warehouse."

"A distant view of Dublin in the eighteenth century," concludes Count Plunkett, "showed the city apparently spireless; and the first church of modern times with a spire of considerable elevation was St. George's, built by Johnston at the beginning of the nineteenth century. To-day the city's prospect is punctuated by spires of no little beauty, for its churches are many and mostly Gothic. Those who planned the city—while it was still in the making—had to consider the general perspective, and to calculate on the peculiar aerial effects of a climate almost moist. Their success in building according to their environment is strikingly illustrated by Malton who has recorded the impressionism of Dublin streets with absolute fidelity. In certain streets, such as Upper Fitz-William Street, the sky-line leads the eye directly to the Dublin Mountains, which, far from being dwarfed by their distance, loom up in the magnifying Irish atmosphere. Chromatic colouring was a thing not dreamt of by our old architects, but they had mellow-tinted bricks, and they frequently used cut-stone up to the first floor. Though a flatness of facade was the rule in private houses, many of the shops were saved from monotony of appearance by rounded fronts and the most elaborate 'leading'; and entablatures decorated with tenuous festoons were until lately to be seen in some of the back streets. "Irish architecture is generally reposeful, and its Queen Anne work seldom ran into the eccentricities common to the style. An ancient city, Dublin has no corbelled or timbered houses, and few gables. Most of its landmarks have disappeared. It has no gates; part of the old Dame's Gate was turned to use for the pedestal of the statue of William III., in College Green; and the castellated gate built by Johnston in 1812 was removed in 1846 from Barrack Bridge to the hospital at Kilmainham. Some thirty years ago there was in the Coombe and neighbouring quarters many quaint structures of the close of the seventeenth century. Now, the type of house with Dutch gable and sashes flush with the wall is only a memory. Little of Queen Anne work remains. About 1776 extensive changes began in the city—streets were opened in all directions, and the building mania lasted for nigh fifteen years. The style of architecture then common tried the gifts of the designer rather severely. The houses of this period stretch monotonously in a straight line through many of the most fashionable districts. They have suffered greatly from modernization, and the consequent sacrifice of effects relied on by the architects. The cross-line of small-panel sashes and the graceful scrolls of fan-lights are gone, leaving vacant spaces; of the striking link and lamp-holders, and other fine ironwork, there is hardly a trace. Many of the balconies have been removed, to be sometimes replaced by the pretentious castings of the fifties. It is only in architectural detail that we discover the finer qualities of the earlier time—in the beautiful proportions of doors, windows, and porticoes. The sense of beauty, however, found free play in the interiors—in their noble spaciousness, working balanced by the quality of the workmanship in stucco and joinery, and carving and inlaying, which made the seventeenth century Dublin house one of the most artistic of European dwellings."

LONDON SUBURBS.

I.—West Hampstead.

While central London is being rebuilt, it would be strange if the suburbs did not follow the example; and the vast increase of the metropolis during the last few years means not only the expansion of older suburbs, but the creation of new ones. The methods of their development, the styles, if styles they be, used in building, the accommodation provided for the tenants, the planning, such as it is, of the roads and the facilities of communication with the business centre of London, are all very much changed, and are still changing, since the north side of Regent's Park and St. John's Wood became north-western "suburbs," and Bulwer-Lytton could describe a "villa at Brompton" by the same word. It was entered, he tells us, by "a Gothic hall, six feet by four"; but although the remark was satirical, it was not ill-natured. All over the older suburbs, varieties of Gothic and Elizabethan continually cropped up, especially in detached dwellings; nor were they absent from that special variety of house-building known as "semi-detached." The growth of suburbs was slow, and the pressure upon land moderate; gardens consequently were liberal and well-planted; roads were wide, and there was a general sense of spaciousness. Now all is changing—changing incessantly; but it would be impossible to say that the changes point in one particular direction. All that is certain is the enormous and rapid growth, and when we hear of the Willesden district containing a hundred thousand inhabitants, we are driven to ask if the word suburb be any longer applicable; is it not rather a city, and would it not be better to treat it as a city?

Among the new districts, West Hampstead is one of the most convenient and rapidly-growing; its roads of villas are typical; its general appearance exhibits both the good and the bad points of a modern suburb. It was, not many years ago, the village of West End, and was a hamlet or offshoot of Hampstead: the name has been unwisely abandoned for the neighbourhood, though retained in West End Lane, virtually its main thoroughfare. Its older building designs exhibit the red brick with stone dressings of the red-brick revival of a quarter of a century ago; its gables are often Jacobean and not unpleasing, of the sort ridiculously misnamed "Queen Anne": one notable feature being the nearly universal use of dormers. Rising from the red roofs of the older villas, they are effective; in the new designs, they resemble zinc cisterns, and are intolerably ugly; in both cases they give only a very moderate amount of light to rooms full of awkward angles. This is a detail which calls for reform at the hands of new designers and builders of villas. The suburb stretches up the hill to the north-west towards Golder's Hill, and ends only at the western edge of Hampstead Heath. Here the houses are larger, the designs more elaborate, and the styles what are now collectively known as Renaissance, with a good deal of Georgian.

The curving roads are a pleasant feature of West Hampstead, mitigating the sense of monotony, and avoiding the mistake, so frequent on the Continent, of a *boulevarde à vue infinie*. In one sense, however, the boulevarde exists, and that is in its trees; the Finchley Road is well planted with them, and they have been introduced in other roads. Here, as in most of our outlying districts, the word "street" is almost unknown. Almost every variety of villa is to be seen. Twenty years have been found sufficient to tone their red bricks to a pleasant hue, and weather the stone dressings to a mellow tint, to say nothing of a plentiful growth of ivy. In some cases, indeed, too plentiful, for the creeper has been allowed to cover the entire surface of the house up to the eaves, converting it into a sort of "Jack-in-the-Green." These, however, are rare.

Of course, the neighbourhood is not without that singular anachronism, the balcony, so placed that no one can enter it or use it—a feature dear to the suburban designer, and wholly inexplicable. The house door now very generally contains more glass than woodwork, but the "blocked column" is happily rare.

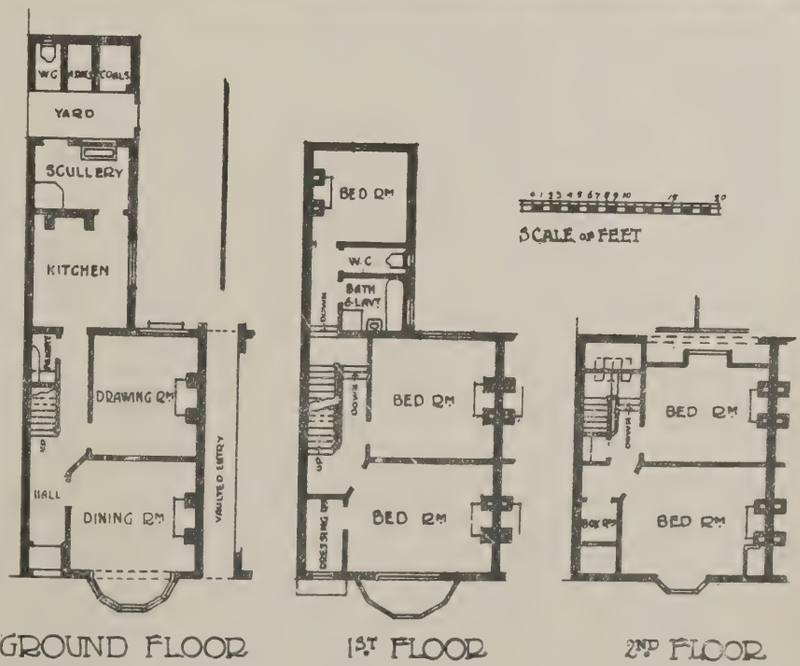
One very modern change is much to be regretted; this is the too lavish use of white paint; if allowable for woodwork, it is a complete mistake to apply it to stone, and especially to stone which time has begun to mellow. The very latest fashion seems to be without rhyme or reason: most of the houses are approached by a small space, almost too small to be called a garden, but wide enough for a few shrubs. It is remarkable how very carefully these are cared for and kept in order. Perhaps the American word "parking" best applies to them, and they invariably soften and improve the vista. It is amazing, therefore, to find that the gate piers, usually of red brick with stone caps, are being coated with coarse rubble, and in such a way as to conceal all their mouldings and details.

But the villa is no longer universal: large blocks of flats appear in parts, and the inevitable cupola, with the usual awkward addition of a flagstaff. Municipalism is represented by the immense electrical works with giant chimneys, and a yard stretching from West End Lane to Finchley Road. This is bounded by a red-brick wall and shrubs, the latter protected towards the street by a dwarf wall, in the same material. The other side of the road is occupied by the well-known cricket ground, a beautiful oasis which refreshes and enlivens the whole neighbourhood.

Views and Reviews.

House Painting: and a Purple Patch.

The well-marked tendency of wielders of the brush to indulge in more or less highly coloured rhetoric is fully sustained in the letterpress in this handbook on "House Painting." In the preface, for example, the author lays about him in language like this: "Paint is a necessity; it is an economy; it is a means of sanitation; it helps us to keep clean; it keeps us warm in winter and dry in summer; it brings light into dark corners; it beautifies our homes; it increases our credit; it raises our assessments; the most ignorant enjoy its benefits; and the most highly developed minds, whose culture is so profound that they have forgotten all they ever learned at college, retain its appreciation. A subject so various in its uses, so universal in its appreciation, deserves attention—indeed, merits intelligent study." One misses the natural sequel, "Loud cheers." It is only fair to the author to state that it is only in the preface that he waxes so floridly eloquent. Elsewhere we have observed no purple patches. In the text he settles down to steady practicality. It will be noted that this manual is expressly stated on the title-page to be "a book for the householder." It nevertheless includes a good deal of information that the architect and the craftsman will not despise, though they will hardly relish this somewhat unprofessional appeal to the layman.



House Painting, Glazing, Paper Hanging, and Whitewashing. A Book for the Householder. By Alvah Horton Sabin, M.S. New York: John Wiley and Sons. London: Chapman and Hall, Ltd. 12mo, v. + 121 pages. Cloth, $1.00 (4s. 6d. net).

The Complete Plumber.

The fifth volume of this encyclopædic work comprises a section in electrical lighting and heating, by H. D. Wilkinson and Frank Broadbent, and a section on hot-water and steam warming apparatus, by Francis William Raynes. The sixth volume, which apparently brings the work to a conclusion, contains four sections, dealing respectively with gasfitting, by J. D. Somerville; glazing, by J. Eustace Salisbury; specifications, quantities, and estimates for plumbers' work, external and internal, by W. E. Davis; and shop management and bookkeeping, by Alfred C. Beal. There are also four appendices, dealing severally with water supply; trade lists of metal sheets, tubes, etc.; tables and mensuration; and temperature. A fairly copious index to the entire series of volumes completes a work that, from first to last, reflects great credit on the editor, and on the sixteen specialist contributors who have enabled him to bring a rather ambitious project to a successful issue. This is perhaps the first really adequate representation of the multifarious and complicated details that, in the aggregate, make up the whole duty of the plumber and sanitary engineer, and it is also the most substantial manifestation of the practical side of sanitary science. Its value can hardly be exaggerated.

The Modern Plumber and Sanitary Engineer. Treating of Plumbing, Sanitary Work, Ventilation, Heating (Electric and Other), Hot-water Supplies, Gas-fitting, Electric Lighting, Bell-work, Painting, etc. By sixteen Specialist Contributors, under the editorship of G. Lister Sutcliffe, A.R.I.B.A., M.R.S.I. With Appendices of Tables, Memoranda, Mensuration, etc. Illustrated with about eleven hundred figures in the text, and about fifty plates, many of them in colour. Divisional Vols. V. and VI. London: The Gresham Publishing Company, 34, Southampton Street, Strand, W.C.

PAIR OF HOUSES, ERDINGTON. BERNARD A. PORTER, ARCHITECT.

In this pair of houses, erected on a cramped site in Arthur Road, Erdington, the entire front is covered with roughcast and coloured with the exception of the plinth, chimney, quoins and arches, which are of two-inch Staffordshire brindle bricks, with white mortar joints. The roofs are covered with red-brown tiles. Messrs. J. & E. Baker, of Aston Manor, are the builders, and the architect is Mr. Bernard A. Porter, of Colmore Row, Birmingham.

Correspondence.

The Architectural Profession To-day.

To the Editor of THE BUILDERS' JOURNAL

SIR,—You invite comments on your article, "The Architectural Profession of To-day," and suggestions for remedying the lack of employment which I understand exists in the profession. As to the position of assistants, it appears to me that one of the chief causes is that the architect of to-day has found the elaborate drawings which used to be prepared for the bedazzlement of his client are, if not unnecessary, at least a source of expense which he will do his best to eliminate, and that a drawing made in the beginning on tracing paper, from which innumerable prints can be made, serves all practical purposes. Hence in an office where five assistants had to be employed, painfully and laboriously elaborating and tracing, one assistant and an office boy can perform more work, and work, moreover, which is reasonably to be relied upon. That tracing and inking in is a thing of the past, few of us who served an apprenticeship will regret; at best it was a harassing and unhealthy occupation. You complain of the architect with more or less independent means, who you allege is likely to accept work for less than the standard rate of pay. I think the instances of this are very rare. Surely the man in this position is rather less likely to do this than the man, perhaps with wife and children to depend on him, who finds that the sole chance of his having the wherewithal to provide for them is to get another job, and that a little lowering of his fees would get it him.

I remember that the first question I was asked by my principal was: "Have you sufficient means to support yourself without it, because if not, you had better let architecture alone."

You speak of the students from the architectural schools displacing older assistants. I cannot from my own experience believe that there is much in this. Excellent as the training of some of these schools is as a preliminary to acquiring some proficiency in the art of architecture, it can be but a beginning. Having recently an opportunity of employing an assistant, I interviewed some of these young gentlemen; perhaps the remuneration I could afford to offer did not attract the best, but in those I saw the pertness with which they gave me to understand that they, with three years' paper experience, could improve on my humble efforts, did not encourage me to suppose that they would be any improvement on the more old-fashioned, if less "trained," "assistant."

It seems to me that the profession is itself somewhat to blame for its depressed state; our employment depends very largely on the confidence of men who have made their money in business. Whether simply as employers or jointly as committees, they require, in the first place, men who know their business to their finger tips; who understand what they call practical details— how to get value for their money is what it really amounts to.

What can such men think of a profession which allows its students, after a four years' course and an examination in theory, to call themselves proficient, and would, if it could, allow them to register themselves, to the exclusion of men who were building twenty years ago.

Then, look what a business man must think of architectural competitions; 20 to 100 men are willing to do half the work necessary for carrying out a building, wasting a fortnight to six weeks, for the bare 20th or 100th part of a chance of perhaps carrying out the job, or securing paltry premiums amounting to perhaps 1-10th per cent. of the proposed contract. What should we think of a doctor or lawyer who spent six weeks on a Limerick competition, with a good deal more chance of getting something out of it, than there is for the whole of the competitors in four out of five architectural competitions?

You ask for remedies; frankly, I have none. Building is only required in times of increasing prosperity, and Architecture only by the educated building owners. The country has had its good time; and though there may be another increase in prosperity, it must be of a milder nature compared to the rise between 1887 and 1900. What chance there is of the general public becoming more educated in matters architectural; you know better than I; but my experience of education is that it is becoming more commercial and scientific rather than more artistic.

Two hopeful signs I believe I see in that the employer is beginning to realise that it is a good thing to have his architect somewhere near his building, and that instead of being left to the clerk of the works and the quantity surveyor, it is desirable, if the artistic side of a building is of any value, that the architect should personally be in pretty close touch with it, and this should mean the employment of a larger number of architects, though it may mean a sacrifice of the incomes of a few for the advantage of the many. The second is that the London County Council Hall Competition put a good-sized nail in the coffin of architectural competitions, and this should be an all round saving.—Yours faithfully,

A STRUGGLER.

Farnham.

[Our correspondent is entitled to his gospel of pessimism, but not to do us an injustice. It has been no part of our case that the architect with private means does, or is likely to, accept less than the standard rate of fees; on the contrary, he is in a position to pick and choose his clients. Our complaint is that the increasing number of moneyed men taking up the profession of architecture is making things very difficult for those men who look to their work to provide them with a living. Moreover, many of these men are little more than travellers, whose golfing week-ends commence on Thursday and end on Tuesday; and the major part of the work appearing in their names is done by their assistants. If registration was in force, it would be necessary for such men to undergo a systematic course of training, followed by examinations, and the number of dilletante architects would, probably, be very largely reduced. We think our correspondent unduly hard upon the modern schools; the curricula of most of them provides or insists on practical office experience as a part of the set course. The evil is the want of thorough general education; education that makes for the strengthening and developing of character rather than the evolution of merely material instincts. Unfortunately, the world, at present, inclines to the egotist and the mountebank, and as long as it couples high ideals with an empty pocket, our correspondent may expect pertness and "cocksureness" in the budding architect.—ED. B.J.]

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I am sure architects must have read with the greatest interest your article entitled, "The Architectural Profession of To-day." Certainly, the more the subject is properly ventilated the better, and this your article accomplishes in a very able manner. Carried out on these lines, I think we may reasonably hope that the series of articles may play a great part in turning the tide.

Probably the cause of depression lies chiefly in the attitude of the public towards the profession. It is a truism to say that architects are not thought much of by the public as a body. The truth of this is brought home to architects by many a client, whose interference on expert matters amounts to nothing less than impertinence. However, if the architectural profession apply themselves resolutely to adjust matters within their control, it is more than likely that public opinion will have an improving tendency.

Why should we not take a hint from the numerous gatherings held in London lately, and have a Congress of Architects? We could invite delegates from the colonies and foreign countries, etc. An immense amount of new life and activity might thus be created, and the various papers read would contain the best and weightiest opinions obtainable. Also, people would be brought together, and union is needed now more than any time to avert what is speedily becoming a crisis. The sale of tickets and programmes, etc., would provide a fund to finance the measures of reform decided upon.

It would be useful surely for a census of the profession to be made in the manner of other professions. We should then have the statistics and facts of the case to work upon.

It might also be well to institute a form of temporary registration, and eliminate those who do not really belong to the profession. The names of registered architects and assistants would be published. Each member would have a vote, and the executive would be elected by members. Various prominent men would be asked to become patrons. The profession could be placed on a business footing, and when it had taken its proper place among other professions, Parliamentary protection would be sought. The problem of the retention of architectural work for architects could be solved.

One or two immediate temporary measures would be of immense service until the above movements were realised; and I would suggest that a society for taking up law cases on behalf of architects would be an invaluable benefit. I suppose the amount of money owed to architects, which there is no likelihood will ever be paid, would, in the aggregate, amount to an enormous sum. Working for reduced commission and speculative work would be vastly diminished.

Another useful temporary measure would be the formation of an agency for providing some sort of home employment for those who are out of work, to help them to tide over till they could find employment. Doubtless in many cases it is a time of great stress. If the work

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

THE
GRAMMAR SCHOOL
AT LE MOYNE

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

were, say, some craft, the agency would dispose of the articles made. If only a little money resulted, it would still be a help.

There are numerous other points I should like to have touched upon did space permit.

"REGULAR READER."

Biggleswade.

["Regular Reader" has, perhaps, forgotten the International Congress of Architects, held every second year. In 1906 it met in London, and this year at Vienna. This would be too cosmopolitan in character for the discussion of the economic conditions of British architects. Probably a congress held every year in the United Kingdom might effect some improvement; but improvement depends on union, which is strength, and as long as the egotistical pride of some members of the profession bars the way, this consummation, devoutly to be wished, is hardly likely to be realised.—ED. B.J.]

To the Editor of THE BUILDERS' JOURNAL.

SIR,—If your columns are not open for discussing the merits or demerits of Socialism as bearing on the present depression, why put in "A Young Architect's" letter at all?

Many of us older architects know that a variety of reasons are the cause of the trouble, but the fear of Socialism (right or wrong) is certainly one of them, driving as it does money out of the country, which would otherwise have been spent here. But perhaps the two most powerful causes are—(1) the exacting conditions and regulations (right or wrong) of the various County Councils and local authorities, and (2) the autocratic tendency (right or wrong) of trades unions in fostering mediocrity at a high wage, instead of nursing high-minded individual freedom of effort.

AN ARCHITECT OF MANY YEARS' STANDING.

London.

[We have no objection to correspondents recording their belief that Socialism would or would not be beneficial to architects and architecture. But we are discussing the present state of distress among architects, and we do not intend that discussion to degenerate into a wrangle as to what are or are not the tenets of Socialism; and every discussion into which Socialism is obtruded usually ends in this manner.—ED. B.J.]

To the Editor of THE BUILDERS' JOURNAL.

SIR,—You are quite mistaken as to the number of explanations of Socialism. There is only one, as both H. G. Wells and Jack Williams would tell you. That one your correspondent has already given you concisely: "the social control of social necessities," and in this lies the only solution, as he says, of all unemployment. You are a specialist in building, and you are "not convinced," simply because you have not studied specially the subject of social evolution.

A. M.

Dundee.

[The impertinence of our fellow-countryman's epistle we attribute to "rash and impetuous youth." As a matter of fact, the study of social questions has been a hobby of ours for many years past. That the public is "the slave of phrases" is a mere truism; we could match our correspondent's with others. "The social control of social necessities" has an unctuous flavour. It likes us well. But!—well, we could take A. M. to logical lengths in "the social control of social necessities" from which even he would recoil. Does our correspondent really believe that great art is produced by battalions? — ED. B.J.]

Contractors and Reinforced Concrete.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In your issue of September 16th, you have an article on "Contractors and Reinforced Concrete." You say:—"Architects and engineers have begun to recognise the absolute necessity for great care and *adequate knowledge* in reinforced concrete construction," and "so much depends upon the *reinforcements being in the proper position to ensure the work being of the strength designed*, that the carelessness of the ordinary workman cannot be tolerated." In these two quotations you go to the weak spots of some reinforced concrete work. We would especially draw your readers' attention to the second of the quotations. "Carelessness of the ordinary workman" is most difficult to avoid invariably. Concrete has to be put in and consolidated. In the very action by any workman, good or bad, rods and other reinforcements that are not rigid run a great risk of being displaced from the positions the drawings represent as being needed by the calculations. Hence it should be borne in mind that the rods, bars, hoops, stirrups, etc., should be built together with such rigidity and exactness that the *concrete cannot* displace them, however "careless" a workman may be. The displacement of the reinforcements is one of the causes of failures, and rigidity of construction avoids it.

CHAS. HEATHCOTE AND SONS.

London, E.C.

Our Plate.

This school takes the place of the old Aylesbury Grammar School, dating from the seventeenth century, and now the home of the Bucks County Museum. The new buildings, providing accommodation for 150 boys and girls, are situated on an exceptionally fine site in the Walton Road. Local materials have been employed as far as possible, the exterior being faced with local red stocks, and the roofs covered with Broseley tiles. The internal decorations have been successfully carried out with Mander's green stain to the wood work, and the walls treated with the same firm's distempers. A feature has been made of the central hall, which is finished with a bold modillioned plaster cornice and deep frieze. The original tablet has been taken from the old school and placed in this room, together with a new one commemorating the erection of the new buildings. The general contractors are Messrs. Hocksley Brothers, of Wellingborough. The heating was carried out by Messrs. Musgrove, of London, the lighting by Messrs. Stott and Co. The total cost was £7,500, including the master's house. The plans, selected in competition, were prepared by Mr. Fred Taylor, A.R.I.B.A., of Aylesbury.

The architect of the new wing to Bishop's Stortford College is Mr. H. G. Ibberson, F.R.I.B.A., of London. The foundation stone of the new building was laid on September 26th.

Proposed New Works.

The Local Government Board have decided to hold, or have recently held, as the respective dates indicate, inquiries into proposed expenditure by public bodies as follows:—Water supply works and plant: Beaminster R.D.C., additional amount (September 23); Pentybont R.D.C., £2,700, for Middle Llangonoyd (September 23), £12,832 for Higher Coychurch, and £3,668 for Pencoyd (September 22); Skipton R.D.C., £600 for Appletreewick (September 25); Poole B.C., £400 for Broadstone (September 24).—Bridge construction and widenings: Beckenham U.D.C., £1,100 for widening railway bridge crossing Blakeney Road (September 22); Maidenhead B.C., £300 for footbridge over railway (September 24).—Electric light and power supply works and plant: Beckenham U.D.C., £1,750 (September 22); Elland U.D.C., £3,000 (including refuse destructor purposes) (September 23).—Sewerage, drainage tnd sewage disposal works and plant.—Burnley R.D.C., £3,800 for Worsthorne with Hurstwood (September 22); Heaton Norris U.D.C., £1,500 (September 25); Fishguard U.D.C., £1,200 (September 24); Morley B.C., £370 (September 22); Bridport R.D.C., £1,500 for Bothenhampton (September 22)); Poole B.C., £447 for Branksome (September 24); Braintree U.D.C., £6,500 (September 25); Risca U.D.C., £13,000 (Sept. 25); Southampton B.C., £790 (September 25); Springhead U.D.C., £17,000 (September 23); Friern Barnet, £2,400 (September 23); Farsley U.D.C., £500 for Wood Nook (September 22).—Street improvements, new roads, public walks, and pleasure grounds: Poole B.C., £1,412 (September 24); Risca U.D.C., £2,841 and £959 (September 25).—Various: Maidenhead B.C., £950 for subway under railway (September '24); Rochdale B.C., £8,500 for public baths (September 22); Bootle B.C., cemetery (September 23); Liverpool C.C., housing, £48,870 (September 27).

Amble, Northumberland.—The Northumberland County Council has applied for a loan of £3,513, £575 of which is for the land, to build a new elementary school, and a Local Government Board inquiry has been held.

Belfast.—Plans are being prepared for the extension of the Municipal Technical Institute.

Booth.—The proposal of the Corporation to erect a smallpox hospital in Maghull is being strongly opposed by the inhabitants there. A Local Government inquiry was held on the 22nd.

Bradford.—Five blocks of tenements, to house 432 persons, are to be erected on the cleared slum area at Longlands. Tenders are to be invited immediately by the Housing Sub-Commitee of the Corporation.

Chichester.—The City Council have purchased a site for new elementary schools, in Orchard Street, at a cost of £1,350.

Christchurch, Hants.—The L.G. Board have approved plans for the new infirmary, subject to certain modifications in the details to save cost, and the Board of Guardians have been requested to furnish a further estimate.

Creswell, Derbyshire.—The parishioners have requested the County Council to consider the advisability of erecting a new school. The cost is estimated at £8,000.

Folkestone.—Mr. Carnegie has expressed his willingness to give £5,000 towards a new library at Folkestone, on condition that there are no loan charges for land to be defrayed out of the penny library rate.

Gloucester.—It is proposed to form a side chapel at St. Paul's Church, by enclosing the north choir aisle with two oak screens at a cost of £100.

Guildford.—It has been decided by the Board of Guardians to erect a nurses' home at the infirmary. Accommodation is to be provided for the superintendent nurses, eleven nurses, and two ward-maids. The staff at present occupies uncomfortable and unsuitable quarters in the infirmary buildings, and when the staff is housed in its new home there will be room for 30 more inmates in the infirmary.

Harrogate.—The Town Council have approved plans for the following:—Mr. D. Simpson, plan for alterations and additions at 19, York Road; the Duchy of Lancaster, plan for extension of sewer at rear of Kent Road; Mesrs. Raworth Bros., plan for house at Norfolk Road (Plot 30); Messrs. Raworth Bros., plan for house at Leeds Road (Plot 31); Mr. D. Sayner, plan for 23 cottages at Birch Grove; Dr. Crawford Watson, plan for alterations to "Fawdington," Ripon Road: Mr. A. Wigglesworth, plan for packing shed to laundry at Forest Lane, Starbeck.

Hull.—It is proposed to build two new Wesleyan mission halls at a cost of £23,000. These will be built in Great Thornton Street and Scott Street respectively, and will be of a similar size to the existing Wesleyan Queen's Hall.

Keighley, Yorks.—The Town Council have approved plans for the following:—Mr. Rhodes Grace, additions, Gale Street; Mr. C. Hird, six new streets, Broomfield Estate; Messrs. Timothy Hird and Sons, shed, South Street; Messrs. Verity and Shuttleworth, workshop, Strawberry Street.

Mountain Ash.—Lady Aberdare has undertaken to enlarge the cottage hospital and build an operating theatre.

Newport, Mon.—The Wesleyan Connexional Chapel is to be restored after fire at a cost of £1,086.

Nottingham.—The City architect has prepared plans for extending the City Lunatic Asylum, at a cost of £10,800. The proposed works provide for the extension of the infirmary block on the female side to accommodate 43 patients, and for a separate block to be erected to accommodate 40 chronic cases in males.

Nottingham.—The City Council have purchased 48 acres of ground on Wilford Hills for the purpose of a southern cemetery. Three acres are to be given up for a reservoir in connection with the city waterworks; an area of 23½ acres is to be laid out immediately for cemetery purposes, according to plans prepared by the city architect, leaving 21½ acres for future extension. The work is estimated to cost £22,000, and includes the provision of two chapels, with a crematorium, mortuary and lavatories, two lodges with the necessary offices, entrance gates and fencing, the formation of carriage drives and paths, and the levelling, planting, etc.

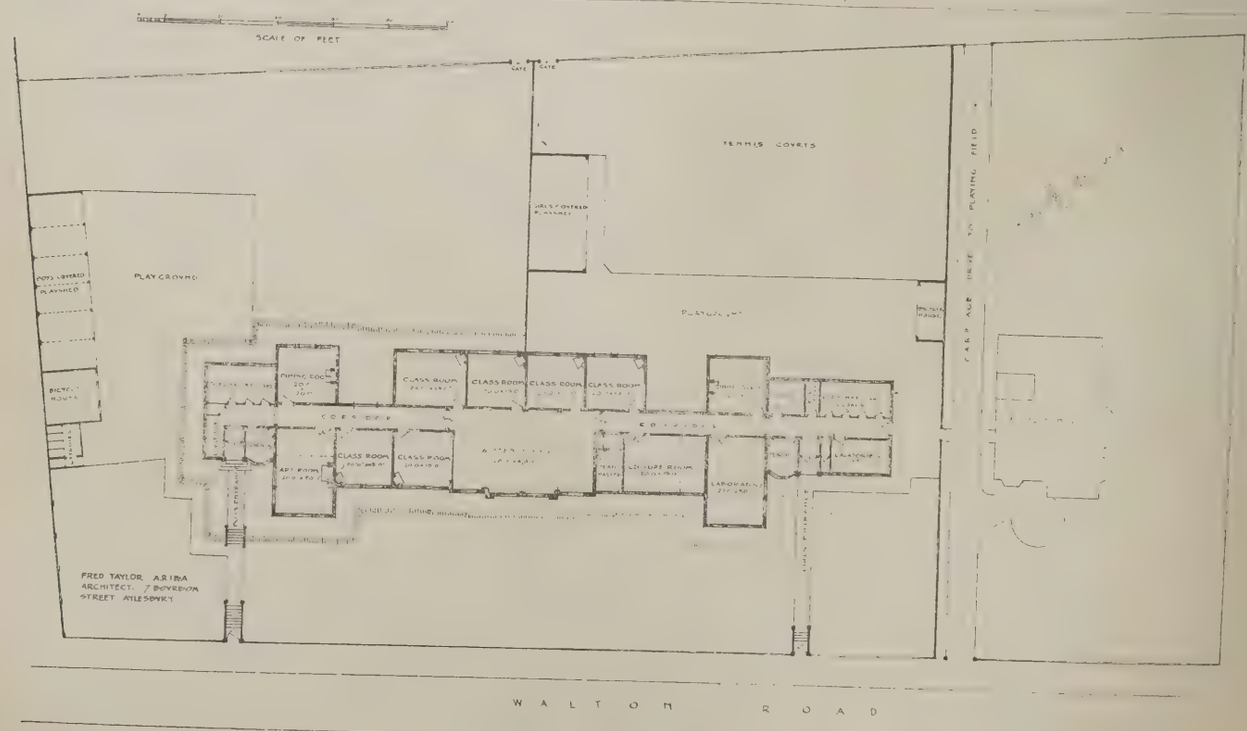
Penrith.—The Town Council have approved plans for the following:— Co-operative Society, shop, etc., Burrowgate; Mr. T. L. Main; addition to house, Lonsdale Terrace.

Rishton, Lancs.—The District Council has approved the following plans:—Bakehouse, 57, High Street, for Miss Hothersall; amended building line of shop in Cliff Street for Co-operative Society; and alterations at rear of 92, High Street, for Mr. J. T. Proctor.

Rochdale.—The L.G. Board have held an inquiry into the application of the Town Council to borrow £8,500 to build public baths at Castleton.

Rosyth.—The Garden City Association is agitating for the erection of a garden city at Rosyth, as houses will be required for the workmen at the new naval dockyard, when this is completed. Meetings in support of the idea will be held during the autumn; and the Carnegie Dunfermline Trust, though not disposed at present to take definite action, are sympathetically inclined to the project.

Scarborough.—The Corporation is considering the erection of a destructor on a site in Seamer Road.



Watford.—Extra vagrant accommodation is to be provided at the Union workhouse; the plans have been passed by the U.D. Council.

Winslow, Bucks.—The Rural Council has passed plans for proposed new schools and headmaster's house, at Botolph, Claydon.

Wootton, I.W.—Mr. Percy G. Stone, F.R.I.B.A., F.S.A., is preparing plans for a new church, to seat 250 people, and for a parish room.

Walsall.—The Town Council has approved plans for the following:—D. E. Parry, 4 houses, Sneyd Lane, Bloxwich; Jesse Wootton, house and shop, West Street, Leamore; G. Pedley, two workshops, 136, Wolverhampton Road; W. H. Cooper, one house, Dale Street; Vicar and Churchwardens, vestry and porch, St. John's Church, The Pleck.

Swanage.—The U.D. Council have approved plans for the following:—Parsons and Hayter, house on Swanage Bay Estate; H. and J. Hardy, house in Rempstone Road; H. J. Smith, house on Hedes Estate; John Parsons, amended plan for house in Cliff Avenue; Parsons and Hayter, convenience at Anchor Hotel; H. J. Smith, bicycle shed, etc., in Victoria Avenue; Mrs. Hooke, shed at Highcliffe.

AYLESBURY GRAMMAR SCHOOL: GROUND PLAN. FRED TAYLOR, A.R.I.B.A., ARCHITECT

(*See Centre Plate.*)

Buildings in Progress and Completed.

Axminster.—The new post-office, which has just been opened, is situated on the north side of Trinity Square, and is a commanding structure. It has a frontage of 45ft., and rises to a height of 40ft. above the pavement. The lower portion of the front elevation is built in square ashlar walling of local blue stone with Ham Hill stone dressings. This is surmounted with a Ham Hill stone cornice. The upper portion is built in brick covered with rough-cast. The interior comprises three floors and a basement. The ground floor contains public offices, 21ft. by 15ft., a sorting office 40ft. long by 30ft. wide in the widest part, private office for postmen, and large lobby for the reception of the mails. The first floor contains the Postmaster's private office, instrument-room for receiving and dispatching telegrams and cablegrams, telephone-room for the future telephone exchange, men's room, women's room, and messenger boys' room. On the second floor there are two large store-rooms, and excellent quarters for the caretaker, which contain sitting-room, bedroom, kitchen, and pantry. The builder was Mr. R. G. Spillar, of Chard, and the architects were Messrs. Symes and Madge, of Axminster and Chard.

Beverley.—The sculpture of the west portal of the Minster, comprising 37 figures, has just been completed by Mr. Robert Smith. The figure of St. John the Evangelist, the patron saint, in the central niche, was presented by Mr. and Mrs. Thomson several years ago. Immediately below the west window are twelve niches. As the Twelve Apostles, with the seated figure of our Lord in the centre, have already been placed in the north porch, figures of the Twelve Patriarchs were inserted in these niches, and the other twenty-four niches have been filled with Old Testament saints and worthies. Beginning with the lowest range of four niches are the figures of Adam, as the gardener, with his spade, and Eve with her distaff; Noah holding the model of the Ark; and Abraham, arrested by the voice of God, when about to sacrifice his son; the ram appearing below, his horns entangled in a thicket. In the middle tier are Moses, with the Tables of the Law; Aaron, in the robes of the High Priest, holding the budding almond rod; David, with his harp; Solomon, with the plan of the Temple; Isaiah, holding a pen, and his prophetic scroll; and Daniel, with a lion at his feet. In the upper row, the Twelve Patriarchs appear, each with his distinctive emblem. "Unstable Reuben," a sword in his right hand, and an olive branch in his left, wavers between thoughts of peace and war; Simeon bears the "instrument of cruelty"; Levi, the father of the priestly tribe, displays mitre and censer; Judah, the progenitor of the royal tribe, is crowned and sceptred, and the lion crouches at his side; Zebulon, dwelling "at the haven of the sea," carries the model of a primitive ship; Issachar, of the peace-loving agricultural tribe, carries sickle and mattock; a field of corn appears in the background, and a lamb by his side. The warlike Gad is armed with a spear; Dan, the judge, holds a pair of scales, and a serpent lies at his feet; Asher is crowned with a chaplet of olive, and bears a sheaf of corn, emblematic of the fertility of his land; Naphthali is denoted by the hind at his side; Joseph by the fruitful vine; and the youthful Benjamin by a wolf.

Birmingham.—The new University Buildings, of which Sir Aston Webb, R.A., and Mr. E. Ingress Bell are the architects, are gradually approaching completion. The great hall is now finished, and the clock tower, some 30ft. square, has now risen to a height of 200 ft. out of the 325ft. which it will reach when completed. The clock, which is being presented by the contractor, Mr. Rowbotham, will be placed at the present level of the tower, and will have four dials, 17ft in diameter, with minute hands 8ft. 6ins. long. This is being made by Messrs. J. B. Joyce and Co., of Whitchurch, Salop. The Harding Memorial Library is finished outside; also the physics block, though much yet remains to complete the interiors of both. The chemistry block is proceeding but slowly at present, and one or two connecting blocks have yet to be started. The materials are Accrington bricks and Darley Dale stone, and the elevations, so far as embellishment goes, are plain, effect being sought in scale and mass rather than in sculpture and ornament.

Bradford.—Mr. Albert Halliday, of Baildon, has been entrusted with the design of the wrought iron balconies for the Town Hall extensions.

Camborne.—The new county school for girls erected from the designs of Mr. Sampson Hill, of Redruth, is now completed. The building is faced with Burhos pink elvan and granite dressings. The general arrangement of the school is on the central hall system. The hall is a well-proportioned room, with a gallery occupying three sides; the ceiling is segmental, with pitchpine moulds. The pupils' entrance opens on to the outer hall, on the right of which is a corridor leading to the sanitary offices, which are spacious and fitted with modern appliances. There is also a large cloak-room. Broad easy stairs lead to the upper gallery. The ground floor classrooms open on to the assembly hall, and the upstairs room to the gallery. The art room is on the first floor with the science room below. The upper storey is floored with reinforced concrete, which enables the whole of the rooms to have wood block floors, rendering them noiseless in use, and adding much to their safety. The walls are plastered throughout with "granite" plaster; the face of this plaster is perfectly hard and smooth, and is finished in a warm tint, having a comfortable and artistic effect. Accommodation is provided for 150 pupils. Careful attention has been paid to the ventilation and heating, the latter being by hot water, installed by Messrs. Alger and Sons, of Newport. The ventilation is by exhaust tubes leading to a turret placed over the central hall. It is intended to use an existing building for a dining hall. This will be fitted up forthwith. The whole of the contract has been carried out by Messrs. Mitchell and Bond, of Camborne, for the masonry, and Mr. W. C. Hodge, of Redruth, for the carpentry and joinery, Messrs. Tyack, of Camborne, doing the plumbing.

Darwen.—The extension of St. Cuthbert's Church has now been completed. A new tower has been added, 105ft. high, in Runcorn stone, to match the older portion of the building, and extensive alterations and improvements effected in the interior. A new carved oak screen, 23ft. high, has been erected at the chancel arch, new carved oak choir stalls installed, and new oak pews throughout. The floors have been relaid with Terralith and the chancel tiled with Marm marble. The plastered work has been treated with Walpamur, and the chancel walls hung with handpainted paper of lily design, the prevailing tone being soft green. The organ has been moved from the south transept to the north choir aisle, and a new heating system has been installed. The contractors for the building were Messrs. Lloyd and Millward; Messrs. Jas. Hatch and Sons, of Lancaster, executed the screen, pews, and choir-stalls; Messrs. Lloyd and Millward carried out the smaller screens and oak work to vestibules, etc.; Mr. E. Wrighton executed the plumbing; Mr. W. V. Fairhurst, the electric lighting; and the decorating has been executed by Mr. W. Bentley.

Dundee.—A new pavilion for diphtheria patients is being added to the King's Cross Hospital. Mr. Bennett is the builder.

Edinburgh.—The College of Art buildings, which are being erected from the designs of Mr. J. M. Dick Peddie, will be completed by the end of the year.

Edinburgh.—New engineering laboratories for the Heriot-Watt College were opened by Lord Rosebery on September 16th. The new buildings, on one floor, comprise wood workshop, 1,450 sq. ft.; engineering workshop, 1,700 sq. ft.; engineering laboratory, 4,400 sq. ft.; applied mechanics laboratory, 2,000 sq. ft.; strength of materials laboratory, 1,360 sq. ft.; smithy, 740 sq. ft.; motor pit, 375 sq. ft.; and the interior walls are faced with glazed bricks. The roofs are of steelwork, with patent glazing, wired glass being used. The floors are laid with pitch-pine blocks, except the motor and boiler pits, which are laid with concrete, and the motor pit with blue bricks. The cost of the buildings is £9,000, exclusive of the site. The general contractor was Mr. Colin Macandrew. Heating on the low-pressure steam principle has been installed by Messrs. Ritchie and Co. The plans were prepared by Mr. John Anderson, superintendent of works to George Heriot's Trust, while Mr. George Ballingall has acted as clerk of works.

Edinburgh.—The new premises of the Edinburgh Life Assurance Co., rapidly approaching completion, have been designed by Mr. J. M. Dick Peddie. The building, in the Renaissance style, is situated at the corner of George and Hanover Streets, the corner feature being a dome rising to a height of 100ft. The façade is of Portland stone on a base of grey unpolised granite five feet high, and is the first in Edinburgh to be erected of Portland stone, which was shipped from the quarries direct to Leith, and worked in Edinburgh. The building is constructed throughout with steel stanchions and floors of reinforced concrete. The drum of the dome is made of steel and concrete, and the dome itself is covered with copper. The Company's entrance is from George Street, and the pediment above the doorway contains a representation from the Company's coat-of-arms. The main office, which measures 54ft. by 45ft., has fine marble columns and mahogany fittings. The secretary's room and the manager's room are mahogany panelled and furnished with marble fireplaces, while the Board room is a handsome chamber, mahogany panelled, and

hung with the fine figured Utrecht velvet which adorned the old premises. The marble fire-place is a work of great beauty. The typewriters' room is in the basement, where the noise will cause no annoyance; and here, too, are several apartments and strong rooms for the safe custody of important documents. Special attention has been given to heating and ventilation.

Hornsea, Lincs.—A new holiday home for the Hull Guild of Braves is being erected. The building, designed by Messrs. Runton and Barry, is intended for cripples, and is therefore on one floor, except the front portion, where bedrooms, bath-room, etc., for the ladies in charge, have been arranged. The accommodation comprises four wards, a large dining-room, a sitting-room, bathroom, and offices. The site cost £264, and the contract has been let to Mr. Levitt at £1,200.

Kirkcaldy.—A new school erected by the Dysart School Board in Loughborough Road has been opened. The new school, a one-storey building, is a very pleasing structure in the modern Renaissance style. Besides ten ordinary class-rooms, provision is made for cookery and laundry work. There are also chemistry and physics laboratories with dark rooms, and a manual instruction room. A large airy central hall, measuring 66ft. by 30ft., with corridors to the side wings of the buildings, is a prominent feature, and there is also a well-arranged art room; provision being made for the teaching of technical drawing such as building construction and engineering. The heating is by the low-pressure hot water system, while the ventilation is by three extract fans. The building is lit by electricity. The front of the building is relieved by some sculpture by Mr. A. Murdoch, Kirkcaldy. Mr. D. Forbes Smith, Kirkcaldy, is the architect. The following are the contractors:—Mason, David Wallace, Pathhead; joiners, Bogie and Nicol, Kirkcaldy; plumber, James Robb, Dysart; plasterer, Alexander Hutcheson, Kirkcaldy; slater, William Currie; tile work, Field and Allan, Edinburgh; glazier, Dickson and Walker, Edinburgh; smith work, James Lessels, Dunfermline; heating, Charles Ritchie and Co., Edinburgh; furniture, Bennett Furnishing Company, Glasgow.

Lancaster.—The new Grand Theatre, built from the designs of Mr. Albert Winstanley, was opened on the 14th instant. Only the outer walls were left after the fire which destroyed the former structure, the Athenæum Theatre, and these have been strengthened and renewed where necessary. The new building seats 1,000 people, there being an area, divided into stalls, pit stalls, and pit, with one gallery for grand and upper circle, and two boxes. The proscenium has been widened to 22ft., and the general decorations, in fibrous plaster, are carried out in a colour scheme of cerise, cream and gold.

Leeds.—The foundation stone of a new Baptist school in Cardigan Road, to which a church will be added later, was laid on the 19th instant. This is part of an extension scheme for the whole city. The building is to be of brick, with stone dressings, and will comprise an institute, gymnasium, and reading rooms for young men and women, as well as the school. The cost of the whole scheme is £8,000, of which the school portion will absorb £4,000. Messrs. Percy Robinson and W. Alban Jones are the architects.

Liversedge, Yorks.—New day and Sunday schools for Robertstown Church have been erected at a cost of £780.

Lochee.—A parish hall in connection with St. Luke's Church, to seat 650 people, has been erected at a cost of £1,200, from the designs of Mr. Leslie Owen, of Dundee. The contractors were—Mason work, Mr. Bruce, Lochee; joiner, Mr. Andrew Davidson, Lochee; slater, Mr. Brand, Dundee; heating, Mr. Peacock, Dundee; plasterer, Mr. McRitchie, Dundee; plumber, Mr. Reoch, Lochee; painting, Mr. W. Norwell, Dundee; chairs, Messrs. East Brothers, Lochee.

London: Fulham.—The new Congregational Church erected in the Fulham Palace Road, providing sittings for over 1,000 people, has been completed with the exception of the tower. The elevations are of sandfaced bricks, with terra-cotta dressings, the roofs are covered with red Broseley tiles, and the windows have leaded lights. The architects are Messrs. Cooper and Williams, of Kettering, whose design was accepted in a limited competition. The general contractor was Mr. William Downs, of Walworth Road, S.E., Messrs. Marriott and Co., of Higham Ferrers, carried out the heating and ventilating, and Messrs. Russell and Co., of Putney, executed the electric lighting. The cost of the whole scheme when completed will be £11,000.

London: South Kensington.—The Victoria and Albert Museum extension is approaching completion, and is to be opened by the King early next year. The building, which was designed by Sir Aston Webb, R.A., and will cost £800,000, has a frontage to Cromwell Road of 700ft., and extends up Exhibition Road for over 300ft. Five domes and two minarets spring from the roof, and far above them all is the great lantern, on which is poised Professor Lanteri's colossal statue of Fame. On the façade there are 32 niches, filled with as many statues of distinguished masters in science and art, as well as many other figures, the whole representing the work of 23 sculptors. The arched doorway is the only portion of the exterior left in the hands of the workmen, and Mr. Alfred Drury's imposing statues of Queen Victoria, flanked by St. Michael and St. George, as well as Mr. Goscombe John's figures of King Edward and Queen Alexandra, at the porch, have long been finished. Immense as is the space in the galleries, there is abundant material to equip every room. The whole of the Oriental section now housed in temporary galleries behind the Imperial Institute will be transferred to the new building, as well as the largest portion of the exhibits now crowded together in the old Museum.

Manchester. — The new infirmary is rapidly approaching completion. It provides accommodation for 600 patients, and, including land and furnishing, will cost close upon £500,000. Mr. Edwin T. Hall, F.R.I.B.A., of London, is the architect.

Montrose.—The new Y.M.C.A. buildings in Murray Street, erected in stone at a cost of £2,220, were opened recently.

Newcastle: Scotswood.—New schools for the Newcastle Education Committee have been erected at the corner of Denton and Armstrong Roads to accommodate 1,080 children in three departments—senior boys and girls, junior boys and girls, and infants. The schools are built of red brick, with stone dressings. The ground floor is laid with maple wood block floring on concrete, and the first floor with maple flooring. The internal stairs are of solid oak, and the whole of the internal walls have a dado of glazed bricks. The main roofs of the schools and the caretaker's house are covered with green Welsh slates, the flat roofs to playsheds being finished in vulcanite. Each department of the schools has a large central hall from which the class-rooms open out, each class-room being arranged to have left-hand light for the scholars. The cloak-rooms and lavatories are arranged near the entrance of each department, the fittings being of the latest and most approved pattern. Rooms are provided for the teachers and head teachers, with lavatories and other necessary conveniences. The buildings are heated throughout with hot water, and are lighted with gas. A house is provided on the south side of the site between the two school blocks for the caretaker. The buildings have been erected by Messrs. Veitch and Jordan, Newcastle-on-Tyne, from the designs and under the supervision of Messrs. Watson and Curry, architects, Newcastle-on-Tyne.

Stafford.—A workmen's institute building is being erected here in connection with St. Thomas's Church. The structure, a simple red-brick building of two rooms and offices, is being erected by the workmen gratuitously, the parish being a poor one, and the funds collected are being expended in the purchase of materials.

Taunton, Somerset.—Extensions to the Taunton branch to form new head offices for Stuckey's Banking Co. have been made at the corner of Market Place and Corporation Street, from the designs of Messrs. Oatley and Laurence, of Bristol. The façade is entirely of Bath stone, and the interior fittings are of selected oak, the staircases and floors being of fire-resisting construction. The doors are particularly noticeable for the fine grain of the oak used. The new portion harmonises completely with the older portion of the pile, and in it accommodation is found for clerks, secretarial and inspectors' offices, etc., waiting-room, and a spacious room reserved for the purpose of meetings of shareholders. Several strong rooms have also been provided. The heating of the building is on the low-pressure hot-water principle, and throughout there is a complete installation of the electric light. The builders are Messrs. H. J. Spiller and Son, Taunton.

Wallsend.—The new municipal buildings in High Street were opened on the 16th instant. The new buildings include the Council chamber committee rooms, the usual departmental offices, caretaker's quarters, a police court, and fire station, and are faced with stone. The work has been carried out from the designs and under the superintendence of Messrs. Liddle and Browne, architects, Newcastle. The contractors were Messrs. W. Franklin and Sons, of Newcastle. The heating engineers were Messrs. Boyd, of Paisley. The tile work and mosaic floors were laid by Messrs. Emley and Sons, Ltd., Newcastle. The furnishing to the Council Chamber and police court was done by Messrs. Robson and Sons, Ltd., Newcastle, and the electric lighting and ventilating installations by Messrs. Siemens Bros., of Newcastle. Mr. R. B. Richley has acted as clerk of the works. The total cost, exclusive of furnishing and site, is about £14,000.

Federation News.

Northern Centre of the National Federation of Building Trade Employers (comprising the Lancashire, Cheshire, and North Wales, the Yorkshire and Northern Counties' Federations).—The half-yearly meeting of the executive council was held at the Acorn Hotel, Temple Street, Birmingham, on Tuesday, July 28th, at 6.30 p.m., when Mr. Henry Matthews, J.P., Manchester, presided over an attendance of 13 representatives from the three federations forming the centre. Mr. James Denver, Manchester, was appointed secretary for the centre in place of Mr. John Tomlison, resigned. A long discussion took place with reference to the admittance of the labourers' union to the conciliation scheme, and ultimately it was agreed to allow the matter to stand over, pending the report of the National Board, who were to reconsider the same. Several other matters of importance affecting the centre were discussed, and resolutions passed thereon, and a vote of thanks passed to the chairman for presiding brought the meeting to a close.

Northern Centre Conciliation Board for the Building Trades. — A special meeting of the above Board was held at the Grand Central Hotel, Briggate, Leeds, on September 14th, at 2.30 p.m., when Mr. T. Wilkinson, Middlesbrough, took the chair, and Mr. D. Richards, J.P., Southport (operative), took the vice-chair. Mr. James Denver, Manchester, was appointed secretary for the employers' section of the Board, in place of Mr. John Tomlison, resigned. Some correspondence was read from the Liverpool Association having reference to a complaint which had arisen under the St. Helen's boundary radius, arranged by this Board a short time ago, and after some discussion a resolution was passed thereon. The appeal from the Rochdale Local Board for an advance in joiners' wages of 1d. per hour—from 9d. to 10d.—together with a proposed alteration in the overtime rule and the extension of the discharge notice from one hour to two hours, referred back from the meeting held on June 29th last, was again down for consideration, and representatives were admitted to state their case. The evidence from both sides having been heard, several votes were taken on each of the points in dispute, but no decision could be arrived at, both sides voting equal on each occasion, so that the matter will go before the National Board according to rule. Some discussion then took place on the use of these Boards from both sides, and the meeting terminated.

Scottish Building Trades Federation. —The half-yearly meeting of the Scottish Building Trades Federation was held in the Imperial Hotel, Aberdeen, on September 18th, Mr Jas. Leslie, Aberdeen, presiding. The report of the executive for the past year was submitted, showing, that trade was in a very depressed state throughout Scotland. Reports were communicated from Aberdeen, Oban, Perth, Inverness, Hawick, Kilmarnock, Paisley, Dundee, Edinburgh, and Glasgow, and in each of these centres, without exception, it was reported that trade was very dull, and so far as could be judged there was no immediate prospect of an improvement. As regards the proposed new scaffolding regulations, the meeting had under consideration amendments which had been framed by the Scottish builders, as in many cases the regulations drawn up by the Government Departmental Committee were inapplicable to Scotland. In order that the amendments might be properly brought under the notice of Mr. Gladstone, the Home Secretary, a deputation, consisting of Mr. James Leslie, Aberdeen; ex-Bailie Farquhar, Aberdeen; and Mr. John Lonie, Edinburgh, was appointed to interview him in London on the subject. It was agreed to send a deputation, consisting of Messrs. Craig and T. C. Stokes, Dundee, and the secretary (Mr. James Cameron, Edinburgh) to Perth to stir up the local association, which was in a bad way in consequence of the depressed and stagnant state of trade in that district. It was agreed to hold the next half-yearly meeting of the Federation in Perth. The secretary read a paper on "Federation Organisation," and threw out hints which, if acted upon, would help materially to strengthen the cause of the Federation throughout Scotland. Mr. James Leslie, Aberdeen, was appointed president for the ensuing year, and Mr. Hector McVinish, Inverness, was appointed vice-president. These gentlemen were also elected representatives to the National Federation of Building Trade Employers of Great Britain and Ireland.

Sheffield.—On September 18th a representative party of the members of the Sheffield Master Builders' Association were conducted over the new Victoria Hall in Norfolk Street, which has been built by Messrs. G. Longden and Son, Ltd. The party, which included Mr. T. Eshelby, president of the association, were met at the Builders' Exchange, where the party assembled, by Mr. W. Longden, who is junior vice-president of the Association, and at the Victoria Hall they were received by Mr. Hale (the architect of the new building) and Mr. Lewtas (clerk of works), the latter of whom took charge of the party, and showed them over the building, which has cost £41,000. The chief feature is a hall capable of seating 2,000 persons. There are, in addition, a lecture-hall to accommodate 500 persons, a schoolroom for 250, and sixteen large classrooms.

South Shields. — The members of the South Shields branch were still deploring the death of one of their number, Mr. Samuel Deacon (who had been for many years an active member of the committee, and one of the honorary auditors of the branch, and who, less than a month ago, died at the early age of forty-four), when they were further shocked by the death, on September 8th, of another valuable colleague, Mr. Thomas Banks, at the age of fifty-five. For nearly a quarter of a century Mr. Banks had been a builder and contractor in South Shields, his last enterprise being on the Fairless Estate. At a meeting of the South Shields Master Builders' Association, held on September 10th, Councillor J. T. Armstrong, Mr. A. Ross, Mr. J. Moore, and other members, spoke in feeling terms of the esteem in which Mr. Banks was held and of the valuable work that during the past twenty years he had done for the Association, particularly during the year of his presidency and as a representative on the Northern Counties Federation of Building Trades Employers, as well as on the Tyne and Blyth District Federation. The funeral, at the Westoe Cemetery, on September 12th, was attended by many Freemasons, and by a large number of members of various master builders' organisations; Mr. T. Weir, president of the Tyne and Blyth Conciliation Board, represented the Northern Counties Federation, while more than thirty members of the local association were present, including Councillor J. T. Armstrong, president, and Mr. J. G. Robertson, secretary.

Trade and Craft.

The "Edwardian" Chimney-pot.

Incidental to the season for the renewal of fires in the living-room is the revival in an acute form of the perennial nuisance known to the laity as "smoky chimneys," and to the profession as "downdraught." There is still time to provide against this distressing condition, and Messrs. Mark Fawcett and Co. offer a simple and effective solution of the problem. Their "Edwardian" downdraught-preventing chimney-pot, having been patented nearly two years ago, has got far beyond its merely experimental stage. It has been widely adopted in actual practice, and its makers are able to produce, from all parts of the kingdom, a profusion of testimonials as to its efficacy. These pots are simple in construction, and of artistic appearance. The pot proper is a hollow truncated cone, and, supported above it, on triangular legs, like an inverted canopy, is a dished cover. A descending current striking the cover on the windward side follows the curve of the dish and rises on the lee side, the thick rim to the cover preventing the current from striking under the dish and being led into the pot, as would happen with a thin rim. The dish has a flat soffit, allowing the wind to blow clean through horizontally. Thus, the thick rim to the cover acts as a baffler on the windward side, and as a "lull" on the lee side. The legs supporting the cover are of triangular section, and hence they act as bafflers on the windward side, while on the lee side they offer the least possible obstruction to wind and smoke. The legs rise out of the base of the pot, and turn upwards the wind that strikes on the sloping sides. The dished covers are glazed, and the rain that they prevent from entering the chimney soon evaporates under the influence of wind and heat. The pots are heavy and strong, and cannot be disturbed by the wind or by vigorous application of the sweep's brush, and they contain no crannies to harbour soot. They are made in one piece—pot, legs, and cover being integral—of ordinary red chimney-pot clay, or the same black-glazed, or of buff or salt-glazed fireclay. The makers state that frequently, in cases where ordinary pots have been fixed and found wanting, these patent pots are ordered by telegraph at the last moment before the new house is occupied, and that obviously it would be in every way far better to specify the Edwardian pot at the outset. They further point out that the Edwardian pot does not get a fair chance when it is jammed in between ordinary pots or tallboys. In a stack of Edwardians, the pots are so set as to allow the wind a clean sweep through the entire range. The Edwardian pots are being largely specified for new work by leading architects, many of whom have adopted them in preference to other pots after the work had been started—as, for instance, at the artisans' dwellings built by the St. Pancras Borough Council, where 238 have been fixed; and at the Sutton's Trust dwellings,

James Street, Bethnal Green, where 413 have been used. These pots can be obtained from Messrs. Mark Fawcett and Co., 250, Queen Anne's Gate, Westminster.

A New Material: Asbestos Wood.

Calmon Asbestos and Rubber Works, Ltd., have hit upon the very ingenious expedient of combining the fire-resisting and non-conducting properties of asbestos with the appearance of ordinary wood. The fire-resisting properties of Calmon asbestos slate are well known and highly appreciated; and the proprietors have conceived the happy idea of adapting it to wider applications. Of course, the firm's asbestos sheets for ceilings and partitions can be distempered or papered like walls of ordinary plaster; but the Calmon asbestos wood presents a surface that is at once beautiful in appearance and agreeable to the touch. By a special process, veneers are immovably fixed to the asbestos slate, either on one side or on both sides, producing a material that has, of course, all the properties that render the slate valuable, with the additional merit of handsome figure and high polish, if those decorative features are desired. Asbestos wood offers, therefore, all the advantages of high-class woodwork, without its liability to take fire, or to become affected by heat or damp. It neither warps nor cracks. The firm claim that it is an ideal material for the lining of buildings, ships, and railway carriages, and for the construction of such furniture or fittings as may be required for the storage of valuables. It is worked and fitted in exactly the same way and with the same materials as ordinary wood; it can be sawn, drilled, and nailed without difficulty. Judging from the sample forwarded to us for inspection (and we are informed that similar pieces will be willingly supplied to architects and others who wish to make a practical test), we should suppose that the material would lend itself with special facility to decorative panelling. The varieties stocked comprise veneers of oak, mahogany, walnut, maple, and white wood, in sheets or panels 4ft. by 4ft. by 9/64in. thick, and 8ft. by 4ft. by 3/16in. thick. The firm's well-known asbestos fireproof sheets for partitions, ceilings, etc., as used at Messrs. Waring and Gillow's premises in Oxford Street, at the new public offices in Whitehall, and in many hospitals and other institutions where fire-resistance is of first and last importance, will no doubt continue in favour for such services; but where a handsome finish and decorative effects are required in addition to incombustibility, asbestos wood will naturally be preferred; asbestos wood being virtually asbestos slate of superior appearance and of a much wider range of adaptability. Specimens and all further particulars may be obtained from Calmon Asbestos and Rubber Works, Ltd., 1, 2, and 3, Trinity Place, Tower Hill, London, E.C., who are also manufacturers of the asbestos roofing slates.

"Xelite" Plaster.

We are given to understand that Messrs. Clark and Co.'s "Xelite" plaster was used in the construction of cottages Nos. 79 and 80, awarded the gold medal in Class B at the Walker Cottage Exhibition, held at Newcastle-on-Tyne. The cottages in question were designed by Messrs. White and Stephenson, architects, and erected by T. Clements, the cost being limited to £235.

Insurance.

Subscribers to "The Builders' Journal" are entitled to a Free Insurance for £500. Every subscriber should apply for this, sending a postcard with the name of the newsagent with whom the order has been placed. Subscribers can also obtain a General Accident and Sickness Insurance (the "Lighthouse" policy) at a reduced premium, which includes the Annual Subscription to this Journal. A pamphlet giving full particulars can be obtained free on application.

Free £500 Accident Insurance Coupons have this week been sent to the following:—

J. H. S. (Forest Hill), H. J. W. (London, W.C.), G. B. C. (London, W.C.), J. B. (Hull), F. R. P. (Blackpool), J. W. G. (Heywood), T. D. (London, N.W.), R. T. F. (Dalston), G. M. M. (Reading), E. C. Dederich, Imperial Buildings, Ludgate Circus, E.C.

William C. Clark, Ltd., capital £2,500, to acquire the business of a commission agent, general mineral merchant, builders' factor and merchant and insurance agent and broker, carried on by Mrs. Elizabeth G. Clark, at 137, Victoria Road, Darlington, as "William C. Clark." The first directors are Mrs. E. G. Clark and H. R. Gatenby.

ROBERT ADAMS' NEW INVENTION.

IMPORTANT TO ARCHITECTS & BUILDERS.

REVOLUTION in Silent Door Spring Hinges.
A New and Wonderful Floor Spring for Double and Single Action Doors.
Absolutely the Shallowest, Most Perfect, Powerful and Efficient Spring ever invented.
Half the size, Thrice the Value and Durability of others.
Its unique Sealed Check Chamber is Impervious to Water, and an immunity against oil-stained floors.
It is calculated to increase the demand for double and single action Door Springs, even more than my original celebrated and now Universally used 1870 patent Spring and Adjustable Shoe.
Such a Shallow Box as referred to above has never before been known to be practicable. It has been specially designed for the shallowest floors, to suit the exigencies of modern construction.
Robert Adams' other Specialities include New Patterns in Fanlight and other Opening Gearing, Panic Bolts, Weather and Water Bars, &c., &c.
Particulars on application to the Patentee:

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Oct. 1. PENYGRAIG.—Rebuilding two shops at Penygraig for J. T. Thomas, Emporium, Penygraig, where plans and specifications may be seen, or at the office of R. S. Griffiths, M.S.A., architect and surveyor, Tonypandy. Tenders to be delivered endorsed "Tender for Shops," by October 1.

Oct. 2. ASHFORD. — Erection of a manual training workshop at the Ashford Grammar School. Plans and specifications can be seen at the office of A. E. Lacey, A.R.I.B.A., North Street, Ashford. Tenders on form supplied, to be forwarded to Horace Hamilton, clerk, 11, Bank-street, Ashford, by 10 a.m. on October 2.

Oct. 2. BROMPTON (near Northallerton). — Alterations and additions to Brompton Council school for the education committee of the North Riding of Yorkshire county council. Plans and specifications can be seen and forms of tender obtained, at the school during ordinary school hours. Tenders to be delivered to J. C. Wrigley, secretary, county hall, Northallerton, by noon on October 2, sealed and endorsed "Tender, Brompton Alterations."

Oct. 2. NAVAN (Co. Meath).—Erection of a new national school at Navan, Co. Meath, for the sisters of mercy. Plans and specification can be inspected at the office of Thomas F. McNamara, architect, 50, Dawson Street, Dublin, between 10 and 5, Saturdays 10 and 1. Bills of quantities, prepared by James Mackey, surveyor, 58, Dame street, Dublin, and can be had from him on payment of £2. Tenders, endorsed "Tender for National Schools, Navan," to be delivered to the Very Rev. P. Farrell, Adm., Parochial House, Navan, not later than noon on October 2.

Oct. 3. MYLOR (Cornwall).—Erection of a cottage at Churchtown Farm, Mylor, in the occupation of A. N. Bath, where the plans and specification can be seen; also erection of a reading-room at Flushing, Mylor. Plans and specifications can be inspected at the residence of R. J. Bird, Mount Pleasant, Flushing. Separate tenders to be sent to J. T. Holmes, the Manor Office, Plympton, by October 3.

Oct. 3. HELENS BAY (Co. Down).—Erection of a villa at Helens Bay, Co. Down. Plans, specification, and particulars may be obtained at the offices of the architect. Tenders must be delivered not later than October 3, to J. V. Brennan, C.E., architect, Belfast Bank Chambers, Belfast.

Oct. 3. DUNGLOE (Ireland).—Erection of a shop and house at Dungloe, Co. Donegal, for Anthony O'Donnell, Seskinarone, according to plans and specifications to be seen at the offices of J. P. M'Grath, architect, Commercial Buildings, Foyle Street, Londonderry. Tenders sealed and endorsed to be lodged with the architect by noon on Oct. 3.

Oct. 5. LLANELLY.—Erection of a new Calvinistic Methodist chapel, at Glenalla Road, Llanelly. Plans and specifications may be inspected at the office of Wm. Griffiths, F.S.I., architect. Sealed tenders to be delivered on or before Oct. 5, to T. Davies, 59, Marble Hall Road, Llanelly.

Oct. 5. LAMPETER.—Erection of premises at Lampeter, for the London and Provincial Bank. Ltd. Plans and specifications may be seen at the office of the architect. Tenders, sealed and endorsed, to be delivered not later than noon, on Oct. 5, to Ll. Bankes Price, architect, Doldrement, Lampeter.

Oct. 5. ST. IVES (Cornwall).—Erection of a caretaker's cottage, for the Corporation. Plans may be inspected at the office of the engineer, A. P. I. Cotterell, M.I.C.E., 28, Baldwin Street, Bristol, where specification, form of tender, and bill of quantities may also be obtained on deposit of 3 guineas. Tenders on the form provided must be delivered under seal, and endorsed, "Tender for St. Ives Waterworks," before 10 a.m. on October 5, to Edward Boase, town clerk, town clerk's office, St. Ives, Cornwall. (See also "Engineering.")

Oct. 5. WESTPORT (Co. Mayo).—Excavations, pipe laying, erecting pumping station, and concrete reservoir, etc., at the Westport waterworks, for the Urban Council. Copies of the specification and quantities may be had on application to C. Mulvany, M.I.C.E., Athlone, on deposit of £1. Sealed tenders, properly endorsed, must be lodged, not later than noon on Oct. 5, with Francis Egan, town clerk, urban council office, Westport (co. Mayo). (See also "Engineering" and "Iron and Steel.")

Oct. 5. SEVENOAKS.—Erection of a chapel at the new cemetery, Greatness Park, Sevenoaks, for the Urban District Council. Plans, sections, detail drawings, and specifications may be inspected, forms of tender and further information obtained at the offices of S. Towlson, A.M.I.C.E., surveyor to the Council, upon payment of a cash deposit of £5. Tenders must be on the forms supplied and sent enclosed in an envelope, endorsed "Tender for Cemetery Chapel," on or before Oct. 5, to Herbert J. Thompson, clerk to the council, Urban Council offices, Argyle road, Sevenoaks.

Oct. 5. NEWPORT.—Erection of a technical institute in Clarence Place, for the Education Authority, in accordance with drawings and specification, which may be seen at the office of the borough engineer, town-hall, where the bills of quantities, specification, and form of tender may also be obtained upon production of the borough treasurer's receipt for £5 5s., Sealed tenders, endorsed "Technical Institute," are to be sent not later than 5 p.m. on Oct. 5, to Albert A. Newman, town clerk and clerk to the local education authority, town hall, Newport. Fair wages clause.

Oct. 5. BOLTON-UPON-DEARNE.—Erection of chapel and boundary wall to cemetery, Bolton-upon-Dearne, for the Urban District Council. Drawings and specifications may be seen, and copies of quantities obtained, from the surveyor's office, between 10.0 a.m. and 3.0 p.m. daily (Saturdays excepted), upon a deposit of £1 1s. Tenders to be delivered not later than October 5, endorsed "Chapel" to J. Ledger Hawksworth, clerk, council offices, Station Road, Bolton-upon-Dearne.

Oct. 5. MIDDLETON.—Erection of an elementary school in Durnford Street, Middleton, to accommodate about 1,000 scholars, for the Corporation. Persons desirous of tendering are requested to send names and addresses not later than October 5, to Frederick Entwistle, town clerk, town hall, Middleton. Further particulars may be obtained from Edgar Wood, architect, 78, Cross Street, Manchester.

Oct. 5. BOURNEMOUTH.—Widening the Landing Stage at Bournemouth Pier (mainly of Greenheart timber), and other works in connection therewith for the town council. Drawings may be seen and full particulars and forms of tender and with F. W. Lacey, M.Inst.C.E., borough engineer office, provided a deposit of £5 has been lodged with F. W. Lacey, M.Inst.C.E., borough enginner and surveyor, municipal office, Bournemouth. A further deposit of a £20 Bank of England note is to accompany the tender. Tenders to be sent in envelopes provided to Geo. Wm. Bailey, town clerk, before 10 a.m. on October 5.

Oct. 5. LLANHILLETH (Mon.).—Erection of 20 houses at Llanhilleth, Mon., for the Hafodarthen Building Club. Plans and specifications may be seen at the office of D. J. Loughter, architect, Bank Chambers, Pontypool, to whom tenders, endorsed "Hafodarthen Club Cottages," are to be sent by October 5.

Oct. 5. YNYSYBWL (Wales).—Erection of a building for an electrical sub-station at Ynysbwl, for the Mountain Ash urban district council. Specification and form of tender and contract may be obtained and plans may be seen at the surveyor's office, town hall, Mountain Ash, and at the office of Mr. B. J. Day, 3, Park Place, Cardiff, upon deposit of one guinea. Sealed tenders upon the form supplied, endorsed "Electrical sub-station," must be addressed to the urban district council's offices, town hall, Mountain Ash, by Oct. 5. (See also "Engineering.")

Oct. 6. LLANELLY.—Additions, alterations, and improvements to Capel Newydd C.M. chapel, Llanelly. Plans and specifications, by Owen Morris, Roberts and Son, Mm.S.A., architects and surveyors, Portmadoc, can be inspected at the house of I. Davies, Ardwyn, Bryncaerau Villas, Llanelly, to whom tenders are to be sent (sealed and endorsed "Capel Newydd"), not later than Oct. 6.

Oct. 6. ELTHAM PARK, S.E.—Erection of a shelter and conveniences at Eltham Park, S.E., for the L.C.C. (No quantities have been prepared.) Persons desiring to tender may obtain drawings and specifications, form of tender, and other particulars at the architect's department, 19, Charing Cross Road, W.C., upon previous payment to the cashier of the council, at the county hall, Spring Gardens, S.W., of 10s. Tenders must be upon the official forms. Each tender is to be delivered at the county hall in a sealed cover addressed to G. L. Gomme, clerk of the London County Council, county hall, Spring Gardens, S.W., and marked "Tender for Eltham Park." No tender will be received after 11 a.m. on October 6. Fair wages clause.

Oct. 6. BURGHEAD.—Mason, carpenter, slater, plumber, plaster, painter, and glazier works of dwelling-house to be erected in Dunbar Street, Burghead. Plans, etc., may be seen with Charles C. Doig, architect, Elgin.

Oct. 6. SUNDERLAND.—Erection of a branch library in Church Street North, Sunderland, for the Corporation. Drawings, etc., may be seen, and form of tender obtained, at the office of Davidson and Cratney, architects, 22, Fawcet. Street, Sunderland, by whom bills of quantities will be supplied on payment to them of a deposit of £2 2s.

Oct. 6. WELLINGBOROUGH.—Alterations and additions to the buildings at "Bushfield" Waterworks pumping station, to provide for new filtering and softening plant. Plans, specifications, and particulars can be seen at the office of the surveyor, E. Y. Harrison, Park Road, Wellingborough. Tenders, sealed and marked outside "Buildings, Bushfield," must be delivered at the office of J. T. Parker, clerk, 29, Church Street, Wellingborough, by 5 p.m., on October 6.

Oct. 6. BRENTFORD.—Extensions to the Nurses' Home at the infirmary, for the Guardians, in accordance with plan and specification prepared by W. H. Ward, architect, Paradise Street, Birmingham, and which can be seen between the usual hours at the Union Offices. Surveyor's quantities will be supplied on receipt of one guinea. Tenders to be delivered before 4 p.m. on October 6, to William Stephens, clerk to the guardians, union offices, Isleworth, W.

Oct. 7. WALLS (Shetland).—Construction of a steamboat pier at Walls, Shetland. Plans and specification may be inspected at, and schedules of quantities obtained from Sievwright and MacGregor, solicitors, Lerwick; Scottish office, engineering dept., 122, George Street, Edinburgh; and from G. Woulfe Brenan, M.I.C.E., Albany Street, Oban,

Oct. 7. BURTON-UPON-TRENT.—Erection of a new Police Station, Superintendent's House and Court House, in the borough, for the Corporation. Drawings, specifications, and conditions of contract may be seen, and bill of quantities and form of tender obtained at the office of Henry Beck, architect, 10, High Street, Burton-upon-Trent, on and after Sept. 23, upon the deposit of a cheque or post-office order for £3 3s. Tenders, endorsed "New Police Station, etc.," must be delivered, not later than 10 a.m. on October 7, to T. N. Whitehead, town clerk, town hall, Burton-upon-Trent. Fair wages clause.

Oct. 7. BRIDGEND.—Erection of block of conveniences in Airing Court and additions, etc., to laundry at Angelton Asylum, Bridgend. Repairs to attendants' messroom, etc., at Parc Gwyllt Asylum for the committee of visitors of the Glamorgan county asylum. Specifications, bills of quantities, and forms of tender may be obtained from the clerk, and the drawings may be seen either at the office of the architect, R. S. Griffiths, Tonypandy, Rhondda Valley, or at Angelton asylum, Bridgend. Separate sealed tenders, marked outside "Tender for Laundry and Conveniences, Angelton," or "Repairs to Floors, Parc Gwylt," must be received not later than noon on October 7th, to W. E. Allen, clerk to the committee of visitors, Glamorgan county council offices, Westgate Street, Cardiff.

Oct. 7. SOUTH DUBLIN.—Erection of 206 labourers' cottages, under 46 contracts for the R.D.C. The works are to be completed under a penalty for delay. Plans, specifications and schedules may be inspected, and tender forms obtained at the offices of the rural district council; tenders are to be lodged not later than 11 a.m. on October 7, with T. J. Byrne, clerk of the council, 1, James Street, Dublin. Tenders must contain the names and addresses of two solvent persons willing to join the person tendering in a bond for the execution of the work of an amount equal to that of the tender.

Oct. 9. HEREFORD.—Extension of a classroom at Allensmore council school and other incidental works connected therewith, for the Herefordshire county council. Plans and specification may be seen and form of tender obtained at the office of the county surveyor, Shirehall, Hereford. Sealed tenders marked 'Allensmore" to be addressed to John Wiltshire, county education secretary, education office, Shirehall, Hereford, and delivered by noon on October 9.

Oct. 10. TROON (Cornwall).—Erection and completion of the proposed Wesleyan Methodist church at Plantation, near Troon, according to plans and specifications, which may be seen by appointment at the residence of Mr. Viant, near the present chapel, or at the office of Sampson Hill, architect, Green Lane, Redruth, from whom all particulars may be obtained. Sealed endorsed tenders to be sent to the Rev. W. M. Briggs, "Sidlands," Cambourne, by October 10th.

Oct. 10. COLCHESTER.—Extension of the Colchester Royal Grammar School for the governors, from plans and specifications prepared by Newman, Jacques, and Round, 2, Fen-court, London, E.C. Written applications for copy of bills of quantities, conditions, and form of tender must be made on or before October 10, to H. C. Wanklyn, town hall, Colchester, to be accompanied by a deposit of £5. A guarantee policy in £500 in some society, or company to be approved by the governors will be required for the performance of contract.

Oct. 10. GREAT BRIDGE.—Erection of goods Offices and extension of goods shed at Great Bridge, for the Great Western Railway. Plans and pecification may be seen and forms of tender and bills of quantities obtained at the office of the engineer at Wolverhampton station, between 10 a.m. and 4 p.m. Tenders marked outside "Tender for Works at Great Bridge," will be received until October 6, by G. K. Mills, secretary, Paddington Station, London.

Oct. 12. BISHOP AUCKLAND.—Erection of a secondary school at Bishop Auckland, for the Durham county council. Plans, specification and general conditions can be seen at the education architect's office, Shire Hall, Durham. Bills of quantities can be obtained on application to J. A. L. Robson, secretary for higher education, to whom sealed and endorsed tenders should be sent by October 12.

Oct. 13. EPSOM.—Erection of an iron and glass verandah at the Epsom workhouse infirmary for the guardians. Specification and drawings can be seen at the workhouse Epsom, between 10 a.m. and noon. Forms of tender can be obtained on application to the clerk. Tenders in sealed covers marked outside "Tender for Verandah" must be delivered not later than 7 p.m. on October 13, to Alick G. Ebbutt, clerk, "Gynsdale," Epsom.

FOR sale by tender, 3 ton travelling crane (Storthert and Pitt, makers), can be inspected in working order any time at Wombwell Wood Quarry. Tenders, endorsed "Crane," to be sent in before Oct. 7, addressed Alan Pye, Manager, Builders' Co., Barnsley. 4605

Miscellaneous.

BUILDERS' Books at tremendous reductions! Books on every subject and for all examinations, supplied; sent on approval. Catalogues free; state wants. Books purchased.—W. and G. Foyle, 135, Charing Cross Road. W.C.

SECOND-HAND Optical Mart.
for the Purchase and Sale of
LEVELS, THEODOLITES, DRAWING INSTRS.
—Clarkson's, 338, High Holborn, London, W.C. (Opposite Gray's Inn Road).

WANTED, to hire or purchase, by the York Corporation Distress Committee, about 800 yards of light tramway. Communications to be addressed to the Secretary, 16, Castlegate, York. 4595

MOTORS, two 7-ton steam waggons for disposal, working daily; owing to the completion of our new works at Wishaw we are now open to dispose of our waggons.—Barr, Ltd., Parkhead, Glasgow. 4597

Contracts Open.

HOLSWORTHY URBAN DISTRICT COUNCIL.
TO CONTRACTORS.

The above Council invite tenders for the Construction of an Impounding Reservoir, Service Reservoir, and Filter-Beds, and the Laying of Cast-iron Mains and other work at Holsworthy.

Plans may be seen at the office of the Engineer, Mr. J. Chadwick, Bletchley, Bucks, or at the office of the undersigned.

Copies of specification, quantities, and form of tender, may be obtained from the Engineer, on payment of £3 3s., which will be returned upon receipt of a bona fide tender.

Sealed tenders, endorsed "Holsworthy Waterworks," to be delivered to the undersigned on or before October 1st, 1908.

The Council do not bind themselves to accept the lowest or any tender.

W. C. R. Peterson, Solicitor, Clerk
Holsworthy, Devon.
August 24, 1908. 4588

Patent.

TO POTTERS, SANITARY ENGINEERS, AND OTHERS.

The Proprietors of British Patent No. 20322 of 1904, for "Sewer Traps or Valves," are desirous of entering into negotiations for the Sale of the Patent, or for the Grant of Licenses, to manufacture under Royalty.

Full particulars can be obtained from
GEORGE BARKER,
Chartered Patent Agent.
77, Colmore Row, Birmingham. 4589

October 7, 1908. Volume 28, No. 713.

Back to Back-to-back.

The defenders of back-to-back dwellings have, so to speak, put their backs up, and are fighting back-to-back. The committee of the Huddersfield Property Owners' and Ratepayers' Association have sent a letter to the local council protesting that the case against back-to-back dwellings has been greatly exaggerated. "Without entering lengthily into the questions of fresh air and sunlight," the secretary writes, "and their bearings upon the suggested substitution of small through houses for back-to-back houses, the committee more particularly wish to call your attention to the fact that the extravagant statements to which I have referred have not been supported by one tittle of reliable evidence, and are nothing more than theories and pious opinions, which, however strongly held, are not sufficient grounds for departing from a type of house which answers very well indeed, and which the committee can prove to be as healthy as any other form of dwelling of the same size." It is not clear whether the committee has adduced all its proofs in this letter, or whether it is keeping the strongest in reserve. All that is stated is that Halifax, "which has not allowed back-to-back houses for over fifteen years back," does not show a much more healthy death-rate than Leeds, which "has tens of thousands (not near so good as the Huddersfield type), and 486 in course of erection;" that though Nottingham "has had no back-to-back houses built for fifty years back" (how lovingly the secretary lingers on the seductive word "back!") it has the highest infantile mortality in the United Kingdom; that local insurance companies find absolutely no difference in death-rates between clients who have lived in through houses and those who have lived in back-to-back houses in Huddersfield; and that a census of the two kinds of houses is greatly in favour of the back-to-back dwellings. Considering that the census was taken by the Property Owners' Committee, this result is less impressive by its natural strength than by the fact that it rather discredits the evidence of the insurance companies. The case, however, is pre-eminently one in which comparative statistics can be made to prove anything. Mortality returns may possess a certain degree of significance when they have been carefully compiled and sifted, and classified and analysed, by disinterested experts; but even then they cannot be trusted as an absolutely accurate indication of the comparative healthiness of dwellings. The infant mortality, for instance, on which stress is laid, is probably due to parental ignorance, or other purely personal conditions, rather than to the absence of the notoriously salubrious back-to-back dwellings! And crudely presented mortality returns take no account of the lingering illnesses and chronic debility that must be rife where air-space and sunshine are insufficient. But it is quite unnecessary to labour the case. Be they never so salutary, back-to-back dwellings are abhorrent to healthy public sentiment, and their complete extinction is only a question of time.

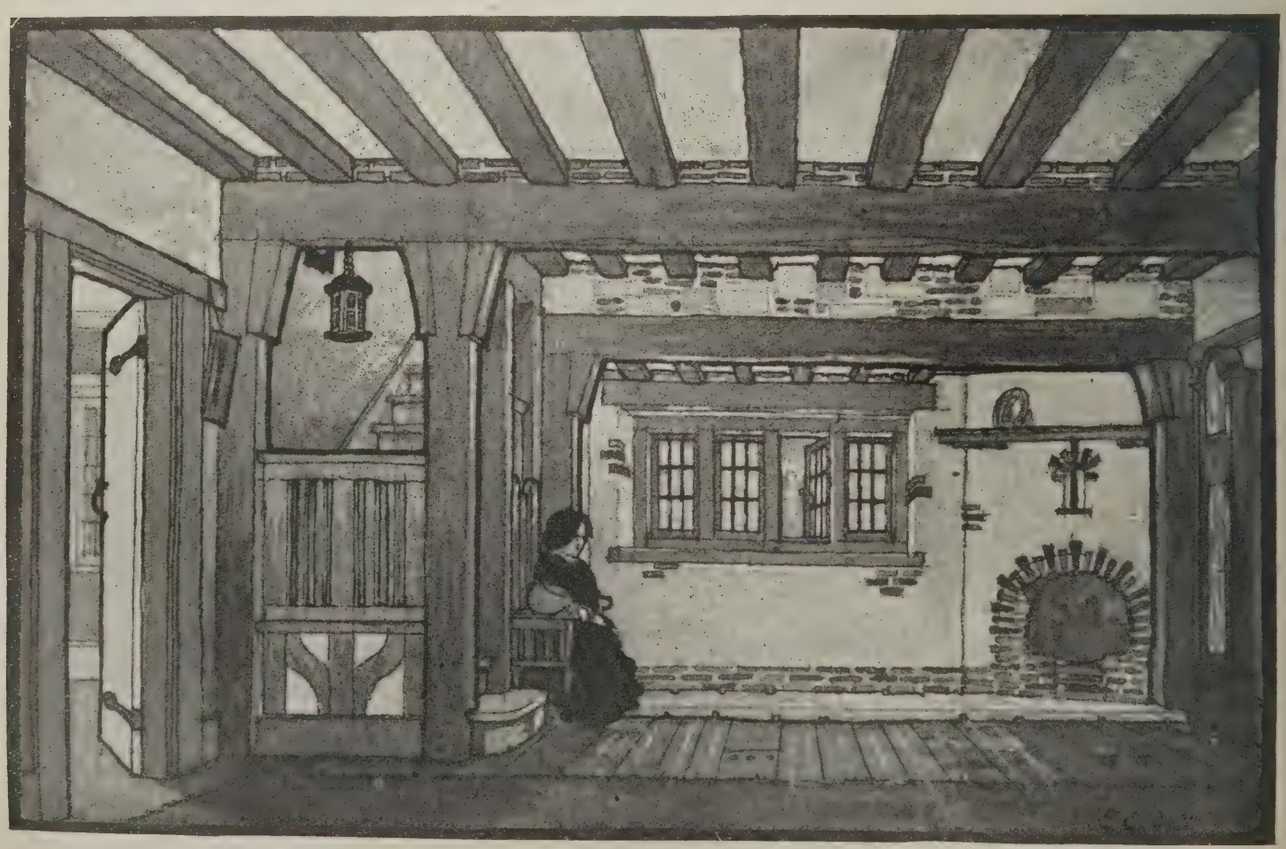
Fibrous Plaster to the Fore.

It seems that the enthusiasts who have acclaimed armoured concrete as the building material of the present and of the future have reckoned without fibrous plaster—and Mr. P. H. Boekbinder. That gentleman, it is stated, has just opened a fibrous-plaster factory at Chalk Farm, which, in the circumstances, seems to be a good place to date from, and in this respect atones nobly for the alleged inappropriateness of the place-name to a source of milk supply. It seems that the dazzling glories of the Milk-White City have seized the imagination of the polylot public, who have thus become violently enamoured of fibrous plaster, and will not be happy until they "have it in their houses." Mr. Boekbinder flatters their hopes. "There is no reason at all," he says, "why a man should not erect a building in this material for his habitation," and it seems almost a pity that, in the nature of things, the sanction can hardly hold good for the flip-flap, which, doubtless, many persons of ill-balanced views would like to reproduce in their back gardens. Mr. Boekbinder is reported to have told an interviewer "that if the Exhibition buildings are occasionally given a coat of boiled oil and then painted, there is no reason why they should not last one hundred years or more." On the other hand, and on a disinterested view of the situation, there seems to be no earthly reason why their natural term should be thus unduly protracted. A fibrous-plaster city is well enough for a festal season, but to perpetuate it as "something lingering, with boiled oil in it," would be positively inhumane. But we need not be greatly apprehensive of the universal reign of fibrous plaster as a structural material. We are reassured by the revelation of its abnormal and expensive appetite for boiled oil and paint.

Unfair Competitions: Manchester Moves.

The increasing need for keeping a sharp eye on competitions has been of late repeatedly shown, and alert vigilance has been constantly urged in the columns of this journal. Apparently the advice is bearing fruit. At its first sessional meeting, to-morrow, the Manchester Society of Architects will consider the following resolution: "That the council be asked to make the following by-law, and the same be adopted as a regulation of the Society: 'A member shall be considered to have failed in the observance of a lawful regulation of the society or of a lawful regulation, by-law, or order of the Council, within the meaning of article 61 of the Society's articles of association, and shall be liable to the penalties therein stated, if he shall submit either directly or indirectly a design in any architectural competition, the conditions of which are unsatisfactory to the Council, and of which notice has been given to the members by the secretary.'" We are not acquainted with the terms of the Society's articles of association (nor, indeed, with the circumstances that have led the Manchester Society to take this step), but presume that the penalties to which reference is made are sufficiently drastic and deterrent. The pity of it is that they cannot be made to apply—except perhaps indirectly—to the persons responsible for imposing the unfair conditions that tempt the invertebrate and weak-kneed architect to disregard his own dignity, and to forget the loyalty he owes to his profession and to his society. The very mean but very natural disposition to take advantage of a period of depression by sweating the architect can only be counteracted by such steps as the Manchester Society seems able and willing to take, and by such publicity as we are always happy to afford as occasion demands.

London Street Architecture.



The Piccadilly Hotel—of which, by the way, an illustrated description will appear in the forthcoming issue of the "Architectural Review"—is, Mr. Leonard Stokes assured an interviewer the other day, "the admiration of all architects." He referred, of course, to the external design by Mr. Norman Shaw; for the object in seeking Mr. Stokes was to ask his opinion as to whether, in his opinion, London was improving architecturally, and was evolving a style of its own. Mr. Stokes's answers to the questions with which he

was plied were characteristically diplomatic. He could not admit that we have achieved much in street architecture. He nevertheless conceded that the city is undoubtedly being filled with fine buildings, in which beauty, as well as business utility, has been considered—for instance, the Electra building, the Institute of Chartered Accountants, the police headquarters at New Scotland Yard, and several new fire stations. The new War Office, and the new block of Government buildings in Parliament Street, he remarked, have undoubtedly suffered from the deaths of their architects before the buildings were completed, as the constant adaptations and improvements that suggest themselves as the work is in progress are necessarily missing. But our street architecture suffers from lack of corporate agreement or control. "In Paris," Mr. Stokes is reported as having said, "they have no difficulty in building streets in which the houses have cornices of the same height, and are of similar style and treatment; but when the Englishman has designed and built one house, he seems exhausted, and the next must be different. Then one man has a notion for making his building very lofty, and the next has a scheme for making his very wide; the one builds his of stone, and the other has a strange fancy for crockery, and they set them next door to one another. What are you to do?" We can at least console ourselves with the belief that this variation of style and material is a manifestation of the sturdy independence of the national character, and with Mr. Stokes's apparently rather reluctant conclusion that "as one looks round he must admit that people are beginning to care for beauty."

THE ARCHITECTURAL PROFESSION OF TO-DAY.—IV.

To-day the exigencies of fashion, or taste, demand that designs for public buildings should be more or less in keeping with the architectural school and traditions of such masters of the later Renaissance as Wren, Gibbs, and Chambers. But, as might be expected, recent successive experiments in other fields of architecture have not been conducive to the acquisition of a thorough knowledge and understanding of the now fashionable style of art, and consequently the production of good work of this type of design now in vogue is the exception rather than the rule.

It will not need much reflection on the part of our readers to make it evident to them that whilst some acquaintance with almost every phase of design is necessary for the proper training and development of the artistic instinct, yet, inasmuch as the art of architecture is long and life is short, only an exceptionally highly gifted man can reasonably expect to be a successful practical exponent of more than one style. Yet most of the older architects of our day, as we have shown, have devoted successive peroids of their lives to the practice of Gothic, "Free Classic," Jacobean, and Palladian work. The production of good architecture, in any one style, demands something more than this most uncertain method of acquiring the requisite facility, and the present day system, therefore, appears to us to be scarcely more than sufficient to meet the needs of the *dilettante*. It was the *absence* of any such arbitrary change of style that enabled the mediæval craftsmen (who were trained in accordance with an organised course of communal artistic study based upon tradition in alliance with certain very definite and invariable artistic aims and aspirations) to produce the magnificent buildings of their day, in which, however, individuality was lost and the art of the period was the joint product of many minds educated in the same school of thought. On the other hand, individuality was very pronounced among the architects of the Italian Renaissance school, the great masters of which were, perhaps almost without exception, the best scholars and most highly cultured men of their day, by whom the artistic triumphs of ancient Greece and Rome were thoroughly appreciated and closely studied and understood. But now we have neither educational communities bound by definite aspirations nor even any considerable number of cultured men working independently of each other. Consequently, our architecture is largely expressive of the *personal* taste of the practitioner, whose work, consequent upon the imperfect nature of his education, is only too often deplorably bad. We do not overlook the undoubted fact that the architectural profession contains within its ranks some highly gifted and enthusiastic workers, but, as we have said, owing in a great measure to the general want of thoroughness and definiteness in their early studies in art, they are unable to do full justice to their undoubted abilities. With the constantly increasing number of architectural failures apparent on the completion of successive public buildings is it not reasonable to

HOUSE AT HAMPTON HILL, MIDDLESEX: THE HALL. CASTLE & WARREN, ARCHITECTS. (SEE CENTRE PLATE.)

abandon the utterly fallacious and indeed mischievous idea that the architect is born and not made? Compare the practical wisdom of Sir Joshua Reynolds with the vapid utterances of the "art for art's sake" mountebank. "The artist who has his mind filled with ideas and his hand made expert by practice works with ease and readiness, whilst he who would have you believe that he is waiting for the inspiration of genius is in reality at a loss how to begin, and is at last delivered of his monsters with difficulty and pain."

Or, again, hear what the late Sir Wyke Bayliss, President of the Royal Institute of British Artists, had to say on the subject of art education: "As to the schools of the Royal Academy I would not have a student admitted to them who could not pass an examination in Homer, Virgil and Dante. Nor would I admit any one of them to honours who could not read at least one of these great poets in his own language, or who had not taken a University degree." To the obvious objection that was raised as to the students' loss of time, Sir Wyke replied that it would be no waste of time but a "time of growth," and he added the following words with which we must all agree, "The work of the artist is the expression of the mind of the artist. If his mind is ugly, his works will be ugly, and we do not desire to look into an ugly mind."

To us it seems that the whole architectural profession has long been engaged in the profitless occupation of "marking time," lest by the adoption of a progressive policy and the institution of a system of education devised upon practical lines, it should, unhappily, prematurely cut short the career of the remarkable artistic genius "unfettered by scholarship or tradition," whose advent has been so confidently predicted. But, in addition to awaiting, in a state of suppressed excitement and expectancy, for the coming of this abnormal individual, what is the profession doing for the students of to-day—the architects of to-morrow? Probably, there was never an age in which architects, so persistently and at such length, proclaimed their devotion to the art of architecture, or studied it in a more haphazard and superficial manner. For there *must be* something radically wrong in a system of education which only enables the average man to discriminate—if indeed at all—*towards the end of his career*, between what is good and lasting and what is bad and ephemeral in his art. Fortunately, we do not now hear much in this country of *L'Art Nouveau*, but a few years ago its influence was quite apparent, and those architects whose scholarship was insufficient to enable them to withstand its pernicious influence must, undoubtedly, have wasted time which might otherwise have been profitably employed in the study of the many good examples of art which have received the approval of successive generations of artists. Nothing but education of a very definite nature will enable architects to avoid similar future hindrances (which may well be of constant occurrence) to the advancement of their art. Why, for example, when the best work of the Italian Renaissance affords an object lesson in how to apply the elements of classic art in a *grammatical* and *appropriate* manner to modern requirements, do architects insist in culling from the worst period of that style, and thus produce designs in which the proportions and refined details of the inimitable art productions of ancient Greece and Rome are wantonly burlesqued and vulgarised? Surely this is due solely to that lack of discrimination and taste, which is proof positive of the inefficiency of their artistic education. Probably these men would not approve of the methods of a fourth or fifth rate *litterateur* who held Shakespeare up to ridicule by consistently burlesquing his immortal works. Yet in what respect does their own conduct differ? We have no desire to critically discuss at any length the curricula of study adopted at the existing schools of architecture throughout the country, but from the fact that they have *not* been arranged or organised in accordance with any ascertained general consensus of opinion among architects, we frankly confess we regard them with a certain amount of suspicion. Indeed, it is doubtful whether the establishment of any number of schools or teaching establishments controlled and administered by men many of whom regard architectural scholarship as of comparatively small importance, who have no fixed or very definite ideas as to what constitutes good architecture, and who do not understand or appreciate the correct principles of planning its geometrical foundation, or the essentially organic nature of correct design,—is likely to prove very beneficial to the welfare of the younger generation of architects.

In our view, steps should be taken for the institution of a national College of Architecture, subsidised and encouraged by the State, in which students could acquire a course of architectural training alike akin in the definiteness of its aims and the severity of its mental discipline to the curriculum so long successfully adopted at the Ecole des Beaux Arts, where young men are taught the *art* of architecture, not the art of qualifying, in the shortest possible time, for earning a living by the conduct of an architect's "business."

We have dwelt at some length upon the question of the architect's education, as we regard the present system, or want of system, as being the chief of the many hindrances to the advancement of his art, and consequently to his own welfare, which surround the architect of to-day. But, whilst we have endeavoured to show that an improvement in the education of architects will undoubtedly effect a corresponding improvement in the architecture of the time, because when once the correct principles of planning and design are understood by assessors, competitions will soon cease to be, as at present, mere lotteries, if not indeed occasionally something worse, yet there are other evils (according to common report, prevalent in the architectural profession) which it would be impolitic, and indeed almost cowardly, to ignore.

The course of public lectures on "Renaissance (including modern) Architecture," begun on Monday last at the University of London, Imperial Institute Road, South Kensington, S.W., by Mr. Banister Fletcher, F.R.I.B.A., will deal with the principal buildings erected in Europe from the fifteenth century to the present day. At the same place, on Tuesdays, at 3 p.m. and 8 p.m., Mr. Percival Gaskell, R.B.A., is delivering a course of twenty-four lectures on "English and French Painters." In each case the lectures are illustrated by lantern slides and otherwise.

Correspondence.

The Architectural Profession of To-day.

To the Editor of THE BUILDERS' JOURNAL

SIR,—I anticipate that your articles on the above subject will be of great interest to all thinking architects. Your correspondent, "A Struggler," suggests that the country requires a period of "increasing prosperity" before it can give adequate employment to architects and builders. Could not this "increase" be obtained by tariff reform, which would encourage the investment of capital in home industries and the building of factories and workshops, accompanied by housing accommodation for masters and men? I hope that my raising a "political cry" will not prevent the insertion of this letter.

F. J. FORSTER, A.R.I.B.A.

Wimbledon.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I am glad to see in your last two issues that you have taken up seriously the state of the profession with a view to studying the cause of want of employment, etc., and I am only sorry that your articles—perhaps discreetly edited—cannot appear in a journal which is widely read by the general public. I take it in the nature of things your leaders are written from information gathered in London more especially, and I know from many friends in London that bad times are being experienced there in our profession, as in all other trades; but I think if you could make inquiries in the provinces you would find more food for reflection on the internal workings of our calling than is to be found in the metropolis. Naturally, general depression in all business must affect architects, but the curse of the profession, as a profession, is the indiscriminate taking of pupils, which leads to the production of bad work, besides the overcrowding of our ranks. I believe I am within the mark when I say that I do not believe, amongst the twenty or more architects in a town I could name, you will find a dozen paid assistants. I know of one man in particular who for some years had quite a respectable—in size—practice, who always had two or three men in his office, and who himself told me he had never had a paid assistant. In this way much mischief is done; bad work results, with its consequent reflection on the profession; and all these half-baked architects or ex-pupils are swelling the ranks of the unemployed, which, again, naturally leads to cutting prices. A drowning man catches at a straw, and a starving architect will take 4 per cent. rather than nothing, and who shall blame him? You lay great stress, and rightly, on the *well-qualified* architect. If none but such got the work there would be more than enough to go round; but whilst we are governed by such a self-satisfied body as the R.I.B.A., with its dog-in-the-manger attitude towards registration, how is such a consummation to be attained?

DEVON.

[The articles in question are written by a well-known architect, who is acquainted with brother architects in many provincial centres, and who is kept informed by them of the course of events in their respective districts. We do not know that he is particularly well informed of matters in our correspondent's county, and we are pleased, therefore, to give publicity to his experiences on this question.—ED. "B.J."]

Proposed New Works.

Barnes, Surrey. — The U.D. Council have passed plans for the following:—New infants' school, Lower Richmond Road, Messrs. Jarvis and Richards; five houses, Glendower Road, Mortlake, Messrs. C. Ellis and Co.; a lean-to, 16, Glentham Road, Messrs. Walker and Sons; addition at rear of 18, Sheen Lane, Mr. Bertram Richardson; and extension of coach-house, "Hiawatha," Castelnau, Messrs. Harrods, Ltd.

Birmingham: Aston. — The Aston Board of Guardians have had designs prepared for a new central laundry at the Workhouse.

Cambridge.—The Town Council have passed plans for the following:—Office and cart shed, Tenison Road, G. Bolton, 106, Regent Street; laundry, 86, Castle Street, Mrs. Brown, Alpha Road; three houses, St. Barnabas Road, E. Willmott, 12, Hope Street (subject to an agreement for combined drainage being executed); house and laundry, Madingley Rise, H. F. Newall, Madingley Rise; laundry, etc., Coldham's Lane, the Coldham Laundry Company, Cambridge.

Ealing.—Plans have been submitted to the Borough Council for a large roller skating rink, to be known as Walpole Hall. The building, to be of steel and brick, will be 158ft. long and 70ft. wide. The hall will also be available for Badminton, winter lawn tennis, and bowls, and for dancing. Mr. Alfred Burr, F.R.I.B.A., is the architect.

Hedon, Yorkshire.—The parish church is to be restored under the supervision of Mr. John Bilson, F.S.A., of Hull. Funds are now being collected for the purpose.

Knaresborough.—The U.D. Council contemplate erecting new offices, and are negotiating for a site.

London, S.W.—No. 38, Queen Anne's Gate, and the adjoining house, are to be demolished, and a new office block is to be erected on the site.

London: Chelsea, S.W.—Plans for artisans' dwellings to be erected at Manor Street, on a site given the Borough Council by Earl Cadogan, are to be submitted his lordship's approval. A scheme which provides for a five-storey building, with forty one-room tenements and eighty two-room tenements, at an estimated cost of £17,300, has been approved by the Public Health Committee.

London: Lewisham.—The Borough Council have passed plans for the following: J. W. Heath and Sons, Phœbeth Street, six houses; H. and G. Taylor, Caterham Road, eight houses on north side; W. J. Scudamore and Son, Chalcroft Road, five houses on north side; Willson and Deverall, Sangley Road, seven houses and shops on the north side; James Watt, Bromley Road, Southend, six double houses; Norfolk and Prior, Glenwood Road, four houses on the west side; S. J. Gerrard and Son, Algernon Road, 17 houses on the west side; W. Wilkinson, Limes Grove, four houses and a shed, north side; W. Brenton, Crofton Park and Ewhurst Roads, five houses on the north-west side and stables; J. Nicolls, Ewhurst Road, three houses and one shed; E. C. Christmas, London Road, a house in the rear of No. 94; Frazzi Fireproof Construction, Ltd., Prince's Road, a motor-house on the west side; B. G. Bateman, Trewsbury Road, motor-house at No. 30; G. Parker, Champion Park, an addition to school premises.

Manchester.—Proposals are being considered by the Corporation for alterations and extensions of the Royal Exchange, which has been suggested by the directors of that institution.

Middlesbrough.—The Free Library Committee are contemplating the erection of another library, and are looking for a site.

Natland Cumberland.—The present church, which is not interesting architecturally, is to be demolished, and a new building erected at a cost of £4,500.

Newcastle-on-Tyne.—A scheme is on foot to build a large hall, off Northumberland Street, suitable for concerts and public meetings. Mr. G. G. Laidler, of Northumberland Street, is mentioned as the originator of the scheme. The hall is to accommodate 5,000 people.

Sheffield.—The old chapel at Attercliffe is to be restored at a cost estimated by Mr. J. D. Webster, the diocesan architect, at £350 to £400. The Lord Mayor and other prominent citizens are interesting themselves in the movement.

Solihull.—The District Council are proposing to build, with the Yardley U.D. Council, a joint isolation hospital, at a total cost of £11,650, of which Solihull is to pay £6,500.

Stourbridge. — The Worcestershire County Council are about to erect a new elementary school for 250 pupils.

Buildings in Progress and Completed.

Exeter.—The ancient church of St. Laurence is being repaired and renovated under the direction of Mr. Harbottle Reed, architect, Exeter.

Haileybury College.—A new racquet court has been erected at a cost of £2,200.

Killinghall.—A new organ, the gift of Mrs. Cautley, a parishioner, has been installed at the Parish Church at a total cost of £680. It has been built by Mr. Wm. Andrews, of Bradford.

Kingston-on-Hull. — A new Sunday School for the Wycliffe Congregational Church is being erected at a cost of £2,000, defrayed by Mr. James Archibald.

Oxford.—St. Paul's Church has been re-opened after extensive alterations. In the chancel wood panelling has been substituted for the cumbersome stone casing round the walls of the sanctuary. Additional space has been obtained by the removal of the two steps inside the altar-rail, the floor of the sanctuary being now level throughout, with the exception of the dais for the altar. In the treatment of the walls, the lower cornice has been entirely removed, and the upper cornice replaced by one of bolder design, which has been extended to the eastern walls of the nave. It is supported by two pairs of pilasters on each side of the chancel and single pilasters outside, the general effect being to give greater height and dignity to this part of the church. New desks of fumed oak have been provided for the choir boys. The nave has been levelled and the seating entirely re-arranged, the chief feature being the provision of a central aisle, 5ft. 4in. in width, paved with black and white tiles, in addition to side aisles paved in a similar manner. The unsightly wooden porch inside the west door has been removed, as have also all the seats beneath the gallery, this space being left clear. The font has been moved to the north-west corner, and at the opposite corner a new door has been inserted, this being approached by an inclined path leading from the street pavement. The work has been carried out by Messrs. W. H. Wheeler and Son, the architect being Mr. F. C. Eden, of London.

Sculcoates.—A handsomely appointed new parochial hall for the parish of St. Mary's has been recently opened in Sculcoates Lane. The new premises have been erected at a cost of over £1,100. The main hall will accommodate about 300 persons, and in addition there are three commodious class-rooms, whilst communication is established with the adjoining iron mission church without its being necessary to leave enclosed premises. Mr. Dossor is the architect, the builder being Mr. F. Bilton, and the contractors for the woodwork, fittings, etc., Messrs. J. Taylor and Son.

St. Albans.—The Bishop of St. Albans opened a new girls' high school on September 21st. The buildings provide for 200 scholars, and have cost more than £7,000.

Seaham.—A new lifeboat house and slipway has been erected at the Harbour from the designs of Mr. W. T. Douglas, engineer to the National Lifeboat Institution. The cost was £3,000.

Sketty.—A new north aisle, designed by Mr. Glendinning Moxham, F.R.I.B.A., of Swansea, has been added to the parish church. Mr. Glynn Vivian has defrayed the cost.

Swannington.—A new Wesleyan Chapel is in course of erection from the design of Messrs. Withers and Meredith, architects, of London, at a cost of £1,619. The contractor is Mr. A. B. Moss, of Coalville. Externally the building will be faced with red sand-stock bricks from Measham, with stone dressings, and the roof will be covered with hand-made red tiles. The window-frames will be wood. Internally the building will be panelled all round to dado height, and the pews and pulpit will be of pitchpine. The schoolroom will be separated by a partition, which may be removed on special occasions, throwing the whole into one room capable of seating 400 people.

Thornton-le-Dale.—A new Wesleyan Church, to seat 300, and to cost £2,400, is being erected here.

Turriff.—The new Higher Grade and Junior Student School has been opened. The building, which is faced with local red freestone, comprises class-rooms, gymnasium, art and manual instruction, carpenters' shop laundry and cookery rooms, house-wifery rooms, etc. Mr. W. L. Duncan, Turriff, was the architect; and the following were the contractors:—Mason, Mr. James Robb; carpenter, Mr. W. H. Skene; slater, Mr. James Gillespie; plasterer, Mr. James Clark; plumber, Messrs. Charles Duthie and Sons; and painter, Mr. James D. Watson all of Turriff. The fittings were executed by Messrs. D. Macandrew and Co., Aberdeen; and the gymnastic fittings by Messrs. Spencer, Heath, and George, Ltd., London. The total cost, including fittings and architect's fees, will amount to between £3,600 and £3,700.

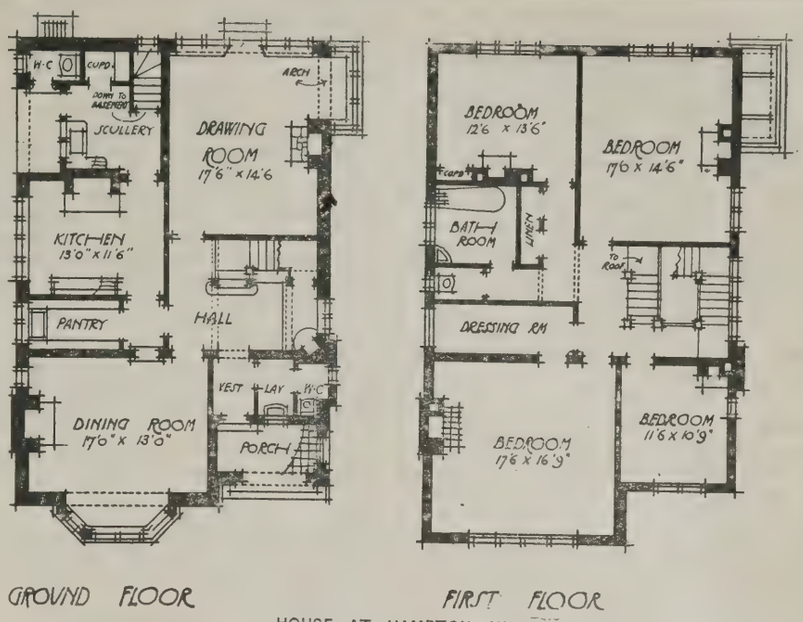
Wirksworth.—The opening of the new Grammar School, which has cost £4,500, took place on September 9th. The new school is on the land facing the Hannedges, and occupies a prominent position. It has accommodation for 90 students, and girls as well as boys are now included in the curriculum. The architect was Mr. Widdowes, of Derby, and the contractors were Messrs. G. W. Walker, of Wirksworth.

LIBRARY
OF THE

HOUSE AT HAMPTON HILL, MIDDLESEX.

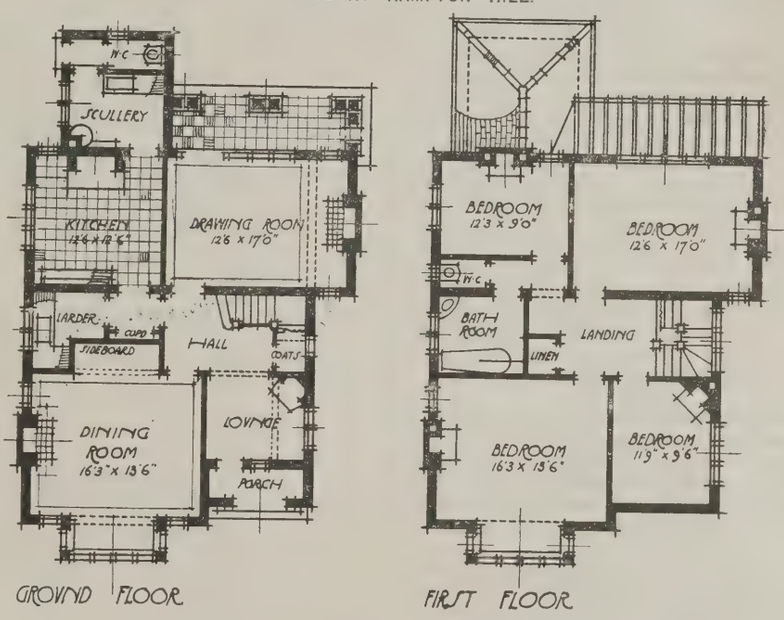
CASTLE

EN, ARCHITECTS



HOUSE AT EAST. MOLESEY, SURREY.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS



Our Plates.

The two houses we illustrate have recently been completed from the designs of Messrs. Castle and Warren, of London. The house in Park Road, Hampton Hill, has the exterior treated with oak timber-work left its natural colour, with all junction pins left projecting. The walls, where the timber-work does not occur, are faced with soft red mottled bricks, and the roofs are covered with sand-faced red roofing tiles, and the ridges formed with half-round tiles in cement with wide joints. The interiors are treated with some regard to the feeling suggested externally, and the hall is treated with oak beams and joists revealed and ceiled in between. The dining room is panelled out in oak. There are two bedrooms in the roof, extra to those shown on the plans. Mr. J. Curtis, of Gloucester Road, Teddington, was the builder.

The walls of the house in St. Mary's Road, Molesey, are externally covered with white rough-cast, with soft red mottled bricks at base, and the roofs are covered with red weathering tiles. The window frames are painted white, and the porch posts and beam are in oak. Internally, the rooms are treated quietly, with due regard to economy, a feature being made of a verandah overlooking the garden from the drawing-room. The builder was Mr W. H. Ladbrook, of Kew.

HOUSE AT HAMPTON HILL.

Notes and News.

The rebuilding of Buckingham Palace, is suggested by Mr. William Woodard, F.R.I.B.A., should be in accordance with a somewhat severe type of Renaissance. The whole of the exterior, he thinks, should be of Portland stone, and a minimum amount of carving should be employed, as he thinks florid carving is entirely unsuited to the London atmosphere, whereas Portland stone is well known to be the only material which will last in the metropolis. We have good examples of it in St. Paul's Cathedral, the Horse Guards, and the Admiralty. If Buckingham Palace had been built of Portland stone, perhaps the effect might have been better, even the result of age, but inasmuch as, for cheapness sake, it was built of Bath stone—a material well known to decay rapidly in the London atmosphere—it has been painted over as a preservative preparation, and this has added to the mean appearance of the structure.

* * *

The inelegant name of a mighty trafficker in London house-property is rescued from oblivion by a writer in a recent issue of the "Daily Chronicle," who avers that every day in London thousands of persons are inhabiting, trafficking in, or passing through, the structures and streets erected by Dr. Barnardo. He began life as a doctor, having graduated M.D. at Utrecht, and become an honorary fellow of the College of Surgeons. But "that trade failing," as Roger North says of him, "he fell into that of building, and the Fire of London gave him means of doing and knowing much of that kind." He built Essex Street, in the Strand, and its purlieus, pulling down the great house of the Earl of that name to do it; he built the courts of the Inner Temple after the fire in 1681; he built the Six Clerks' Offices in Chancery Lane; he laid out and built a good part of the houses and streets about Red Lion Square, in Holborn, with the Bedford and Rugby Trust streets which adjoin them, and provide the chief revenues of the Bedford and Rugby schools. He built himself a house at the end of Crane Court, later the home of the Royal Society, and only in recent years replaced by modern offices. He also bought Sir William Gresham's old house at Osterley Park, Middlesex.

* * *

News of the abandonment of the scheme for restoring Hales Owen Abbey "will have been received regretfully," says a Midland contemporary, "by local antiquarians familiar with the remains of the only monastery of the Premonstratensian order in Worcestershire." Antiquarians who are not local will share the regret: they lose so fine an opportunity of accusing the restorers of vandalism! But there are substantial reasons for regretting that no immediate steps are to be taken for the preservation of so interesting a relic. Apparently the building was begun in 1218. At the time of the dissolution, much of the stonework was broken up for use in mending the roads, and to-day the abbey is a mere wreck.

* * *

Mr. F. E. P. Edwards, the retiring city architect for Bradford, entertained the staff of his department to a farewell supper at the Union Club, Bradford, last Friday. Hearty congratulations were offered to Mr. Edwards on his appointment as city architect of Sheffield, and the staff presented him with a small desk clock.

* * *

An addition to the fire station is being made at Windsor Castle. The fire-resisting floors that have been adopted are on the "Fawcett" system.

* * *

For the extensive stores, stables, and offices for Messrs. Greenall, Whitley and Co., Ltd., Foregate Street, Chester, which are now nearing completion, the constructional steelwork, fire-resisting floors, and finishes throughout have been supplied by Messrs. Homan and Rodgers, Manchester. Messrs. J. H. Davies and Sons, Chester, are the architects.

The Architectural Association of Ireland has issued a provisional programme of meetings for the forthcoming session, which begins on October 13th, when the annual meeting will be held, and the president, Mr. Edwin Bradbury, M.R.I.A.I., will deliver the inaugural address. The arrangements include the following papers and discussions: November 24th, Dr. MacDowell Cosgrave on "Georgian Work in Dublin"; December 8th, Mr. H. Crawforth Smith on "Gardens"; December 22nd, discussion "Which past style of architecture is most suitable for modern domestic work?" On January 12th, 1909, Sir Aston Webb, F.R.I.B.A., will deliver "A Talk to Students."

* * *

With reference to the description of Portsmouth Technical College, on 212 of our issue of September 16, we are asked to mention that the whole of the constructional iron and steelwork in fireproof floors, roofs, girderwork, stanchions, staircases, and metal ceiling for plasterwork, costing in all about £6,000, was designed and carried out by Messrs. Peirson and Co., 17 and 18, St. Dunstan's Hill, Great Tower Street, E.C.

* * *

"Romanos," in the Strand, London, is now undergoing new and very effective decorative treatment. The ornamentation on the walls of the large central hall is being relieved with a back-ground of "Coatostone" in light colour, a preparation which gives the effect of a natural stone. The patentee of this material is Mr. A. W. Neal, of the Coatostone Decoration Co., 77, Mortimer Street, Regent Street, W. The Coatostone Decoration Co. have now opened a branch office at Milton Chambers, Weston Road, Southend-on-Sea, where they are carrying out a large amount of work both to interiors and exteriors.

* * *

We understand that a large order for plastering and reinforced concrete work, on an extensive and important London contract that is being speedily completed, has been secured by a well-known Liverpool firm of plasterers.

* * *

The Westminster City Council proposes to take the opinion of the rated occupiers of the buildings which extend from the statue of Charles I. at Charing Cross to Parliament Square, on the desirability of the entire street being known as "Whitehall." The Local Government Board has asked the council not to affix a "Parliament Street" nameplate to its new building, as it wishes its address to be "Whitehall."

* * *

Cornish Granite for the Government Works at Portsmouth.—How the Government had been persuaded to accept the tender of Cornish merchants for the supply of granite for the new works at Portsmouth was told by Mr. Hay Morgan, M.P. for the Truro-Helston division, at a meeting of his constituents on September 24th. In the spring of the present year, he said, a conference was called of representatives of the granite industry from all parts of the kingdom, who discussed the granite industry in all its bearings. In the result, it was decided to ask Mr. McKenna and Dr. Macnamara to receive a deputation. Mr. McKenna complied with the request, and, as a result of the representations made by the deputation, the Government had decided to pay a higher price for the Cornish product, rather than import Norwegian stone for the works at Portsmouth.

* * *

Dumbarton Castle, which is about to be transferred from the custody of the War Office to that of H.M. Office of Works, will, it is anticipated, be carefully restored in the historic portions, while the anachronisms in point of architectural style (their existence will be understood when it is recalled that the castle has been used as a sort of barracks) will no doubt be cleared away.

* * *

Nantwich by-laws are undergoing revision. At present there are two sets in force, and the want of uniformity gives rise to many anomalies and much inconvenience; both sets, for instance, may be in force in the same street, while several parishes do not come under the by-laws at all.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Oct. 31	BURY. NEW SECONDARY SCHOOL for the Education Committee. Premiums of £50, £25, and £10. Particulars and site plan from Robert Wilkinson, Director of Education, 8, Bank Street, Bury. Deposit £1 1s.
Oct. 31	*ROMFORD. COUNTY HIGH SCHOOL FOR GIRLS. Applications for Conditions to D. T. Williams, 71, South Street, Romford, Essex, to be made by or before August 24th, accompanied by deposit of five guineas, of which sum five pounds will be returned on receipt of bona fide design.
Nov. 1	CARDIFF. COUNTY HALL AND OFFICES. Particulars and site plan from T. Mansel Franklen, Clerk, Glamorgan County Council Offices, Cardiff.
Nov. 14	WHITEHAVEN. NEW PUBLIC ELEMENTARY SCHOOL, Irish Street, for 700 children. Limited to Cumberland architects. Plan of site and conditions from W. D. P. Field, Secretary, Education Committee, Town Hall, Whitehaven. No statement as to premiums or deposit.
Dec. 14	BLACKPOOL. CENTRAL PUBLIC LIBRARY.—Premiums of £52 10s., £31 10s. and £21. Particulars and site plan from T. Loftos. Town Clerk, Town Hall, Blackpool. Deposit £1 1s.
No Date.	CORNWALL COUNTY OFFICES.—Designs and *Estimates* invited. Premiums of £50 £20 and £10. Premium for successful design to merge in Commission. Particulars from C. L. Cowlard, Clerk to County Council. Bodmin. Deposit, £1 1s.

* *This competition has been unfavourably reported upon by a Correspondent.*

Ilford Emergency Hospital.—The competitive designs for the above will be exhibited in the Reading Room, High Road, Ilford, on Thursday, October 8th, from 10 a.m. to 7 p.m., and on Friday, October 9th, from 10 a.m. to 10 p.m.

* * *

War Office Buildings, Vienna.—Sixty-six competitive designs were submitted for the above. The first place is given to Mr. L. Baumann, of Vienna; the second to Messrs. L. Sommerlatte and J. Marschall, of Vienna; and the third to Messrs. M. Komor and Deczo Jakab, of Budapest.

* * *

New Secondary School for Cleckheaton.—The assessor, Mr. Vickers Edwards, of Wakefield, has delivered his report upon the designs submitted by competing architects for the above. Prizes of £50, £30, and £20, respectively, were offered, and the awards were made as follows:—Mr. William H. Thorp, F.R.I.B.A., Leeds; 2, Mr. W. S. Braithwaite, Leeds; 3, Mr. R. Fielding Farrar, A.R.I.B.A., Leeds.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible.
The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.
The querist's name and address must always be given, not necessarily for publication.

Cement Roughcast.

SHEFFIELD.—ENQUIRER writes: "In your issue of August 19th, you give an article on rough-casting, which deals with lime rough-cast only. Would not Portland cement make a much more durable and weather-proof job? Is there any drawback to the use of Portland cement in this connection, besides the greater cost involved? Please state the usual proportions for mixing when Portland cement is used, and if the hints given for lime rough-cast require any modification for Portland cement.

Portland cement would undoubtedly make a much more durable and weather-proof job than ordinary lime rough cast, but as a rule, if a person is able to get a passable job done, more especially if assured of good workmanship, he is more inclined to accept this than a more expensive method, and to put the extra cost into something that can be seen, either in external or internal decoration. This is more especially the case in villas. A good proportion for use with Portland cement and washed sand is one to two, and the finishing coat should be of clean, sharp shingle, and washed sand in similar proportion. Sometimes, however, if desirable, the first coat may contain a slightly larger proportion of of sand. It must be borne in mind that Portland cement has slightly different properties to lime, due to its fast drying nature, more especially if very new. As a matter of fact, if used in this state, the probability will be that expansion will naturally take place when wet, with the result that in setting it will contract and burst.

RALPH STONE.

Repair of Faulty Drains.

STAPLEHURST.—F.B. writes: "I am working for a gentleman who has been advised by an architect (as a friend) to have the drains of his house opened and tested, and if they are found to be faulty or leaky, to repair them by means of cement and compressed air. I have not heard of this method before. Will you explain the working, and also the probable cost for the necessary plant, and where it is obtainable?"

Cement grout, forced in by means of compressed air, has been found very useful for filling up cracks and spaces which could not otherwise be dealt with. For instance, the cracks and fissures in the walls of Winchester Cathedral are being treated thus with complete success. We cannot, however, understand a competent architect suggesting such a treatment for faulty drains. It might be useful for repairing and filling up the joints of an old brick sewer, where the brickwork was crumbling or porous; but this would only be possible where the sewer was large enough for workmen to enter. Drains should be of iron or stonework pipes, and in the case of the latter, it would be impossible to grout with compressed air without opening down and uncovering the pipes. If the pipes are uncovered, it is obviously better, easier, and cheaper, to make fresh cement joints and reinstate any broken pipes. The most usual fault in drains is a stoppage due to a subsidence, or of the true gradient, or disturb-

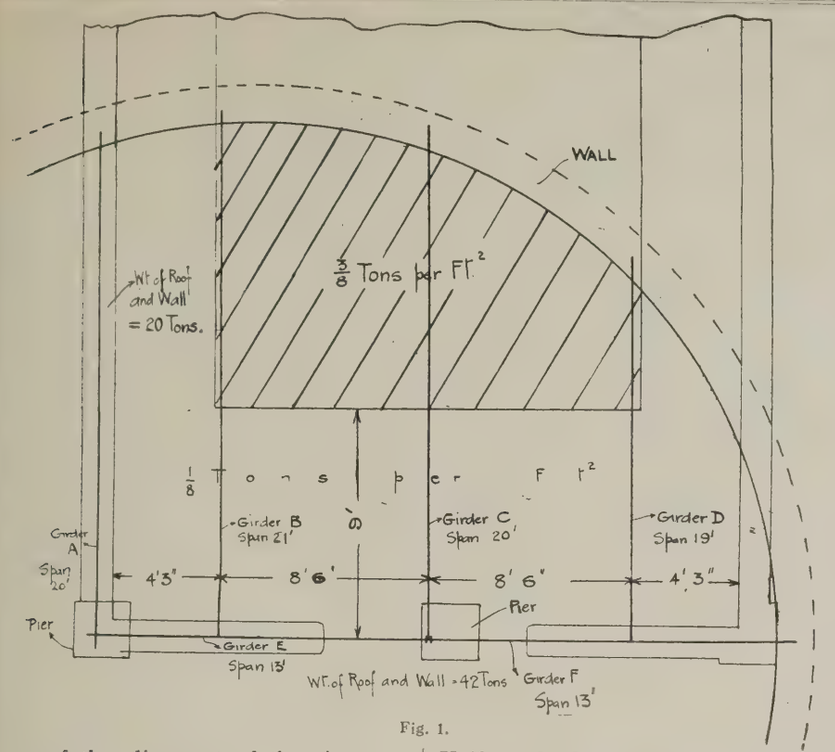

Fig. 1.

ance of the alignment of the pipes, or to their being crushed or broken. This cannot be remedied by grouting. The idea seems to us to be rather absurd.

Girders for a Building.

BARNSTAPLE.—S.E. DEVON writes: I should be glad if you would kindly favour me with the sizes, and the calculations to find same, for the six broad flange beams in the positions, and to carry the weights shown. A portion of a building I have to erect extends over some made ground (which made ground is enclosed by a wall, as shown on plan herewith). I have built piers, from rock foundation under, at the two points indicated to carry the girders, the other extremities of which will rest on the circular enclosing wall. The weights are figured, as also the clear spans between bearings. The girders carrying the front of the building will, of course, support the ends of the cross girders where shown.

Fig. 1 shows the plan of the building redrawn so as to give the effective spans of the six girders. The suitable sizes of the various girders are then found in the following manner:—Fig. 2 shows the Bending Moment diagrams.

Girder A. Load uniformly distributed = 20 tons from wall + $20{\cdot}5 \times \frac{4{\cdot}25}{2} \times \frac{1}{8}$ tons from the floor = 25·4 tons = W. $\therefore$ Max. B.M. $= \frac{WL}{8} = \frac{25{\cdot}4 \times 20 \times 12}{8}$ = 762 in tons. According to the theory of beams B.M. = f.Z, $\therefore$ taking f = 7 tons per sq. in. the necessary modulus $Z = \frac{762}{7}$ = 109 inch units. From the tables we see that one 12″ × 12″ or two 10″ × 10″ broad flange beams would be satisfactory; the latter will probably be preferable and give Z = 117·6; for the former Z = 103; for a 14″ × 12″ beam, Z = 144.

Girder B. The load consists of ⅛ ton per sq. ft. over an area $21 \times \left(\frac{4{\cdot}25}{2} + \frac{8{\cdot}5}{2}\right)$ sq. ft. + a load of $12 \times \frac{1}{4} \times \frac{8{\cdot}5}{2}$ over 12 ft. Uniform load over whole span = 16·6 tons $\therefore$ M $= \frac{16{\cdot}6 \times 21 \times 12}{8}$ = 522 in tons.

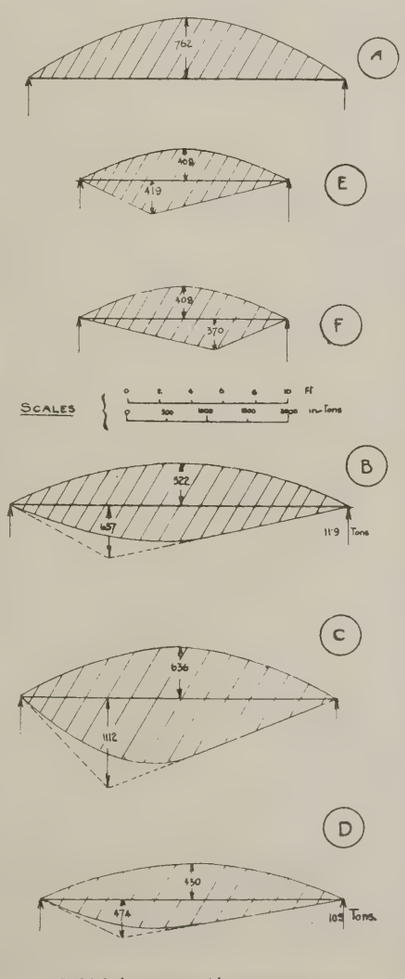

Fig. 2.

Uniform load over 12 ft. = 12.7 tons, for which the B.M. diagram is as indicated in Fig. 2. The max. combined B.M. = 900 in tons, $\therefore$ $Z = \frac{900}{7}$ = 129 inch units. Two 10″ × 10″ beams might be used for this although the Z is somewhat less or one 14″ × 12″ would be quite satisfactory. The reaction at the end resting on the girder E is equal to $\frac{16{\cdot}6}{2} + \frac{12{\cdot}7 \times 6}{21}$ = 11·9 tons.

Girder C. The uniform load over whole span = 21·2 tons and that over 11 ft. = 23·3. The diagram is similar to that of Girder B. Max. B. M. comes about 1420 in lbs. $\therefore$ $Z = \frac{1420}{7}$ = 203 $\therefore$ Two 12″ × 12″ or one 18″ × 12″ would do.

Girder D. The uniform load over whole span = 15·1 tons. The uniform load over 10 ft. = 10·7 tons. Max. B.M. = 780 $\therefore$ Z = 111. $\therefore$ Same sizes as for girder A will do.

Reaction at the end resting on girder F is equal to $\frac{15{\cdot}1}{2} + \frac{10{\cdot}7 \times 5}{19}$ = 10·47 tons.

Girder E. Take the weight from the wall as uniformly distributed over whole length, this being very nearly true, the max. B.M. due to this load = $\frac{21 \times 13 \times 12}{8}$ = 409 in tons. It also carries the reaction from girder B = 11.9 tons. Max. B.M. due to this = $\frac{11{\cdot}9 \times 4{\cdot}5 \times 8{\cdot}5 \times 12}{13}$ = 419. Max. combined B.M. = 780 in tons, nearly $\therefore$ $Z = \frac{780}{7}$ = 111. $\therefore$ Same sizes as for girder A will do.

Girder F. Uniform load is the same as in Girder E. $\therefore$ Max. B.M. due to it = 409 in tons. Reaction from girder D = 10·5 tons. $\therefore$ B.M. due to this = $\frac{419 \times 10{\cdot}5}{11{\cdot}9}$ = 370 in tons. Max. combined B.M. = 730. $\therefore$ $Z = \frac{730}{7}$ = 104 inch units, so that the same sizes as for girder A will do.

The Architectural and Topographical Society.

SILLOTH.—QUIZ 'EM writes: "Is the Architectural and Topographical Society of any help and benefit to a young architect? Where is the office of the society, and who is their secretary?"

The society you mention should be of particular value to young architects; but, having been started only this year, it has yet to make its influence felt. It has a very talented and influential advisory committee. Write to the hon. sec., Mr. Wilfred Travers, at 33, Old Queen Street, Westminster, S.W.

Sewerage Systems.

TAUNTON. — LEARNER writes: "Could you give me the address of publisher of a book on drainage for large areas; are there any books showing the size of sewer required per 1,000 of population?"

One of the most complete works on the subject is "Sanitary Engineering," by Colonel E. S. C. Moore, 32s. Others that may be recommended are: "Sanitary Engineering," by F. Wood, 8s. 6d. nett; "Designing, Construction, and Maintenance of Sewerage Systems," by A. Prescott Folwell, 12s. 6d. nett; and "Main Sewer Construction," by William H. Maxwell, 1s. All these can be obtained from this office, post free, at the prices mentioned. There are no rule-of-thumb methods to calculate size of sewers per 1,000 of the population.

Architectural Modelling.

HUDDERSFIELD.—H.F. writes: "Have you had any articles in previous volumes of THE BUILDERS' JOURNAL dealing with the making of architectural models in cardboard, clay, and plaster? Is it your intention to insert in your paper any such articles? Can you give me the titles of any good works on architectural modelling, and the prices of same?"

No, we have not published any such articles, and the work is not one that can well be learned from books. There is a book on "Architectural Modelling in Paper," by T. A. Richardson, which can be obtained for 1s. 6d., post free, from this office.

Books for Students of Architecture.

BIRMINGHAM.—A. M. B. H. writes: "It is inconvenient to attend the local classes in architecture, and I am desirous of passing the Board of Education Examination, and of eventually qualifying for Honours Certificate. I have already obtained a 1st in Stage II. Building Construction. Will you please say what books I should study?"

The enquiry is not worded quite explicitly, but we assume that the only subject in which A. M. H. B. wishes to prepare himself is Architecture. For this subject no books or drawings can take the place of personal study from the actual buildings, or, where these are not available, from remains and casts in the museums. He should certainly study whatever good Gothic and Renaissance examples his district affords, as well as such neighbouring places as Lichfield, Worcester, Warwick, and Coventry. Several carefully measured sketches should be prepared, preferably plotted on the spot, and pieces of enrichment should be drawn to a large scale. Mouldings, again, cannot be properly understood otherwise than by taking their profile carefully from the work itself, and noting the relation of one set to another, as, for instance, pier and arch moulds, mullion and jamb moulds, subsidiary and main vaulting ribs. Next in importance is the scale drawing from book illustrations of details. For this the Greek and Roman Order section, Mauch's 'Order Book," is perhaps the best; but Spiers's "Orders," supplemented by Mitchell's "Sheets of the Orders," will be found useful, if the first-mentioned book is not available. In the English Gothic section, Colling's books are undoubtedly the best, and should be supplemented by Jobbing and Dolman's "Analysis of Ancient Domestic Architecture in Great Britain." Alternatives to these are Brandon's "Analysis" and Pugin's "Examples." For the English Renaissance section, Gotch's plates on the early work, and Belcher and Macartney's on the later, are undoubtedly the best. Triggs and Tanner's books on the work of Inigo Jones, and on interior woodwork, are also very useful. The above are chiefly large books, but can probably be obtained temporarily for reference. The querist should certainly also be on the look-out for plates of measured drawings appearing in this journal from time to time. For general reading contemporaneously with the drawing, we would recommend the following as a useful series: Anderson and Spiers's "Architecture of Greece and Rome," Smith and Slater's "Classic and Early Christian Architecture," Smith and Poynter's "Gothic and Renaissance Architecture," Parker's "Introduction to the Study of Gothic Architecture" and "Glossary of Architectural Terms," and Blomfield's "History of Renaissance Architecture in England." Should A. M. B. H. require to prepare for Architectural Design as well, the basis of his study would be the above history, taken in conjunction with the Building Construction, which he has evidently already studied to some extent, and amplified by works on the principles of architectural designs. B. AND B.

Party Wall Question.

LONDON, E. W. N. A. writes: "A, the owner of five houses, has, without notice to B, pulled down his property, thereby making B's party wall an external wall. A has no intention of rebuilding. B has called upon A to make good the old party wall, to make it weather-proof, but A declines, and asserts that there is no law to compel him to do so. The property is in the East-end of London."

A appears to have demolished his own property merely and not to have in any way interfered with the party wall; nor does it appear that he has jeopardised the stability of B's property by his action. I am of opinion that, in these circumstances, B has no right of legal action against A, although it is quite true that he has exposed the party wall to the weather.

F. S. I.

Fitting a Fumigating Room.

TUNBRIDGE WELLS.—SAXON writes: "We shall be glad if you can inform us the best way to make and fix up a fumigating room for oak. We have a large shop, a portion of which, say, 22ft. by 10ft. by 9ft. pitch, we could partition off and make air-tight for the purpose. At present one end has a large window in it; would this have to be sealed up, or would it be sufficient to make it air-tight? We presume it would be possible and advisable to have a piece or two of clear glass in the partition through which we could see how much the oak work was fumigated.

The space you mention is unusually large for a fumigating room, and unless you have a very large amount of work to do, one-half the size would probably answer better, as it would save ammonia, which is, as you are doubtless aware, the fumigating agent. The great thing to see to in constructing the room is that it is quite air tight. Folding doors will probably be most convenient, and, if necessary, brown paper can be pasted over the cracks every time the room is used. The window will not affect the work, provided that it is rendered quite air-tight. You can, of course, put in a couple of "observation windows," if you wish, but you will find that the best plan of ascertaining how the work is proceeding is to bore holes in one or two places far apart, and to place in these plugs made from the same wood as that used in the article which is being fumigated, and a good deal longer than the casing through which they pass. These plugs will thus project into the room, and will be acted upon by the ammonia exactly the same as the article under treatment, and they can be withdrawn and examined from time to time and progress noted.

Success in fumigating depends upon three important points—(1) Subjecting the article to the fumes of strong ammonia for exactly the right time to produce the required depth of colour. This depends upon the strength of the ammonia, the size of the room, and the variety of wood, as some oaks are more susceptible to the fumes than others. (2) Absolute freedom from grease, such as might arise from touching the work with dirty hands; and (3) A careful stopping of nail holes and defects, not with ordinary putty, but with a mixture of oak sawdust, and a little glue, to which is added a drop of ammonia to bring it to the colour of the remainder of the work. If ordinary putty were used, it would be unaffected with the fumes, and every nail hole and defect stopped would show up and spoil the job. In a large fumigating room it is advisable to have two or even four saucers containing the ammonia distributed at equal intervals. J.

Practical Experience in Municipal Engineering.

BELFAST.—L.D.S. writes: "Can you give me any advice as to the steps I should take to obtain good practical experience in county and municipal works or waterworks engineering? I have graduated in the Royal University of Ireland in engineering with considerable distinction, being an exhibitioner and honoursman right through my course. I have held first place in every engineering examination in my college during the three years' course. I specialize in county and municipal work and waterworks engineering, and I should like to get practical experience in either of these branches. I should be glad if you could give me any advice as to what steps to take in order to obtain same."

Practical experience can only be gained by entering the offices of a municipal engineer, and great care and foresight is required to be exercised in the selection of the town. It is usual for the student to be articled to the engineer or the Council for from three to five years. This is rather a costly but more satisfactory method of gaining all-round experience. A progressive and rapidly growing town is the best to select, as there is always plenty of work in the Engineers' and Surveyors' Department, consisting chiefly of the inspection of new streets and buildings during construction, electric lighting and tramways, waterworks, and gasworks, street widenings, improvements, and making-up in accordance with the Public Health Acts, etc., etc. The examinations of the Institution of Municipal and County Engineers and the Royal Sanitary Institute should be passed by the candidate for a borough engineer's appointment in England. It is as well for the pupil to join the local fire-brigade so as to get a thorough knowledge of its administration and working, as it often occurs that the municipal engineer has supreme or executive control of this useful institution, and it is better that he should be competent to take the position of its captain. A study of architecture and mechanical engineering will always be found of use, and he should be conversant with the Public Health Acts, Highways Acts, Towns Clauses Acts, etc. All public meetings of the Council should be attended by the pupil, so as to gain an insight into the procedure adopted. If the student does not wish to be articled, he can offer his services as an improver at a small salary, but this is never so satisfactory as going through the regular routine of pupilage. Advertising in the technical journals for a pupil's or improver's position is generally resorted to with satisfactory results. The meetings of the Institution of Municipal and County Engineers, and their visits to various towns, should be regularly attended, as valuable information is gained thereby.

ASSOC. M. INST. C.E.

CONCRETE AND STEEL SECTION.

(MONTHLY.)

Theory and Experiment.

Although we have a well-defined and elaborate working theory of the distribution of stresses in materials and structural elements, it is nevertheless unwise to accept the theory as adequately established and fixed for all time. Multitudes of students, however, year after year, follow along the beaten tracks, and an army of practitioners are using the formulæ without apparently any cause to doubt its sufficiency. Occasionally collapses and accidents (like the Quebec Bridge disaster) occur to startle the architectural and engineering professions, but usually explanations are offered of ordinary precautions as to factors of safety having been reduced, or else the contractors are blamed for bad workmanship, and all goes on as before, without any material recasting of theory. Figuratively speaking, elaborate edifices are erected upon very questionable foundations, but the fact is not generally realised. The band of thinkers who enquire into essentials and foundational principles is small. In chemistry and physics there is not nearly so much stagnation in this respect as in engineering and applied mechanics, and in the former sciences we constantly hear of accepted theories being entirely superseded by others that are more accurate. As knowledge increases, earlier ideas of the nature of matter and force are constantly being abandoned for closer approximations to the truth. It takes years, however, before these world-shaking theories have any effect upon the architectural-engineering world. The explanation of why changes in theory in the abstract sciences take place so readily is that constant resort is had to experiment to verify a theory. We put it to the test. But in ordinary building construction and civil engineering, we seldom test anything. The theory of stresses in structures that we are working upon is based on the results of a few experiments conducted generally many years ago, made with apparatus not nearly delicate enough, and inadequately observed and recorded. The chief element of doubt is in the nature of internal stress in materials; but, even in respect to statics, there is room for close enquiry, for certain lines of enquiry have raised doubts. There is a *prima-facie* case for close investigation into everything afresh; for in all other directions of science theory has undergone radical changes. Study of many books on applied mechanics and engineering has convinced us that their authors, through want of practical acquaintance with the problems they treat, omit to realise points of difficulty, while other authors consciously evade them. The majority of authors are inadequately supplied with experimental data, and they follow each other as sheep follow the bell-wether. Few have ever experimented for themselves. Undoubtedly one of the great obstacles is that insufficient means are provided for experimental investigation; but, unfortunately, we do not make the most of what we have. Several engineering colleges possess means to conduct tests in respect to structural design, but the professors are mechanical or electrical engineers, and do not find interest in such problems. But we think if only they were approached by representatives of the architectural and civil engineering professions, and instructed in what to look for, they would assist to the best of their ability. Also the college authorities might be induced to lend their laboratories and appliances to be operated by civil engineer students. A few engineering colleges in the United States, Germany, and France are apparently all we have to rely upon for the meagre data they dole out from time to time, but the results are often only applicable to local practice. Steelwork and reinforced concrete are particularly in need of experimental study, as affecting both pure theory and practice. We may as well point out a few of the lines upon which we should like to see investigation. First, we would like to know the distribution of internal stresses from point to point in test specimens of varying ratio of length to diameter, and of various sections and at varying stages of loading in compression, tension, bending and torsion acting singly and combined in various homogeneous and composite materials. The nature of shearing force or diagonal tension and compression should be cleared up. Then we would like to have experimental investigation conducted to show whether we require to modify our statics as regards moment and ellipse of inertia, radius of gyration, and moments of resistance. The real position of the neutral surface in homogeneous and composite beams of various shaped sections, and of materials having the same and different moduli of elasticity, and the distribution of stresses above and below it, is much in doubt; *i.e.*, we want to know the shape of stress figures and the lever arm, and loadings should be concentrated, distributed and vibrating. Horizontal diagonal and vertical shear in beams requires investigation. Then the position of the pressure curve in arches, and the distribution of internal stresses is not well known, stresses in members sustaining combined tension and bending, compression and bending, and tension and torsion, compression and torsion, and bending and torsion, are likewise questionable. Stresses in struts are not nearly determinate at present. Stresses in flat and buckled plates and slabs and in domes have received little attention. The analysis of what are termed indeterminate structures such as some roof trusses, continuous elastic arches, etc., has proceeded in recent years on very inadequate data. Stresses in chimneys, with and without joints, poles, piles, pipes, retaining walls, all should be tested and undergo close analysis. Tests should be conducted both on a laboratory scale and on a large practical scale. Stresses in large members may be very different from those in small; for some conditions that are negligible in miniature become all-important when greatly magnified. If this enumeration of some of the more important lines of investigation seems extensive, it only shows how much we are in ignorance in dealing with engineering problems, and the great need there is for elightenment in even what appear to be simple problems. To realise the inadequacy of experimental investigation, and the indifference displayed, is annoying to the architect or engineer who understands something more than the rudiments of the subject, and appreciates the real difficulties of the problems of construction. With the majority of the professional public ignorance is bliss, and we can only expect an advance when our professors and teachers stop pretending they know all about the subject, and show students the difficulties of the subject in the absence of proper experimental investigation. Those in the position to do so should be urged to get together funds to undertake such work. Architectural and civil engineering are not less important than chemistry, electrical and mechanical engineering, medicine and other sciences, and therefore should be equally well supplied with testing laboratories and professors and staffs of assistants. It will require a good deal of money when so much is waiting to be done; but if other professions can solve the problem, why should not ours?

Reinforced Concrete Bridges in Italy.—On September 2nd the new bridge at Carate Brianza over the River Lambro was opened to traffic. This bridge is one of the largest and most interesting pieces of engineering work as yet constructed of reinforced concrete in Italy. It consists of two spans, of 188.5ft. each, and its total length is 459ft., its width 27ft., and it stands over 147ft. above the water. The work was started in December, 1905, and the first tests as to the reliability of the structure were conducted in August, 1907, when the bridge was loaded with ballast to the amount of about 250lb. per square foot, or double the weight for which it had been constructed. The results of the test were most satisfactory, as the deflection under the strain was found to be very small. The tests were subsequently continued with two and four wheeled vehicles, at various speeds, these including 20-ton road rollers, 10-ton road locomotives, and 6-ton wagons. The works were carried under contract by the Societa Italiana Costruzioni e Cementi Armati, who have been executing some very important works in reinforced concrete in Italy.

* * *

Another bridge of reinforced concrete, spanning the River Magra at Costigliole, on the new road from Caprigliola to Spezzia, has been opened to traffic. The bridge is 984ft. long, 24ft. wide, and it stands about 33ft. in the clear above the normal water level. It consists of five spans, or arches, each with a chord of 166ft., and the deck is supported by 400 pillars of reinforced concrete.

* * *

The Perfector Bar Reinforced Concrete Co. report that they have in hand the following important contracts:—A large seven-storey factory building; a fireproof warehouse, 120ft. by 190ft., with subways; a large waterside warehouse; and more than two acres of roofs: in all about £140,000 worth of work. This company, we are informed, is in a position to roll bars 80ft. in length, and they claim that their plant is the finest in Europe.

FORMS FOR REINFORCED CONCRETE.—III.

(*Continued from p.* 183, *No.* 709.)

In Part II. of this article, we passed in review various forms of centering for reinforced concrete floors in which the main and secondary beams were of steel, and began to deal with floors that are completely constructed of reinforced concrete, including the beams. We shall now conclude our description of centering for such floors, and proceed to other details of construction; but, as a preliminary, we reproduce Fig. 19, which was omitted from the second article of this series. This illustration applies to the division of the subject relating to floors having steel beams, and the form of centering shown is of the suspended type, but differs considerably from the ordinary method of hanging the centering from the steel. We are indebted to the Patent Indented Steel Bar Co., Ltd., of Queen Anne's Chambers, Westminster, for this illustration, the floor in question being in the Albert Mills, South Reddish, near Manchester (Messrs. Potts, Son and Hennings, architects). The floors and roof throughout were reinforced with indented bars, and the contractor for the concreting was Mr. B. Morton. It will be seen that the floor is not divided into panels, but into long bays of more than customary span. The centering boards consequently needed a supporting deal or batten which, in the ordinary way, would have been propped from under; but the method adopted by the contractor eliminated such an obstruction to the clear space below. The support at the centre of the span was given by suspending the bearers by rods passing through the floor and hung from a kind of shear-legs construction overhead.

We will now resume the consideration of forms for floors with beams of reinforced concrete. At the end of Part II. we referred to the "core-box" type of form, but only had space to deal with the "panel" construction. We now proceed to describe and illustrate the "core-box" construction. The beams in the panel type are formed by boxes, but, instead of supporting bearers and boards upon these beam boxes, in the core-box type the concrete for the floor slabs between beams is applied to the top of an inverted box, and the sides of the latter form the sides of the beams, only a bottom board being necessary to support the soffit of the beam in moulding. Such a method of construction is only economical where the lay-out of the beams is regular and uniform, so as to permit of the use of the core-boxes repeatedly without alteration. Such a method of centering, where possible of adoption, has the advantage of great rapidity in construction, for the boxes can be re-erected in a very short time after striking, and is economical of labour and materials.

Figs. 28 and 29 show the core box type of form. It will be seen how in this type a box is made out the size of the sides of the beams combining the sides of the girders with the floor panel. On the sides of the box a stringer supports the bottom board of the beam. The ends of such boxes are, as a rule, supported on a fully-shaped girder trough.

Fig. 28 is a form employed by the Pacific Borax Company's Works, Constable Hook, N.J., belonging to the box type. The bottom of the beams was formed by boards (C) resting upon cleats (D) to facilitate removal. The boxes were cut in halves along the plane (AB), the two halves being clamped together by the slotted plates (E), which, when loosened, allowed the two parts to slide, and so partly collapse the mould. A somewhat similar type of form is shown in Fig. 29, but here the arrangement for collapsing the mould consists of a longitudinal hinged joint in the top sheeting, the two halves falling together when the cross pieces at the bottom are removed.

FIG 19. SUSPENDED CENTERING FOR REINFORCED CONCRETE FLOOR.

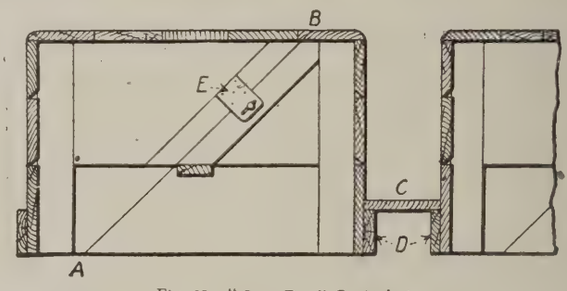

Fig. 28. "Core Box" Centering.

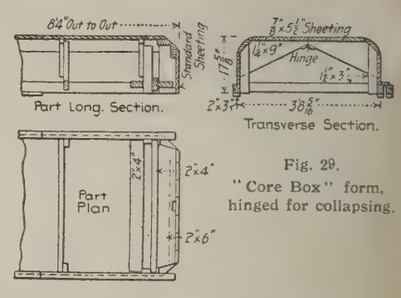

Fig. 29. "Core Box" form, hinged for collapsing.

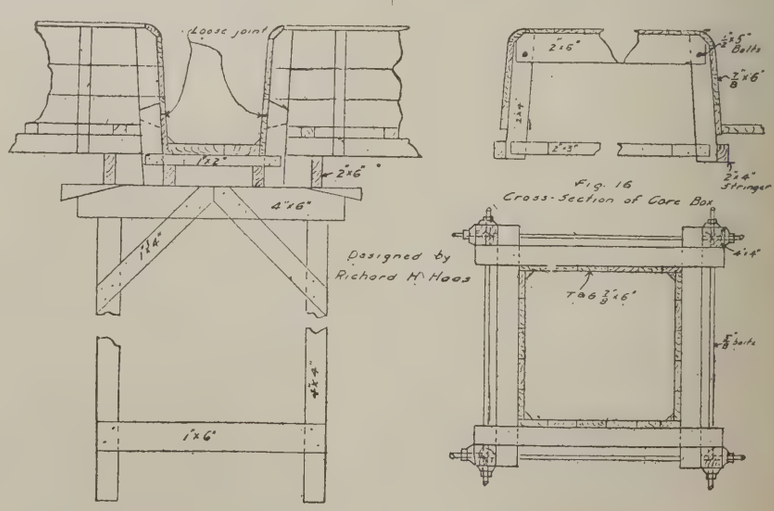

Fig. 30. A "Core Box" form.

Fig. 30 shows a detail of similar construction adopted in the erection of a building in Jersey City, U.S.A., which was practically the same as used for the construction of the American Tobacco Company's premises in Montreal, Canada. It is interesting to note in connection with this building that the plant for the carpenters consisted of a carpenters' shop, in which was installed a circular saw, a boring machine, a bolt-threading machine, and a grinding stone. The carpenters were all divided into different gangs under sub-foremen, and each gang had only one particular part of the whole of the form construction to do, the idea being that in this way one gang was continually pushing the other. In wrecking these forms the supports of the 2in. by 6in. bearers were removed first, which was easily done by simply loosening the wedges. The men then worked from movable platforms, pulling the boxes away by jarring them, and as quickly as the forms were removed they were repaired when necessary and hoisted into a fresh position. The following figures were noted by the superintendent on this building, and afford useful data in connection with other work, if we note that the carpenters were paid at the rate of 35 cents per hour, and the labourers at 17½ cents per hour.

Labour on Construction.

Columns	.4½	cents per sq. ft.
All forms	.07	do. ,, ,, ,,
Supports	.65	do. ,, ,, ,,

Labour on Erection.

Columns	.03	cents per sq. ft.
All forms	.033	do. ,, ,, ,,
Wrecking	.008	do. ,, ,, ,,

In a general way the supports are independent and sometimes wedged from the bottom of the posts, but there are disadvantages in this method, and the plan shown in Fig. 30 is a good one. The supports in this case are framed and made of correct height, and the frames are simply set at regular required distances from each other in a straight line, and braced horizontally one way. Upon these 2in. by 6in. or 2in. by 9in. joists are placed, and wedged up as shown. The wedges are driven up so as to get the forms exactly level.

In core-box construction, when beams are nearly uniform in width and the building is of same magnitude, the sides of beams may be given a slope of ¾in. in 12ins.

Fig. 31 shows an economical method of designing forms. The bottoms of the beams, it will be noticed, are supported on the horizontal clamps of the column forms, while the beam forms are supported on the bottom of the girders; thus all the forms for a floor may be erected before any struts are put in. After the beams are in place the struts or posts may be put in at any time and wedged up without any lateral pressing whatever, and by this method time and labour are saved. If 2in. timber is used for the beams they must be at least 2in. shallower than the girders, in order that the forms may rest on the girder bottoms. In the section BB the wedge-shaped pieces are keys inserted to facilitate removal of the forms. The floor slab, in this case, it will be seen, is designed to be retained by a panel and not by a box. The panel form, it may be here noted, has the advantage of taking up any slight errors in line at the junction between the panel and the side of the beam, and a slight variation in this dimension is not conspicuous. In removing such a form the column forms are first taken away without disturbing the beams and girder forms. Next the posts are taken from under the girders, which allows the bottom of the latter to drop. The posts are then immediately replaced, the nails are drawn from the key, which is only nailed to the side of the girder form, the key is knocked out, the posts are taken from under the beam, the so-called "spreaders" are knocked from under the slab panel, and the beam form comes down in one piece. The sides of the girder forms, which are bevelled at the ends, come out easily, as also does the slab panel, which is bevelled on all four edges.

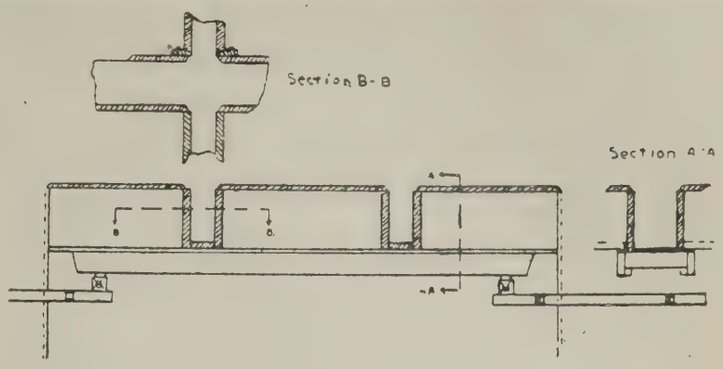

Fig 31. An economical form.

In removing or striking forms generally it may be noted that the columns should always be wrecked first, as in this way any defects can be discovered and remedied before the removal of the supports. Core boxes come away easily by jarring, and panels come away easily by springing.

Fig. 32 shows a design by Mr. R. W. Maxton, an American engineer, for beam and floor forms. Sometimes the beam and girder forms are made 1in. wider at the top than at the bottom, so as to help in taking down. As regards the cross section, attention is directed to the bevelled board provided at the centre of each span. After the removable board is down, this bevelled board is taken down and removed through the gap shown. After one board is removed, the rest of the flooring is easily taken down. After all the flooring is removed, and the clamps have been taken down, the sides of the beam are spread apart and the beam form is taken down. Mr. Maxton, we may here mention, advocated the placing of 6in. by 6in. props (when required) under all girders and beams, with their lower ends resting *in all cases* at the base of the columns, converging at the top towards the centre of the girders, where they are united by a cross-piece forming a head about 4ft. across. In this way the entire load of the floor under construction is carried at the columns, and not super-imposed upon the floor panel below. Forms from any one floor can thus be taken down without jeopardising the floors below.

Column moulds.

Forms for square posts or columns are made, as a rule, with one side left open, this fourth side being brought up as the concrete is deposited. Occasionally, however, all four sides are brought up as the concrete is being applied, and in some cases they are all formed to the full height, and the concrete is poured in at the top. If all four sides were constructed completely to start with, and the concrete were poured in from the top, it would be difficult to ram, and would therefore have to be made very wet; even then it would not give sufficient density.

Another method is to use four sides completely erected, but only in short lengths. Where three sides only are put in position at first, they are formed by placing boards vertically and held by horizontal cross-pieces nailed thereto. The fourth side is then brought up with boards placed horizontally, as shown in Fig. 33. In the case of forms that are brought up all four sides together bit by bit, horizontal boards are used throughout, held in position by four battens at the angles.

The edges of the columns are chamfered, as it is difficult to keep sharp arrises when removing the forms. These are formed by placing angular strips in the inside corners of the forms.

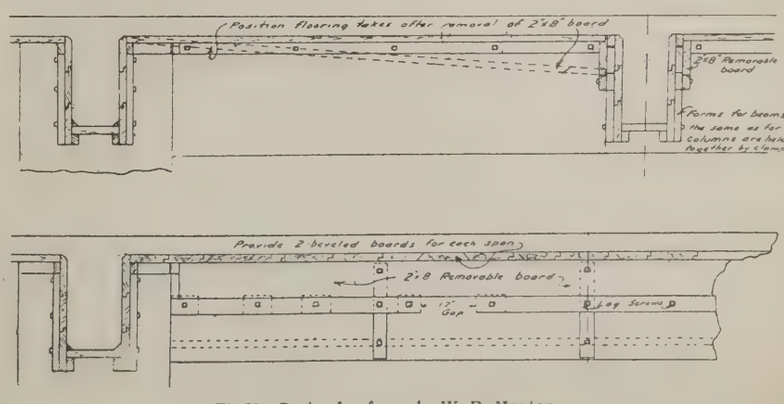

Fig 32. Design for forms by W. R. Maxton.

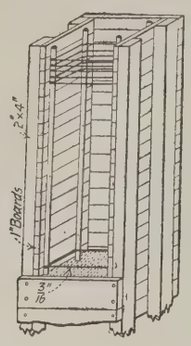

Fig. 33. Column form.

For round columns, as a rule, drums built in two halves are usually employed, one or both of which may be brought up in short sections as the concrete is packed therein.

Exterior columns are usually made square for architectural reasons, but the interior columns are often octagonal, partly for the sake of appearance, and partly to save concrete; this being due to the fact that in a column reinforced spirally the concrete outside the spiral is not considered as adding to the compressive strength of the column, so that if it is square the concrete in the four corners is wasted. The elaboration that this entails in the form work involves additional expense, and it is questionable whether the saving in the concrete offsets the extra labour. As a rule, however, the two items about counterbalance each other, so that the appearance may be studied without being influenced by considerations of economy.

The sides of column forms are in some cases made up of narrow strips, which arrangement is advisable, as it facilitates the reduction of the size of the columns from floor to floor. In the ordinary way, it is not necessary to have more column forms than a complete set for one storey of a building, unless this one storey is being erected every five or six days. Therefore, as the column forms are used again and again, it is economical to reduce the diameter of the column by means of ripping off these narrow strips of timber, and it is much cheaper to have these cut beforehand than to have a carpenter saw off a strip for each successive storey. Often the outside and inside of the exterior column forms need not be made of narrow strips, because the exterior columns are of the same width the whole way up the building; the reduction in the section is effected by reducing the thickness only.

We may first consider in detail a column form constructed with four sides raised all together, but in sections—to enable proper homogeneity to be secured in the concrete. Fig. 34 shows a section of a column made by nailing boards placed upright to vertical battens. The four battens are braced with cleats horizontally, the projecting ends of these cleats being notched to provide for tie-rods with screw-nuts, which tighten and clamp the form together. The tops of the vertical battens are also notched to provide for stringers stretching from column to column to carry the floor forms. The third and fourth sides are formed by dropping short lengths of boards in between the other sides, which are nailed to the battens, the length of these short lengths being arranged so that the joints come behind the cleats. If the

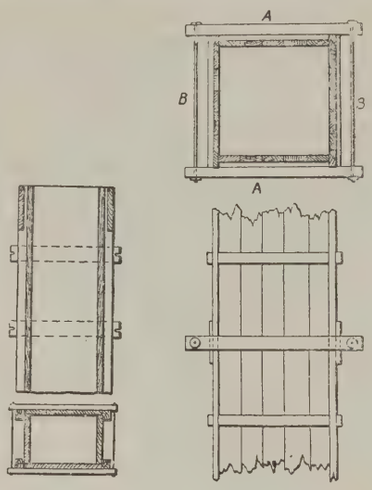

Fig. 34. Column form.

Fig. 37. Column form with vertical boarding.

battens were first erected, the whole four sides could be brought up gradually in short lengths, so as to leave all sides open for concreting. Such a form is simple, but it is not applicable to all circumstances.

Fig. 35 shows a similar type of form, with vertical boarding. The clamps are of different shape, however, and two boards are used on each face, united by cleats, and vertical battens are done away with. Fig. 36 shows the same job with several column moulds and beam forms in position. The work shown in course of construction in these two views appertains to a warehouse at Leeds, erected for Messrs. Peter Laycock, Ltd., of Perseverance Mills, Leeds. This warehouse is used for a cloth store, and is two storeys high. The building measures about 136ft. by 38ft. The first floor, and beams and columns supporting same, are formed of reinforced concrete, and the ground floor is of ordinary plain concrete. All the floors are finished with a topping of Granolithic concrete. The roof is carried by iron columns, and covered with Vulcanite. As regards the reinforced concrete work, the form of reinforcement

Fig. 35. Column mould in use in a Leeds warehouse.

throughout is that of indented steel bars, supplied by the Patent Indented Steel Bar Co., Ltd. The architect for the work is Mr. Ascough Chapman, A.R.I.B.A., of Prudential Buildings, Park Row, Leeds, while the clerk of the works was Mr. John Park. The contractors for the reinforced concrete work were Messrs. A. Walker and Sons.

2x4 clear
2x4 clear

Fig. 40 shows beam and column moulds designed by Mr. Robert A. Cummings. Their construction is shown by the illustrations, but we may note that the column mould is made in eight separate parts, which consist of four corner moulds and four intermediate sides; while, in order to hold the sides of the beam forms against the bottom board, a 2in. by 4in. runner with wedges against it is used.

Fig. 41 shows a very usual type where three sides of the column form are completely erected with vertical boards, and the fourth is brought up with horizontal boards. Its construction is clearly shown in the diagram, A, B, and C being the vertical sides, D a clamp for holding them in position, and E the horizontally boarded side.

Fig. 42 shows a similar form, arranged for moulding an octagonal column. This is built with four separate side pieces of 5½in. by ⅞in. planed boards having one bevelled edge and one square edge. On two opposite sides the boards are vertical, and are nailed to the edges of horizontal cleats; the other two sides are made of horizontal boards nailed to a pair of outside vertical cleats. The horizontal cleats project beyond the sides of the mould, and are slotted to receive the tie-rods that clamp the four sides of the mould together. The topmost cleats project about 2ft. beyond the sides of the mould, and are made heavy enough to carry the main beam forms as shown in the figure. Vertical struts reaching to the floor below support the ends of these long cleats.

Fig. 33 shows a form in which all four sides were made with horizontal boards, which could, if desired, have been raised gradually all at the same time as the concreting was done. The view shows three sides completed, however, and the fourth only being brought up with the concrete. It shows also how the horizontal reinforcements were all assembled temporarily before beginning the concreting, at the top; the ties could thus be slid down into position without delay.

Figs. 43 and 44 show forms for more elaborate columns. The former was made of wooden staves, dowelled together and hooped with adjustable iron straps. The other, for a fluted column, was formed of 24 laggings dowelled together and hooped round with adjustable wooden bands. The flutes were formed by plaster of Paris moulds attached to the inside by screws. In removing, these screws were first drawn and then the staves taken away; the plaster flutes remaining as a protection to the column until the building was practically finished.

(To be continued.)

REINFORCED CONCRETE IN COLLIERY WORK.—The Londonderry Collieries, Ltd., have recently adopted reinforced concrete on the Kahn system for the heapstead and screening-house floors at their new colliery at Dawdon, Seaham Harbour, the total area covered being about 2,500 square yards. The main girders consist of rolled steel joists of 35ft. span, spaced 11ft. to 14ft. between centres. Between these the Kahn secondary beams, 16in. by 8in., are placed at about 6ft. centres, and over these is a 4in. thick Kahn floor. The floor was designed for a safe live load of 184lb. per sq. ft. This is probably one of the first applications of reinforced concrete for pit-bank buildings; and its further use for these erections may be confidently expected.

Views and Reviews.

Calculations for Reinforced Concrete.

M. Nivet is a manufacturer of hydraulic limes, and in the course of his daily work has had to conduct many tests on the resistance of concretes, limes, and cements. He was thus led in 1889 to construct a testing machine, with which he has conducted tests for bending, tension, shearing, and crushing on specimens having the dimensions 2 cm. by 2 cm. by 11 cm. The results obtained with the same measuring instrument are comparable, and have led M. Nivet to discover a law regarding the bending strength of materials which he communicated to the French Association for the Advancement of Science at the Congress at Cherbourg in August, 1905. He has examined from this point of view the results of tests and investigations recorded by the French Ministerial Commission on Reinforced Concrete, and thinks they confirm his theory. He has therefore written this treatise, in which he develops methods of calculating the resistance of reinforced concrete, based upon his conclusions. The basis of his theory is as follows:—

Testing a series of prisms of lime and cement 11 cm. long by 2 cm. square, resting on two supports distant 10 cm. apart, by applying a breaking load at the centre, the average load-producing rupture was found to be:—

$$= 19{\cdot}5 \text{ kg.}$$

Similar prisms, when tested for tension, gave the following average result:

$$T = 16{\cdot}79 \text{ kg.}$$

and for crushing:

$$C = 169{\cdot}25 \text{ kg.}$$

Calling the span of the prism, between the supports, $l = 10$, $a = 2$ its sectional width, and $H = 2$ its sectional depth, the theoretical formula for plane bending gives (calling R the resistance of a solid per sq. m., both for tension and compression) in the case of a solid loaded with a weight P applied at the middle of the span,

$$R = \frac{3\,Pl}{2a\,H^2} \quad \ldots\ldots\ldots\ldots (1)$$

This formula is based equally upon the hypothesis that the fibres situated on the side where the weight P is applied are compressed down to the middle of the depth of the prism and those of the second half are in tension, the plane of the fibres which are neither in compression nor in tension, which is called the neutral surface, being found at the middle of the prism.

In order to apply formula (1) to the test prisms it is necessary to replace R by T and C, that is to say, by two quantities very different, because C is generally, for concretes, equal to T × 10, as we see above.

The theoretical formula for the bending plane is therefore not applicable to the case of concretes. However, introducing into formula (1) the quantity C we find a value of H, which we may call H_c; we shall have:

$$C = \frac{3\,Pl}{2a\,H_c^2} \quad \ldots\ldots\ldots\ldots (2)$$

Making a similar calculation by replacing R by T and making H_t the corresponding depth we shall have:

$$T = \frac{3\,P}{2a\,H_t^2} \quad \ldots\ldots\ldots\ldots (3)$$

If we put in formulæ (2) and (3) the values C, T, P, l and a found above we shall have:

$$H_c = \cdot 092158 \text{ cm.}$$
$$H_t = 3\cdot 0764 \text{ cm.}$$

Formula (2) determines the height H_c of a hypothetical prism of which the resistances to crushing and tension will be equal to each other and equal to C, the axis of the neutral fibres being situated at the middle, at the distance $\frac{H_c}{2}$ from the top and bottom.

Similarly, formula (3) gives the depth H_t of a hypothetical prism of which the resistances to tension and crushing will be equal to each other and equal to T; in this prism the plane of the neutral fibres will be situated at the distance $\frac{H}{2}$ from the top and bottom.

If we combine the compressed half of the prism H_c with the extended half of the prism H_t, we shall have a solid which ought to have the same resistance as the hypothetical prisms H_c and H_t, and as the experimental prisms, and breaking under the same load P.

This is confirmed by experiment, because the solid so formed is no other than the prism which has served for the conduct of the tests.

In short, if we add $\frac{H_c}{2}$ and $\frac{H_t}{2}$, we shall have a depth nearly approaching H:

$$\frac{H_c}{2} = \cdot 46079_{cm} \qquad \frac{H_c}{2} + \frac{H_t}{2} = H \ldots . (4)$$
$$\frac{H_t}{2} = 1\cdot 5382$$
$$\text{Total } 1\cdot 99899 = 2_{cm}$$

In the solid so formed by the half of the prism H_c and the half of the prism H_t united by the plane of their neutral fibres, this common plane will divide the depth H in the ratio $\frac{H_c}{H_t}$

Also, if we divide formulæ (2) and (3) which have served to calculate H_c and H_t the one by the other we obtain:—

$$\frac{H_c}{H_t} = \sqrt{\frac{T}{C}} ,$$

that is to say, *the plane of the neutral fibres* (neutral axis or neutral surface) *divides the depth of the prism in the inverse ratio of the square roots of the coefficients of tension and compression.*

This is the law for concretes subjected to bending, at the moment preceding rupture, in a prismatic piece which M. Nivet enumerates. This same law appears to hold good for all homogeneous bodies not of a laminated structure, the ratio only altering, and this ratio is a characteristic of matter.

We have already noted that in concretes the coefficient of compression is equal to ten times that of tension:

$$C = 10\ T.$$

The proportion therefore becomes:—

$$\frac{H_t}{H_c} = \sqrt{10} = 3\cdot 162 \ldots \ldots \ldots (5)$$

We are able, then, by the aid of formulæ (4) and (5) to calculate H_t and H_c, and putting these values in the equations (2) and (3) to obtain the quantities T and C when experiment has given P, that is to say, to determine, without direct testing, these two coefficients.

We are so enabled to find, by a simple calculation, for each experiment, the loads which produce fracture in tension and compression of a test piece of lime or cement, when we only know the force which produces rupture by bending, and rarely is the method in error if the test piece does not present some defect in homogeneity.

Observations have been made on prisms of ice at—7°, and on various metals and alloys. In each case the ratio $\frac{H_t}{H_c}$ alters, but it appears to be fixed for each kind of body between certain limits; this must be a characteristic of all matter.

For ice at —7° we have $\frac{H_t}{H_c} = 1\cdot 829$

For steel ..... $\frac{H_t}{H_c} = 1\cdot 13$

The method of making calculations for reinforced concrete developed by the author in this book conforms to the requirement of the French Commission on Reinforced Concrete that any system of calculations adopted for designing shall be based on theory. M. Nivet's system of calculations is based on defining the position of the neutral surface by the above method, considering the concrete alone and then calculating the steel as stressed to the full at whatever depth remains, but he disregards the fact that the position of the neutral axis depends upon the proportion of steel. He gives an example of how he would calculate a floor measuring 14.1 metres by 7.1 metres, and compares his solution to the dimensions of the various parts adopted by one of the Hennebique licensees for a floor of exactly similar span. It seems to be the custom in France for authors of theories of reinforced concrete to compare their methods with the Hennebique method, which has been so extensively applied that it affords the proof of practical experience. M. Nivet's method of calculation, when compared with the Hennebique solution for this typical floor, shows that he requires considerable increase of material in every direction, namely, in weight about 16 per cent. more concrete and 30 per cent. more steel, or 13.4 per cent. extra total weight of materials per square metre. His method, however, in our opinion, errs in theory in respect to estimating the same parts to be stressed to the full at several stages: thus, first, he calculates the floor slab to resist full stresses as the table of the main T beams; he then requires the floor slab to serve as the table to the secondary T beams; and finally considers it as a floor slab simple in beam action between the beams. He thus calls upon the floor slab to sustain the limit of stress on three different occasions, and though there are certain factors which tend to correct this, it is obvious that the system cannot be called a truly analytical one, and it would not be safe to rely upon it for all circumstances, or even for the majority of cases that arise in practice.

The book contains 75 pages of numerical tables which should be of considerable service to many persons who employ reinforced concrete. The work is a valuable contribution to the theory of applied mechanics

"Méthode de Calcul du Béton Armé, avec barèmes pour en déterminer les dimensions." Par A. Nivet, ingenieur, E.C.P. (1863), manufacturer of hydraulic limes. Paris: H. Dunod et E. Pinat, éditeurs. 49 Quai des Grands-Augustins. Price: 7 francs, in paper covers.

STRESSES IN ROOF TRUSSES.

BY MAX AM ENDE.

In an article on "The Disposal of Horizontal Forces on Iron Roofs," published in THE BUILDERS' JOURNAL for January 2nd, 1907, where roof trusses without redundant members, *i.e.*, statically determinate systems, were discussed, it was stated that no stress calculation could be made without having previously determined the reactions of the supports or abutments, as otherwise the forces acting on the system would be incomplete. It is now intended to show how the stresses in the redundant bars of *indeterminate systems* can be calculated, and how the abutment reactions can be found in those cases where they are affected by such stresses. But before doing so it will be expedient to explain briefly the method or methods of calculating the stresses in systems *without* redundant members, *i.e.*, statically determinate systems, all forces and reactions being known.

We have a graphical and a calculative method, the former being based upon the theorem of the parallelogram (or polygon) of forces, and the latter on the theorem of moments, according to which *the sum of the moments of all forces on a system or part of a system in equilibrium, taken on any chosen fulcrum, must be nil.*

Using the graphical method, we express the amount and direction of a force by a line of a measured length, and obtain by the side of the drawing of the system those attractive reciprocal figures on which the stresses are measured by a given scale. In the calculative method we can generally find the stress in any one member or bar, without having previously determined the stress in any other. This renders the calculative method more suitable in most cases, and especially here, where brevity is desirable.

The calculative method is also called the *section method.*

When all the outer forces, including the abutment reactions, are given, as in the truss Fig. 1, we imagine the system to be cut in two where the stresses are to be calculated. Such cut, for example the cut *aa*, Fig. 1a, will, as a rule, go through three bars, namely 3, 8 and 14. Then each of the two parts will be in equilibrium if we impart to the three cut bars the stresses which were in them, and, regarding them as outer forces, we have these now complete for each part, although three of them, S_3, S_{14}, and S_8 are yet unknown in respect of magnitude and direction. Assuming the latter as indicated by the arrows, and considering that the sum of the *moments of all forces upon any assumed point as a fulcrum must be nil,* we could set up any number of equations with three unknown quantities for each of the two parts. Assuming, then, as fulcrum, the intersections of two of the bars 3, 14, 8, we have only one unknown quantity in the equation, and the stress in the third bar can be found. If the result is positive, the force would be in the assumed direction of the arrow, and the stress therefore tensile; if negative, it would be in the opposite direction, and the stress compressive. The other part, not shown in Fig 1A, if treated in the same way would give the same result. Regarding moments turning *with* the hand of the clock as *positive* and those turning against it as negative we have as follows:—

Bar 3: $0 = +9{\cdot}8\ S_3 + 30\ V - (10+20)\ F$
Bar 8: $0 = -8{\cdot}7\ S_8 + 20\ V - 10\ F$
Bar 14: $0 = +43{\cdot}5\ S_{14} - 27\ V + (37+47)\ F$, and using the cut b-b
Bar 15: $0 = -36{\cdot}5\ S_{15} - 6{\cdot}5\ V + (16{\cdot}5 + 26{\cdot}5)\ F$ (1)

F and H are given, say $F = 1{\cdot}4^t$ and $H = 3^t$. Then $V = 5{\cdot}5^t$. Putting this into the above equations, we find :—

$$S_3 + - 12{\cdot}5^t;\ S_8 = + 11{\cdot}2;\ S_{14} = + 0{\cdot}7^t;\ S_{15} = + 0{\cdot}67^t.$$

If the fulcrum falls outside the drawing, a diagram can be made to a smaller scale. This is done for the diagonal 18 in Fig. 1a, the scale being one quarter of that of the drawing. We have :—

$$0 = + 215\ S_{18} - 243V + (253 + 263 + 273 + 283)\ F$$

and with $F = 1{\cdot}4^t$ and $V = 5{\cdot}5^t$

$$0 = 215 S_{18} - 1336{\cdot}5 + 1500{\cdot}8$$
$$S_{18} = - 0{\cdot}79^t.$$

If, in order to dispense with the small scale diagram, we regarded 5 and 6 as parallel, and resolved the forces into the directions of 5 or 6 and 18, we should find $S_{18} = - 0{\cdot}12^t$, which is hardly correct enough.

The section for finding the stresses S_1 and S_{10} cuts only two bars, and the fulcrum for 10 is then assumed in any point of 1, or *vice versa*. Both stresses can also be found by the parallelogram of forces.

The statically determinate system, Fig. 2 is one of the exceptions to the rule that a section should not cut through more than three bars. For example, in order to calculate S_3, the section a—a is made, cutting through four bars. But S_{14} can first be found with the section c—c, and then S_3 with a—a and fulcrum f_3, or S_{12} may be found direct by the parallelogram of forces, as it is independent of all forces except F_3. The rule, therefore, is not an unfailing test for distinguishing determinate from indeterminate systems.

The proper test is that the number of bars (including the three bars V, V', and H, Fig. 1, required to support the system) should be double the number of junction points, or, if n is the number of bars without the supporting bars, and p the number of junction points

$$n + 3 = 2p \quad (2)$$

This test applies to systems in a plane. For systems in space the number of bars is threefold the number of junction points, or, as six supporting bars are required : $n + 6 = 3p$.

If the number of bars $n < 2p - 3$, the system would collapse, assuming, as we do throughout the present discussion, that the bars are connected at their ends by means of hinges. On the contrary, if $n > 2p - 3$, the system is one *with redundant bars*.

For example, a straight tie connecting points A and B, Fig. 1, would be a redundant bar, and a counter diagonal in the panel 5, 17, 6, 19, would be a second redundant bar. The effect of the presence of such bars upon the stresses calculated above depends upon their sectional area, a, the modulus of the elasticity of the material E, and the dimensions of the n bars of the structure, as also upon the process of erection. The effect of the bar AB must be different whether it is fixed while the structure is completely supported on scaffolding, and therefore without stress, or whether it is fixed after removal of the supports, or after, in some artificial way, or otherwise, initial stresses have been imparted to it. In any case, it is impossible to know what the stresses actually are in the complete

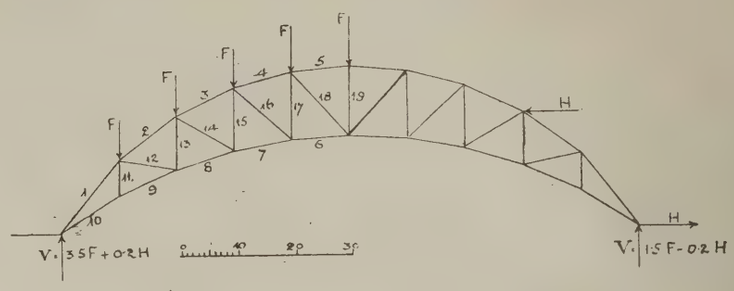

Fig. 1.

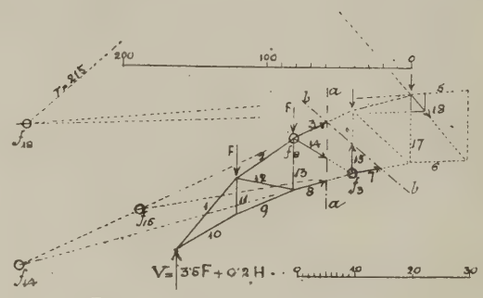

Fig. 1 A.

structure unless the process of erection has been properly controlled and recorded. With some engineers this has always been one reason to avoid redundant bars in structures, besides the other reason, in early times, that no method was known how to calculate the stresses in them. And it is curious to note that, since the latter objection has been removed and the effects of redundant parts are more accurately appreciated, the reluctance to employ such structures has generally increased. But they cannot always be avoided, and a method for their calculation is therefore indispensable.

The beam continuous over several supports and the curved beam or arch fixed at both ends can be regarded as structures with redundant parts. In the former case these are the intermediate supports, while in the latter case they are represented by the superabundant means of supporting the ends, which amount to three additional supports.

Methods for calculating the stresses in these solid structures and their deflections from the elastic deformation of their elements have been in use for a long time, but these older methods are not directly applicable to systems of bars. The latter could not be calculated until the principle of virtual displacements of the junction points, together with the principle of work or of the conservation of energy, was applied to them.

The principle of work is this : *the work of the forces acting upon a system of interdependent points* (produce of pressure and stroke) *is equal to the work of the resistances in the system.*

Applied to elastic systems of bars it is : *The virtual work of the outer forces* (as the system yields under them) *is equal to the work of the stresses causing the virtual changes of length of the bars.*

The invention of a practical method of calculation based upon this principle may be regarded as the solution of almost all stress problems of systems consisting of elastic parts.

Let, Fig. 3 :

n be the number of bars in the determinate system A....N.

S_x the stress from all forces in one of the n bars.

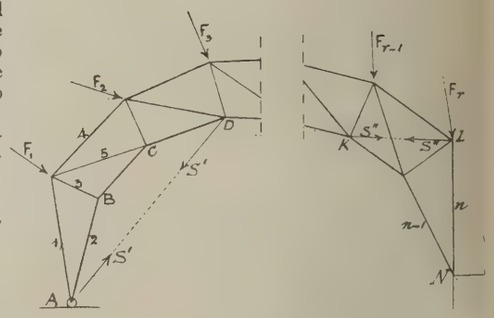

Fig. 3.

Δl_x the elastic extension of the same bar, whose length is l_x.

$m_x = \frac{l_x}{a_x E}$ (where a_x is the sectional area and E the modulus of elasticity of the material) the extensibility, so that $\Delta l_x = S_x m_x$.

$F_1, F_2, F_3 \ldots F_r$ outer forces, F_u one their number r.

$\sigma_1, \sigma_2, \sigma_3 \ldots \sigma_r$ the stresses in any one of the n bars due to the unit of F; therefore $\sigma_u F_u$ the stress from F_u,

$d_1, d_2, d_3 \ldots d_r$ the small movements of the points of application of the forces in the direction of the forces. During the movement d the force increases from nil to F and $\frac{Fd}{2}$ is the mechanical work performed.

$\Sigma^n{}_0$ the symbol of a sum consisting of n parts.

Then, as the total work of the forces is equal to that of the stresses :

$$2W = \Sigma^n{}_0\ S_x\ \Delta l_x = \Sigma^r_0\ Fd \quad (3)$$

Here : $S_x = \sigma_1 F_1 + \sigma_2 F_2 + \sigma_3 F_3 + \ldots . \sigma_r F_r$ (4)

and $\Delta l_x = S_x m_x$ (5)

Then (1) will be :

$$2W = \Sigma^n{}_0\ (\sigma_1 F_1 + \sigma_2 F_2 + \ldots . \sigma_r F_r)^2 m_x = \Sigma^r{}_0 F d \quad (3a)$$

This work, resolved into its parts, is as follows :

$$\left.\begin{array}{l}\Sigma^{n}_{0}\,\sigma_1 F_1\,(\sigma_1 F_1+\sigma_2 F_2\\ \quad +\ldots,\sigma_r F_r)\,m_x\\ +\Sigma^{n}_{0}\sigma_2 F_2\,(\sigma_1 F_1+\sigma_2 F_2\\ \quad +\ldots\sigma_r F_r)\,m_x\\ +\ \ldots\ldots\ldots\ldots\\ +\Sigma^{n}_{0}\sigma_r F_r\,(\sigma_1 F_1+\sigma_2 F_2\\ \quad +\ldots\sigma_r F_r)\,m_x\end{array}\right\}=\left\{\begin{array}{l}+F_1 d_1\\ \\ +F_2 d_2\\ +\ \ldots\\ \\ +F_r d_r\end{array}\right\}\quad(3b)$$

The first line of this expression represents that part of the work which is done by F_1, the second line that done by F_2, etc., and each line is an equation by itself, *i.e.*, generally:

$$\Sigma^{n}_{0}\sigma_u F_u\,(\sigma_1 F_1+\sigma_2 F_2+\ldots+\sigma_u F_u+\ldots\ldots+\sigma_r F_r)m_x=F_u d_u\quad(3c)$$

Dividing by F_u we have:

$$d_u=\Sigma^{n}_{0}\,\sigma_u\,(\sigma_1 F_1+\sigma_2 F_2+\ldots\ldots\sigma_u F_u+\sigma_r F_r)\,m_x\quad(6)$$

As all the quantities in the sum are known, the movement d_u, *i.e.*, the deflection under F_u can be calculated.

(To be concluded.)

A CATALOGUE OF CONCRETE AND STEEL.

That well-known firm of engineers and contractors, Messrs. D. G. Somerville and Co., 72, Victoria Street, S.W., specialists in reinforced concrete and steel construction, have just issued a revised edition of their catalogue. In former editions this catalogue was always worthy of note as a useful little treatise on both commercial and scientific aspects of those two very important branches of modern construction—reinforced concrete and steelwork. But this present edition is a great improvement on former editions, and now serves as a really valuable aid-book on the subjects with which it deals; indeed, it may be considered in part a text-book worthy of study by all those interested in the science of building construction.

In the early days of reinforced concrete construction in this country, when contractors who specialised in reinforced concrete were few and far between, Messrs. D. G. Somerville and Co. recognised the possibilities of the new system, which were bound to cause its progress by leaps and bounds, and the demand that would ensue for reliable contractors who not only knew how to execute such work, but possessed the staff and organisation to execute it satisfactorily. Reinforced concrete is a delicate system that requires careful and honest workmanship, and is hazardous if done in a slipshod fashion. Experienced superintendents and workmen, selected for their care and attention, and properly trained, are vitally necessary to secure efficient work, and therefore specialist contractors for the work are necessary. Messrs. Somerville, recognising the great opening, spared no pains to fit themselves for it, and their enterprise has been rewarded by the placing in their hands of many large contracts for execution. Their record has been a uniformly successful one, and everywhere their work has given satisfaction. They are prepared to guarantee all the work they undertake, whether on their own systems or on other well-known ones. This is a safeguard that will appeal to architects and engineers, and any business man.

This catalogue, the result of extensive experience, and issued by a firm of such eminence, is worthy of careful perusal, and we note that Messrs. Somerville understand what was expected of them in a catalogue, and have provided some useful memoranda and sober trustworthy information that should appeal to all those who have used or are contemplating using reinforced concrete in their structures.

In this new edition, they have made no attempt to show a complete collection of works executed by the firm in reinforced concrete, or in constructional steel, but endeavour rather to indicate by means of photographs and sketches of actual works the application of these methods of construction. The various notes and tables are intended for reference in ordinary cases only, but at the same time it is hoped they may also serve to explain the principles underlying the designing of such structures to those who have not already taken up the subject. Though this firm have their own systems of fire and sound-resisting flooring, they are prepared to execute work on almost any system on the market, and they place their staff of engineers and their advice and services at the entire disposal of clients.

After some preliminary remarks on reinforced concrete construction, the catalogue proceeds to give practical notes and data on the subject, followed by information on the materials and a standard specification for reinforced concrete; then a brief account of an approximate method of calculating dimensions of beams and columns; next a chapter on the practical applications, describing in turn, with diagrams, foundations, retaining walls, wharves and piers, culverts and sewers, factory buildings and water towers, bridges, and fireproof flooring and floors on various systems, followed by illustrations of a few of the works executed by Messrs. Somerville, from which we borrow the view reproduced on this page, showing one of the latest works carried out by the firm, namely, Messrs. McVitie and Price's Biscuit Works at the Franco-British Exhibition, to be afterwards re-erected at Willesden, entirely constructed of reinforced concrete. (Mr. T. Duncan Rhind, A.R.I.B.A., was the architect.)

The constructional steelwork section of the catalogue provides notes on the properties of rolled steel joists and steel stanchions, tables of strengths, practical notes on girders and stanchions, standard roof principals and steel roofing, followed by tables of weights of materials and loads, weights of flat and round steel, and angles and tees, tables of proportions and strengths of cast-iron columns, and finally views of steelwork in buildings supplied and erected by the firm.

We strongly advise all readers particularly interested in the subject of steel and reinforced concrete to write for a copy for reference. The address of Messrs. D. G. Somerville and Co. is 72, Victoria Street, Westminster, S.W.

McVITIE & PRICE'S BAKERY AT THE FRANCO-BRITISH EXHIBITION. ERECTED BY D. G SOMERVILLE AND CO.

THE ARMOURED TUBULAR FLOOR.

An interesting and useful illustrated pamphlet descriptive of the Armoured Tubular Flooring Company's system of constructing reinforced concrete floors, which were some time ago described in detail in these columns, has just been issued, from which we reproduce four views. The pamphlet contains a general description of this ingenious and economical system of fireproof flooring, together with notes on the theory of the subject and typical calculations. The pamphlet is very well got up, and will repay perusal. Fig. 1 shows an "Armoured Tubular" floor in course of construction at the Albert Foundry, Belfast, for Messrs. Jas. Mackie and Sons, Ltd., in which the spans between the main steel beams are 20ft. The floor, it will be clearly seen from this view, consists of webs or beams of reinforced concrete, with hollow concrete tubes placed between, and a top layer of concrete applied over all.

Fig. 2 shows the underside of such a floor—in this particular case a hospital ward of 30ft. span—from which it will be seen the soffit of the armoured tubular floor between walls or main beams is level. The hollow spaces render the floor sound-resisting. It is obvious that the system does not require centering, and permits of extremely rapid construction, besides having other advantages. Fig. 3 shows the manufacture of reinforced concrete webs on benches. The fact that they are made in a factory ensures proper and exact placing of the reinforcement, and regularity and uniformity of production. The fresh webs remain on the forming boards for three days, and are then turned up and left in the yard to harden. Fig. 4 shows a patent hand-press for the manufacture of the tubes, in which four tubes are turned out at a time.

The address of the Armoured Tubular Flooring Co., Ltd., is 53, Victoria Street, Westminster, S.W.

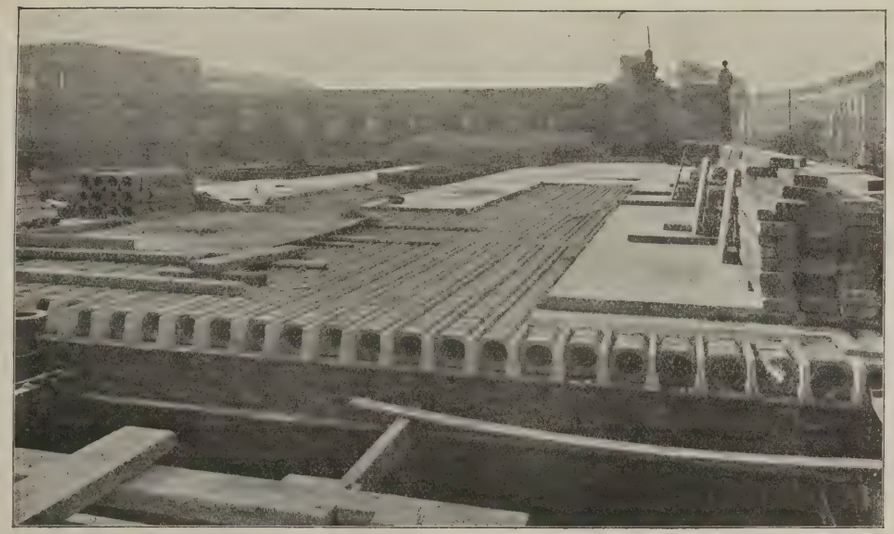

FIG. 1.—ALBERT FOUNDRY, BELFAST (MESSRS. JAS. MACKIE & SONS, LTD.). SPANS 20 FEET.

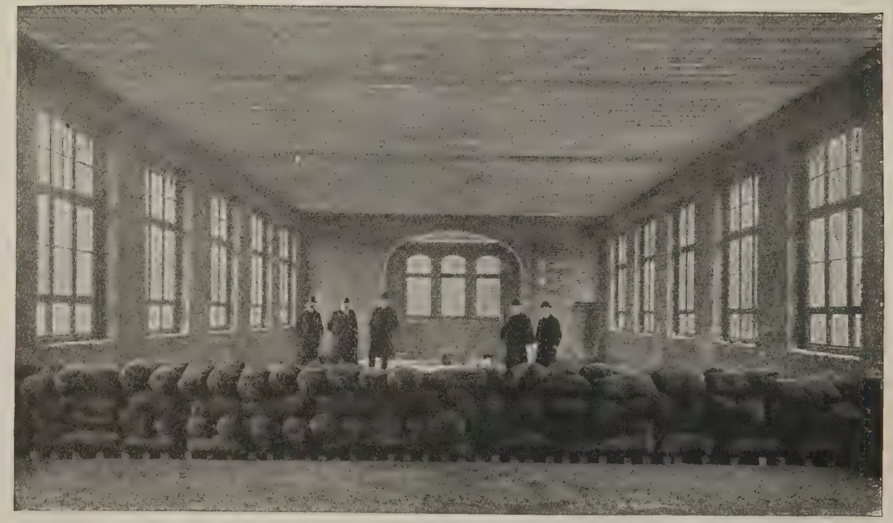

FIG. 2.—VIEW SHOWING SOFFIT OF A 30-FT. SPAN BEFORE PLASTERING. ALSO SHOWING CONTRACTOR'S LOADING TEST. HOSPITAL WARD.

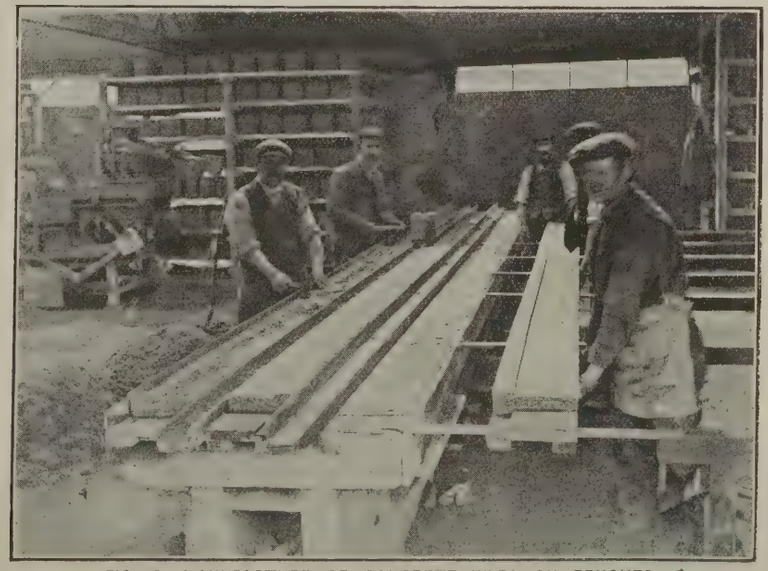

FIG. 3.—MANUFACTURE OF CONCRETE WEBS ON BENCHES.
By this method the vital point of reinforced concrete construction—the proper and exact placing of the reinforcement—is fully ensured. The fresh webs remain on the forming boards for three days, and are then turned up and left in the yard to set.

FIG. 4.—PATENT TUBE PRESS.
For the manufacture of the tubes, hand presses turning out four tubes at a time are used.

ARMOURED TUBULAR FLOORING IN COURSE OF CONSTRUCTION AND MANUFACTURE.

BUILDING MONOLITHIC CONCRETE WALLS.

At the Franco-British Exhibition at Shepherd's Bush, W., the Monocrete Construction Company, of Cheltenham, have a stand where they are showing their new "Monocrete" machines in operation, and examples of their work. Monolithic solid and hollow concrete walls for houses, built *in situ* between a wooden shuttering, have been constructed for very many years, and a long time ago considerable attention was attracted to the subject by the efforts of a number of inventors who brought out appliances in the shape of adjustable forms for raising concrete walls rapidly and economically. These pioneers mostly had only a short period of prosperity, as their claims were extravagant, and in those early days concrete was not so well understood as to-day. Many cottages, and even mansions, have been built with monolithic concrete walls, however, and the experience of years has proved them to be healthy and advantageous, although naturally there have been examples to show that no system of construction is proof against the failures due to ignorance, carelessness, and scamping. The moulding of walls *in situ* has not made much progress since the days of these early inventors, and of late years we have seen arise a plentiful crop of advocates for the hollow concrete block. Concrete blocks can be economically and satisfactorily manufactured, and can be used with advantage and economy, though they are also very open to failure through ignorance and scamping. A hollow concrete block needs to be properly made with plenty of cement, well cured, and bedded in plenty of good mortar. So many failures have resulted that some persons have condemned them entirely, which is foolish, and asserted that hollow block walls never resisted heat, cold and damp, and therefore were not healthful. It has been proposed as an alternative to employ thin solid blocks and erect two skins with a hollow space between, tying them together by the same means as a cavity brick wall.

Mr. R. Bowen, of Cheltenham, however, comes forward with another solution. He reverts to the solid or hollow monolithic concrete moulded *in situ*, but his invention is considerably different in principle and detail from the early method of construction. The old-time method has been to leave the shuttering in position till the concrete had set, which entailed loss of time, besides considerable expense. Mr. Bowen moulds his concrete fairly dry, so that he can remove the mould immediately it has been well tamped therein. Then, again, metal-faced moulds were seldom or never used, and the shuttering, when arranged to be moved along or up the wall, as in some designs, required adjustment at each operation to ensure its being level and upright. The "Monocrete" machine is a light metal-lined mould, which can be moved along the wall and up the wall without requiring levelling either horizontally or vertically. This is obtained by making the machine overlap the work at the side and below, and sliding it on bearers in the wall. As soon as the mould has been filled with concrete, it is unclamped, the sides swinging open on hinges, and moved along two, three, or more feet, and the concrete again filled in, thus uniting with the previous section of the work, which is still soft. The machine travels in this way round the walls of a building upon the completed wall below, the top of the wall being always left level by striking off the concrete from the top of the mould, so that the wall rises in exactly even regular layers. These layers unite thoroughly well with each other horizontally, but, if desired, special means may be taken to ensure it.

Figs. 1 and 2 clearly show the "Monocrete" wall-building machine. It consists of two sides of wood lined with a non-corroding alloy of magnesium and aluminium, which is very light, and an end of the same material, the latter having a roller wheel attached to run along the wall below, and pivots upon which the sides are hinged. Fig. 2 shows clearly how the mould grips the completed portion below and at the other end. The sides are held together by a top clamp, and also by flat metal blades laid on the wall below and passing through a long slot in the sides of the mould, and holed at the ends to receive wedges for tightening, as seen in the view. Metal core-boxes are placed in the mould if desired to form cavities, or places for resting ends of joists. Vertical reinforcements may be easily passed up through it, and horizontal reinforcement can be laid horizontal between the layers, or even closer, by passing it through holes in the metal end. The concrete having been well rammed in, the top clamp and the side wedges are removed, the blade furthest from the metal end is pulled out, and the sides are swung out on the hinges and slid along on the blade left in position until the required position for the next length is arrived at.

The work is easily, rapidly, and efficiently done by unskilled labour. The metal faces to the moulds leave a smooth face on the concrete; but, as this is still soft when the moulds is taken away, it is an easy matter to strike imitation joints upon it, scabble its face like hammer dressing, dash pebbles on it to make rough cast, or otherwise ornament it. Walls are smooth enough to leave without internal plastering, though we should advise it to prevent condensation of moisture. The same principle of mould construction has been applied to the building of columns, corners, kerb, and channel combined, either *in situ* or on the bench.

FIG. 1. VIEW OF MONOCRETE MACHINE IN POSITION, SHOWING FIRST LENGTH OF WORK.

FIG. 2. MONOCRETE MACHINE IN POSITION, MAKING SUCCEEDING LENGTHS OF WORK.

"Monocrete" wall-building machines are made of various standard sizes, called "outfits," which cost but a small outlay, and which, while a complete plant in themselves, will work with larger outfits, so that a constructor's plant can be augmented gradually if so desired. It is asserted that with a small staff of four ordinary labourers and one man with a general knowledge of building, an amount equal to at least 2,500 to 3,500 bricks in contents can be made and laid daily as finished work, at a labour cost of not exceeding 10s. per 1,000 bricks capacity, and in many cases considerably less.

The "Monocrete" system of building monolithic concrete walls *in situ* seems to have a great future before it, and certainly has been well thought out, and the plant carefully and skilfully devised.

Trade and Craft.

Illuminating the White City.

Everyone who has visited the Franco-British Exhibition is agreed on the point that the illumination of the various buildings, which are outlined with hundreds of thousands of incandescent electric lamps, is one of the most striking and attractive features of the White City. The scene every evening, when the current is switched on, is one of extreme beauty; there is nothing glaring or garish to offend the most sensitive taste. On the contrary, the strikingly artistic affect has been produced by exercising the greatest care, not only in the positions, but in the quality of the lamps used. All the lamps used by the authorities for outlining the buildings are the well-known "Royal Ediswan," made by the original patentees of the electric lamp, who hold the honour of appointment to H.M. the King, and H.R.H. the Prince of Wales. This firm are showing, in the Machinery Hall, specimens of "Royal Ediswan" lamps in the various processes of manufacture, as well as numerous other electric appliances of interest.

Federation News.

Northern Counties Federation of Building Trade Employers.

William H. Hope, Solicitor, Secretary, Post Office Chambers, Norfolk Street, Sunderland.

A special general meeting of all the members of the Federation was held at Sunderland on Tuesday, the 29th September, 1908. The principal business of the meeting was with respect to the conditions of tendering and contracting for work for public authorities, and particularly for the Durham County Council. The two important question at issue are the principle of settlement of disputes by an independent arbitrator, and that the bill of quantities shall be part of the contract. Representations have been made to the Council, but without avail so far as these two matters are concerned. The president (Councillor Stephen Easten, Newcastle-on-Tyne) pointed out that these conditions, which are embodied in the National Form of Contract, have been accepted by the Royal Institute of British Architects, and various Government departments who carry out public works. Public authorities have usually, agreements drawn up by their own architects, which are entirely in the interests of the authorities, and being drawn by their officials, have in view the protection of the officials themselves. The conditions thus make the builder responsible for any errors or omissions that may occur in the bills of quantities, or otherwise. Although the architect is the servant of the council, he is the arbitrator of any disputes that may arise, either between the council and the builder or the architect himself and the builder. This Federation has obtained concessions on other matters from the Council, but these two very important grievances remain unremedied. Some little time back, after a great deal of correspondence between this Federation and the Education Committee, a meeting was arranged between the Committee and a deputation consisting of himself and the Secretary. They were at the Council's offices at the appointed time, but owing to the Council not having finished the transaction of its usual business, they had to wait in the corridor for half an hour, and a further half an hour in the waiting-room, when as there appeared to be no probability of the meeting taking place, they left in disgust. Had the Operatives' Unions or Societies been treated in such a manner there would have been trouble. In fact, they might do worse than follow the Operatives' tactics in a similar manner. They must adopt some measures to put a stop to, or, at least, get their grievances modified, and this meeting had been called to arrive at a satisfactory solution. There were several courses open: to approach the Board of Education and the Local Government Board and lay the facts before them, or to refuse to tender until their grievances were modified. After a great deal of discussion upon the matter, on the proposition of Mr. A. Ross (South Shields), seconded by Mr. H. McNaughton (Middlesbrough), it was unanimously resolved:—"That a deputation be appointed from this Federation to meet the Education Buildings Committee at their next meeting, to go fully into the two important questions at issue, and that failing to secure a modification of the conditions of contracting, that the members of this Federation pledge themselves to refuse to tender, and that the deputation consist of Messrs. Stephen Easten, Geo. Gradon, J. Davison, J. W. White, A. Ross, A. T. Weir, and the Secretary, with power to appoint a substitute if necessary, and that all members of the Buildings Committee be written fully explaining the grievances of this Federation."

Bankruptcies.

SHEPPARD, JOHN THOMAS, builder, Mill Street, Evesham, and Cornwall villa, Honeybourne (trading as J. T. Sheppard and Co.). Gross liabilities, £1,824 19s. 6d.; £1,637 15s. expected to rank; assets £939 2s. 11d.

HART, CHARLES, builder, residing and carrying on business at Laurel Cottage, Hemyock, Devon. Gross liabilities £92 18s. 10d.; assets, £20.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Oct. 7. WALLS (Shetland).—Construction of a steamboat pier at Walls, Shetland. Plans and specification may be inspected at, and schedules of quantities obtained from Sievwright and MacGregor, solicitors, Lerwick; Scottish office, engineering dept., 122, George Street, Edinburgh; and from G. Woulfe Brenan, M.I.C.E., Albany Street, Oban.

Oct. 7. BURTON-UPON-TRENT.—Erection of a new Police Station, Superintendent's House and Court House, in the borough, for the Corporation. Drawings, specifications, and conditions of contract may be seen, and bill of quantities and form of tender obtained at the office of Henry Beck, architect, 10, High Street, Burton-upon-Trent, on and after Sept. 23, upon the deposit of a cheque or post-office order for £3 3s. Tenders, endorsed "New Police Station, etc.," must be delivered, not later than 10 a.m. on October 7, to T. N. Whitehead, town clerk, town hall, Burton-upon-Trent. Fair wages clause.

Oct. 7. BRIDGEND.—Erection of blocks of conveniences in Airing Court and additions, etc., to laundry at Angelton Asylum, Bridgend. Repairs to attendants' messroom, etc., at Parc Gwyllt Asylum for the committee of visitors of the Glamorgan county asylum. Specifications, bills of quantities, and forms of tender may be obtained from the clerk, and the drawings may be seen either at the office of the architect, R. S. Griffiths, Tonypandy, Rhondda Valley, or at Angelton asylum, Bridgend. Separate sealed tenders, marked outside "Tender for Laundry and Conveniences, Angelton," or "Repairs to Floors, Parc Gwylt," must be received not later than noon on October 7th, to W. E. Allen, clerk to the committee of visitors, Glamorgan county council offices, Westgate Street, Cardiff.

Oct. 7. SOUTH DUBLIN.—Erection of 206 labourers' cottages, under 46 contracts for the R.D.C. The works are to be completed under a penalty for delay. Plans, specifications and schedules may be inspected, and tender forms obtained at the offices of the rural district council; tenders are to be lodged not later than 11 a.m. on October 7, with T. J. Byrne, clerk of the council, 1, James Street, Dublin. Tenders must contain the names and addresses of two solvent persons willing to join the person tendering in a bond for the execution of the work of an amount equal to that of the tender.

Oct. 8. METHLICK.—Carpenter, slater, plaster, plumber, heating, and painter and glazier works, for the trustees of the Beaton Public Hall. Plans and specifications may be seen with and schedule of quantities obtained from James Cobban, architect, Haddo House, who will receive tenders up to 10 o'clock on Oct. 8.

Oct. 8. BALLYMACREEVAN.—Repairs to chimneys of labourers' cottages at Ballymacreevan, for the Antrim R.D.C., in accordance with specification, to be seen on application to James Frazer, or A. J. Caldwell, Crumlin, and at office of J. Clark, clerk of council, Antrim.

Oct. 9. ELGIN.—Mason, carpenter, plumber, slater, plaster, and painter works of additions and alterations on property at Moss Street, Elgin. Plans and specifications may be seen with John Wittet, architect, Elgin.

Oct. 9. BRIGH, STEWARTSTOWN (Ireland).—Erection of a new Presbyterian Church, at Brigh, Stewartstown. Schedule of quantities and conditions of tender can be obtained from Acheson Ferguson, 2, Wellington Place, on a deposit of two guineas. Plans and specification may be seen at the office of Young and Mackenzie. Sealed and endorsed tenders, addressed to the Rev. William M'Elhatton, B.A., to be lodged by October 9th with Young and Mackenzie, Scottish Provident Buildings, Belfast.

Oct. 10. ILSINGTON (Devon).—Restoration of the tower and other repairs to St. Michael's Church, Ilsington, Devon, for the vicar and churchwardens. Persons desirous of tendering may see the specifications at the offices of the architects. Tenders to be delivered by Oct. 10 to E. H. Harbottle and Son, architects, County Chambers, Exeter.

Oct. 10. STRAWBERRY BEDS (Co. Dublin).—Erection of a national schoolhouse at Lower Road, Strawberry Beds, Co. Dublin. Plans and specification can be seen with S. Fennelly, P.P., Parochial House, Blanchardstown.

Oct. 10. BANGOR-ISYCOED.—Restoration of the upper portion of Bangor Isycoed church tower, specifications of which may be had on application to W. J. Mackenzie, Oak Lodge, Cross Lanes, near Wrexham. Tenders must be sent, endorsed "Tender for Church Tower," by Oct. 10.

Oct. 10. CLOS-DU-VALLE, GUERNSEY.—Construction of a new school for the joint education committee. Contractors on receiving plans and specifications must deposit £5 at the education office. Applications for forms of tender should be made to the president of the states committee, education office.

Oct. 10. STANTON-UNDER-BARDON (Leics.).—Erection of a new elementary school, at Stanton-under-Bardon, to accommodate 150 children, together with out-offices, drainage, and other works connected therewith, for the education committee of the Leicestershire county council. Conditions of contract, quantities and forms of tender may be obtained from the architects, Harding and Topott, Hotel Street, Leicester, on payment of two guineas. Sealed tenders, upon the forms supplied, to be sent in the envelopes provided, to the county education office, 33, Bowling Green Street, Leicester, by noon on October 10th. The successful contractor must find two sureties in a sum amounting to 20 per cent. of the total amount of the contract.

Oct. 10. LOW WESTWOOD, EBCHESTER.—Erection of a house at Low Westwood, Ebchester. Separate tenders may be given for each class of work, viz., mason, plastering, joinering, plating, etc.; or for the whole of the work. Plans and specifications can be seen at R. Fenwick's, Earsdon House, Ebchester, co. Durham, to whom all tenders must be sent by Oct. 10.

Oct. 10. WESTMORLAND.—Extensions and other work to Warcop Hall, Westmorland, for J. A. Wild. Plans and specifications can be seen and bills of quantities obtained upon application at the architect's office, up till Oct. 10, upon which day sealed and endorsed tenders are to be sent to Stephen Shaw, F.R.I.B.A., architect, Kendal.

Oct. 10. DERBY.—Extension of the Barlborough Council School and master's house, for the education committee. Persons desirous of tendering may see drawings, specification, agreement, etc., at the office of the architect to the committee, between 10 a.m. and 4 p.m., Saturdays 10 a.m. to noon. Bill of quantities, specification, conditions of contract, and form of tender can be obtained at the architect's office upon payment of one guinea. Sealed tenders in envelopes provided endorsed "Tender for Alterations, Barlborough Council School," must be delivered not later than 5 p.m. on Oct. 10 to George H. Widdows, A.R.I.B.A., architect to the committee, county education office, St. Mary's Gate, Derby. Two approved securities as security for the due and proper performance of the contract will be required.

Oct. 12. SEDGEFIELD.—Alterations and additions to two houses in Front Street, Sedgefield. Plans may be seen and specifications obtained between 5.15 and 6.15, Saturday afternoon after 1.30 p.m., on depsiting cheque for 10s. Sealed tenders, endorsed "Builder," to be delivered before noon on Oct. 12, to T. W. Thubron, Front Street, Sedgefield.

Oct. 12. HULL.—Erection of an infants' school, Craven Street, for the education committee of the corporation. Drawings and specifications may be seen with Joseph H. Hirst, city architect town Tall, Hull, and quantities obtained upon a deposit of two guineas. Remittances to be made payable to the city treasurer. Tenders, sealed and endorsed "Tender for School, Craven Street," to be addressed to the secretary of education, and delivered at the education offices, Hull, by 10 a.m. on Oct. 12.

Oct. 13. WITHINGTON.—Plastering the walls of the cottage hospital at the Withington workhouse, for the guardians of the poor. Specifications may may be obtained at the offices of Charles Clegg and Son, architects, 31, Spring Gardens, Manchester, upon payment of £1 1s. Sealed tenders must be delivered by 5 p.m. on Oct. 13, to David S. Bloomfield, clerk to the guardians, union offices, All Saints', Manchester,

Oct. 14. The whole to be delivered in barges alongside the pier at Sheerness at contractor's cost. The council will unload and cart and pay pier dues. Samples of the materials must be sent to the surveyor to the council, Thos. F. Berry. Sealed tenders (on forms which may be obtained from the clerk), stating price per ton (or per yard in the case of hoggin), endorsed outside "Tender for Road Material," must be delivered before noon on Oct. 12, to Vincent H. Stallon, clerk of the council, Council Offices, Trinity Road, Sheerness. Materials to be delivered on the order of the surveyor before Nov. 30.

Oct. 12. NEW WORTLEY.—Paving about 650 square yards of roadway in the cemetery, for the burial board. Specifications can be seen, and all particulars obtained, from H. Williams, clerk and superintendent, any day during office hours. Tenders, endorsed paving, and addressed to the chairman of the board, should be sent by Oct. 12.

Oct. 12. STREATHAM.—Making-up and paving that part of Chillerton Road, Streatham, which lies between Rectory Lane and the south side of Crowborough Road, for the Corporation of Wandsworth. Specification and drawings may be seen, and forms of tender obtained, at the borough engineer and surveyor's office, new streets department, 56, East Hill, Wandsworth, S.W., between 10 and 4 (Saturdays 10 and 12). Tenders, enclosed in separately sealed envelopes and endorsed "Tender for Paving Chillerton Road," must be delivered to Henry George Hills, town clerk, council house, Wandsworth, S.W., and may be placed by the person tendering in the box provided for the purpose not later than 4 p.m. on Oct. 12. If required, the contractor must provide two sureties for the due execution of the contract.

Oct. 13. FLIXTON.—Kerbing, channelling, flagging, and macadamising Alderley Road, off Flixton Road, for the Barton-upon-Irwell Rural District Council. Plans, sections, and specifications may be seen, and forms of tender and quantities obtained upon deposit of £2, from the surveyor to the council, A. H. Mountain, A.M.I.C.E., union offices, Patricroft. Tenders to be addressed not later than Oct. 13, endorsed "Tender for Street Works," to J. W. Whitworth, clerk, union offices, Patricroft.

Oct. 13. LEEDS.—Excavating, concreting, and paving about four miles of double tramway track in the urban districts of Horsforth, Rawdon, Yeadon, and Guiseley, for the tramways committee. Specification and forms of tender may be obtained on application at the tramways office after Oct. 7. Tenders to be delivered by 10 a.m. on Oct. 13, to J. B. Hamilton, general manager, City Square, Leeds.

Oct. 13. LEE.—Kerbing, channelling, and metalling roadways, and paving footpaths with artificial stone (in separate contracts), Kellerton Road, Lee, for the Corporation of Lewisham. Plans and specifications may be seen, and forms of tender obtained at the Town Hall, Catford (surveyor's department). Copies of the specification may be had on payment of five shillings in each case, which will not be returned. Tenders, on forms issued, enclosed in an envelope, sealed and endorsed "Tender for Paving Kellerton Road," must be delivered by 4 p.m., on Oct. 13, at the town hall, and placed in the box provided for the purpose. The contractor must employ local labour as far as practicable. Fair wages clause.

Oct. 13. MERTON.—Making up the undermentioned private streets in the urban district of Merton, viz., Adela Avenue, Douglas Avenue, Estella Avenue, Seaforth Avenue. Plans, sections and specifications may be seen and forms of tender obtained (on payment of £2) on application to G. Jerram, surveyor, council offices, Merton. Sealed tenders, endorsed "Tender for Private Street Works," must be delivered by 4 p.m. on Oct. 13, to C. J. Mountfield, clerk, district council offices, Kingston Road, Merton, Surrey.

Oct. 14. CARDIFF.—Supplying and fixing kerbing on portions of the Aberdare and Hirwain, Aberdare and Navigation, Neath and Pontwalby, Bridgend and Port Talbot, Bridgend and Llantrisant, Cardiff and Pontypridd, Cowbridge and Llantrisant, and Neath and Llansamlet main roads for the Glamorgan County Council. Contractors must produce evidence of being insured against liability for accidents to workmen. Copies of the specification and quantities may be obtained at the offices of the clerk, and at the county surveyor's office, town hall, Bridgend. Sealed tenders for the whole or sections of the work on bill of quantities supplied to be delivered together with the names and addresses of two substantial sureties, by October 14, marked outside "Tender for Kerbing," to T. Mansel Franklen, clerk of the county council, Glamorgan county council offices, Westgate Street, Cardiff. Fair wages clause.

Oct 14. TWICKENHAM.—Supplying brown Kentish pit flints, for the U.D.C. Form of tender and specification may be obtained on application to Fred W. Pearce, F.S.I., surveyor to the council, town hall, Twickenham. Sealed tenders, endorsed "Tender for Pit Flints," are to be delivered by hand or registered post, by Oct. 14, to H. Jason Saunders, clerk to the council, town hall, Twickenham.

Oct. 16. PRESTON.—Levelling, paving, etc., and making good Thorn Street, from Ribbleton Lane to No. 39, for the Corporation. Plan, section, and specification may be seen and schedule of quantities and form of tender obtained at the office of the borough surveyor, Town Hall, Preston, to whom sealed tenders, endorsed "Tender for Paving, etc.," must be delivered by noon on Oct. 16. Fair wages clause.

Oct. 20. BARNET.—Supplying materials and labour in making-up and formation of Clarendon and Malden Roads, Boreham Wood, for the R.D.C. Drawings and specifications may be seen at the office of the council's surveyor, T. England, "Fernlea," Furze Hill Road, Boreham Wood, where forms of tender may be obtained. The contractor will be required to give security, in accodance with the Public Health Act, 1875, for the due performance of contract. Local labour where possible must be employed. Sealed tenders, endorsed "Street Works," to be delivered on or before October 20th, to G. D. Byfield, solicitor, clerk to the council, 12, High Street, Barnet, Herts.

Oct. 21. KINGSTON-ON-THAMES.—Supplying about 5,000 tons of Guernsey, quenast, or other granite, for the Corporation, suitable for road-making, to be broken to pass through a ring 1½-in. internal diameter. Deliveries spread over a period of twelve months. Tenders to be on forms obtainable of the borough surveyor, R. Hampton Clucas, at the municipal offices, where samples must be left. Sealed tenders, endorsed "Granite," to be delivered by Oct. 21, to Harold A. Winser, town clerk, municipal offices, Kingston-upon-Thames.

MISCELLANEOUS.

Oct. 12. EAST PRESTON.—Steam rolling roads throughout the district, for the R.D.C. Tenders, stating weight of roller, and other particulars, with price per day inclusive, to be sent to the chairman of the rural district council, board-room, East Preston, by Oct. 12. The person whose tender is acceptel must enter into a contract to supply the roller upon receiving six days' notice under a penalty.

Oct. 14. KIRKCUDBRIGHT.—Construction of 150 lineal yds. or thereby of a concrete quay wall fronting the river Dee, with excavations, road-making, filling up the existing dock, and other attendant works, for the town council. Drawings may be seen at the office of J. and H. V. Eglesham, C.E., 24, Wellington Square, Ayr, from whom copies of the specification, lithograph plans of site, etc., schedules of quantities, and forms of tender may be obtained on payment of £2 2s. Tenders, on the form supplied, and marked "Tender for Harbour Works," to be delivered by 4 p.m. on Oct. 14, to John Gibson, town clerk, town clerk's office, Kirkcudbright.

Oct. 15. ROCHDALE.—Erection of an overhead bare copper cable at the workhouse, for the guardians. Specifications, etc., to be obtained of the union clerk. Tenders, sealed and endorsed "Cable," to be delivered by Oct. 15, to R. A. Leach, union clerk, union offices, Rochdale.

Appointments Wanted.

The charge for Advertisements under this heading is 1s. 6d. per insertion for the first four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two. Advertisements can be received up to 10 o'clock on Tuesday morning.

Advertisements received on Tuesday morning will be found on page xxviii.

ADVERTISER requires situation in south of England; experienced in all branches of land and building surveying, levelling, quantities, dilapidations, 5 years with Urban Council, near London; good draughtsman; qualified P.A.S.I.—Box 4538, BUILDERS' JOURNAL Office.

ARCHITECT'S Assistant (22½) desires engagement; six years' experience; good knowledge of domestic and city warehouse work; 1st class honours construction. Student R.I.B.A.—A. T., 2, Avenue Road, Forest Gate, E. 4568

ARCHITECT (practising) is willing to assist others in all kinds of architectural and office work, at own office, or elsewhere.—S., 143, Cannon Street, E.C. 4528

ARCHITECT and surveyor's assistant (22), wide experience, working drawings, details, and full sizes; specifications, measuring and supervising, etc.; excellent refs.; salary 30s.; trial willingly. —Box 4596, BUILDERS' JOURNAL Office.

ARCHITECT and surveyor's assistant desires engagement, 15 years' experience; good draughtsman, colourist, etc., working drawings, details, specifications, surveying, levelling, and general routine; moderate salary; excellent references.—A. R., 1, Ivy Villas, Cheam, Surrey. 4557

ARCHITECT'S Assistant, fully qualified, wide experience; excellent testimonials, desires London engagement, whole or part time. — Box 4601, BUILDERS' JOURNAL Office.

ARCHITECT and Surveyor's Assistant (24); 9 years' London exp.; working drawings, specifications, superintendence, quantities and land surveying; prizeman, architectural drawing, and quantities; medallist building construction; excellent testimonials; mod. sal.—W., 20, Holmewood Road, Streatham Hill, S.W. 4592

ARCHITECT'S and Surveyor's Assistant (21) requires engagement with good architect, 3½ years' student in architect. construction and kindred subjects, land surveying and levelling. Board of Education qualifications; prelim. R.I.B.A., refs.—Apply Box 4572, BUILDERS' JOURNAL Office.

A Practical estimator will be pleased to price builder's quantities or give estimates from plans and specifications for tendering, quickly by post. Send for lowest terms.—Estimator, c/o Mr. Moth, Baddow Road, Chelmsford. 4535

ARCHITECT and Surveyor's Assistant (21), good draughtsman, details, perspectives, surveying, levelling, etc. Prize-winner, first class advanced building construction, and architecture certificates —S. K., Prob.R.I.B.A., first-class refs.; moderate salary.—Box 4578, BUILDERS' JOURNAL Office.

ARCHITECT and surveyor's managing assistant, A.R.I.B.A., desires engagement at home or abroad. Twenty years' experience. Good testimonials and references.—C. A. C. Springfield, 31a, Leyland Road, Lee, S.E. 4542

ARCHITECT'S Assistant, well recommended, 14 years' good all-round experience; practical, working and detail drawings, quantities, specifications, supervision; salary 2½ guineas. — Box 4536, BUILDERS' JOURNAL Office.

ARCHITECT and surveyor's junr. assistant; 4½ years' experience; working and detail drawings; levelling, perspectives, specifications; assist quantities; excellent testimonials; moderate salary.—Box 4546, BUILDERS' JOURNAL Office.

ARCHITECT'S assistant, experienced in working drawings, details, surveys, etc.; first-class references; specimens of work; orders taken for water colours, perspectives, deed plans for conveyancing, drawings, designs, etc.—Aubrey Pritchard, Bryndenden, Rhyl, N.W. 4549

ARCHITECT and surveyor's assistant, 10 years' good all-round experience, north and south; take charge; capable draughtsman; working drawings, details, quantities; moderate salary.—W. T., 40, Whitstable Road, Canterbury. 4561

ARCHITECT'S Assistant (23), over 7 years' London and Provincial experience; excellent references. Inter.R.I.B.A. Exam.—H. J. Wilson, 17, Clifton Road, Crouch End, N. 4612

ARCHITECT'S and Surveyor's Assistant desires change; 6 years' varied general experience; assist quantities, good refs.—Box 4617, BUILDERS' JOURNAL Office.

ARCHITECT'S Assistant, 7 years' experience, desires engagement in London or provinces; designs, working drawings, details, etc.; excellent references; moderate salary. — Apply Box 4548, BUILDERS' JOURNAL Office.

ARCHITECT'S son, 10 years' office experience, wishes to take up agency or post as representative in Lancashire, or North of England, to well-known firm in any special line of Building trade. —Apply Box 4585, BUILDERS' JOURNAL Office.

BUILDER'S clerk, used to double entry, dissecting time sheets, etc.; good general experience; draughtsman; within 60 miles radius.—Henry, 4, Plimsoll Road, Finsbury Park, N. 4493

BUILDER, with nine years' experience in first-class house-building and general repairs, desires appointment; fair draughtsman, well up all trades, tradesman; moderate salary; highest references. —Box 4507, BUILDERS' JOURNAL Office.

BUILDER'S Assistant (23), disengaged; construction, surveying, mensuration; fair knowledge quantities and levelling; also costs, accounts, wages, etc.; good draughtsman; supervise jobs and assist estimating.—Box 4523, BUILDERS' JOURNAL Office.

BUILDER'S Clerk and assistant (20), seeks engagement, general experience, book-keeping, time sheets, plans, etc.; good references, and moderate wages.—Apply Box 4555, BUILDERS' JOURNAL Office.

BUILDER'S Assistant desires situation. Sixteen years' experience in office routine, estimating, measuring, accounts, etc. Also experienced in outdoor management. Moderate salary.—W. P., 65, Leicester Road, East Finchley. 4569

BUILDER'S and decorator's clerk seeks situation, well up in all trades; ten years' experience; age 26; Midlands preferred; wages moderate.—Apply Box 4599, BUILDERS' JOURNAL Office.

BUILDER'S assistant desires change, 29, abstainer, experienced, quantities, plans, surveying, estimating, book-keeping, shorthand, typewriting, measuring, variation accounts, supervise jobs; excellent references; moderate salary.—Box 4604, BUILDERS' JOURNAL Office.

BUILDER'S Clerk (24), seeks situation; 7½ years' London experience. P.C. jobbing, wages; schedule work and assist estimates; good refs.—B., 11, Belitha Villas, Barnsbury, N. 4608

CLERK of Works, 16 years' experience, supervision and management of important buildings in London and country, well up in details, special knowledge of ecclesiastical buildings. — T. B., Box 4603, BUILDERS' JOURNAL Office.

CARPENTER and joiner, work wanted, piecework; any quantity; labour only; good references.—W., 14, Gorrings Park Avenue, Mitcham, Surrey. 4526

CARPENTER and joiner wants work; bench fixing, alteration, or jobbing. Could take charge of general work. Life abstainer. Good references. Age 32. Very energetic.—Pearson, 53, Hartham Road, Isleworth, W. 4471

CONTRACTS.—Estimator, measurer, etc. (London and country experience), requires position. Successful in tendering. Can guarantee brisk business. Make most of measured accounts, and practically and efficiently help with management. Country preferred. **Small salary.** — Estimator, Durston House, **The Grove, Deal.** 4564

ENGINEER wants post, London or Provinces; 12 years' experience, calculations, quantities, designs, detail drawings, bridges, structural steelwork, prepared, reinforced concrete.—Box 4579, BUILDERS' JOURNAL Office.

ESTIMATOR and building surveyor, Q.S.A., desires re-engagement with builder, architect, or surveyor; permanent or temporary; estimates, quantities, measurements, variations and accounts.—A 768, Fulham Road, London, S.W. 4501

ESTATE Clerk of Works, all-round town and country experience; surveying, plans, quantities, etc.; considered good manager of men; character will bear strictest investigation.—Apply Box 4566, BUILDERS' JOURNAL Office.

GENERAL Foreman, just completed West-end job; experienced and capable.—Reply J. L., 20, Wellington Avenue, Lower Edmonton. 4618

GENERAL Foreman, long and varied experience in town; thoroughly practical; good at reinforced concrete work; trade joiner; moderate wages; good references.—50, Peel Road, Wembley. 4565

IMPROVER, surveyor's or builder's office (21), technical student, four years' practical knowledge, supervise, neat draughtsman; abstainer; good references.—Marfleet, Totland Bay, I.W. 4581

IMPROVER, brass-finisher, requires situation; 3 years' previous experience with well-known London firm; excellent references. Apply Box 4550 BUILDERS' JOURNAL Office.

JUNIOR Assistant desires situation, home or abroad; good practical knowledge of construction and details; competent draughtsman and colourist, working drawings, measuring and supervising, surveying and levelling; moderate salary.—Box 4613, BUILDERS' JOURNAL Office.

JUNIOR Assistant (22), student R.I.B.A., practical building construction, experience, details, working drawings, neat draughtsman, surveying, assist quantities; three building certificates; prizeman, good references; specimens; salary moderate.—Box 4593, BUILDERS' JOURNAL Office.

LATE Pupil (22), four years' experience, requires berth as surveyor's or architect's assistant, drawing, surveying, levelling, qualified Stage III., Building Construction and Architecture.—J. W. D., Laurelwood, Hare Lane, Godalming. 4582

MACHINIST (joiner) requires re-engagement; good spindle hand, used to first-class work; 10 years last place; good references.—H. Cruse, Boxford, Newbury, Berks. 4537

MANAGER of masonry works or general foreman, well up in management of men and machinery, London and country experience; practical in all trades. — Thomas, 38, Napier Road, Tottenham. 4602

PLUMBER (26), abstainer, well up in all sanitary or lead-laying; will do piecework; town or country. Can do zinc and hot water.—W. E. B., School House, Muriel Street, Barnsbury, N. 4615

PLUMBER, experienced (registered), **gas and hot water fitter, new jobbing, sanitary work,** good lead layer, desires permanency; excellent references; town or country. — Box 4556, BUILDERS' JOURNAL Office.

QUANTITY Surveyor, Member Q.S.A., 32, eight years' practical building experience, eight years' office practice, desires post as senior or managing assistant.—Box 4610, BUILDERS' JOURNAL Office.

SHOP or General Foreman, long West-end experience, used to alterations and repairs; understands stairs; used to good jobbing work. Address A., c/o Mr. Seymour, 14, Allsop Place, Regent's Park, N.W. 4586

STUDENT R.I.B.A., 23, well trained man, desires situation as assistant; 1½ guineas. — Box 4607, BUILDERS' JOURNAL Office.

TO Estate Owners.—Builder (38), varied experience, desires position as agent or clerk of works, surveys, plans, quantities, setting out, accounts and supervision; country preferred.—Box 4591, BUILDERS' JOURNAL Office.

Property & Land Sales

By EDWIN FOX AND BOUSFIELD.

At the Auction Mart.

On Wednesday, October 21, at Two o'clock.

To be let on Building Leases, in Four Lots.

CITY OF LONDON (on the verge of).—FREEHOLD BUILDING SITES advantageously situate, being Nos. 1 and 3 and 2 to 18 (even) Clifton Street, Nos. 31 to 37 (odd) Sun Street, Nos. 32 to 38 (even) Earl Street, and Brown's Buildings, with access also to Appold Street, close to Finsbury Square and the railway termini at Liverpool Street and Broad Street The property possesses the extensive fontages of 175 ft. to Clifton Street, 82 ft. to Sun Street, and 72 ft. to Earl Street, and covers the total area of about 30,000 superficial ft., and is admirably adapted, both from the extent and position, for the erection of manufacturing warehouses or other commercial premises suited to the various trades carried on in the locality.

Building leases for 99 years from December 25, 1908, will be granted at rents to be determined by competition, subject to an allowance of one year's peppercorn.

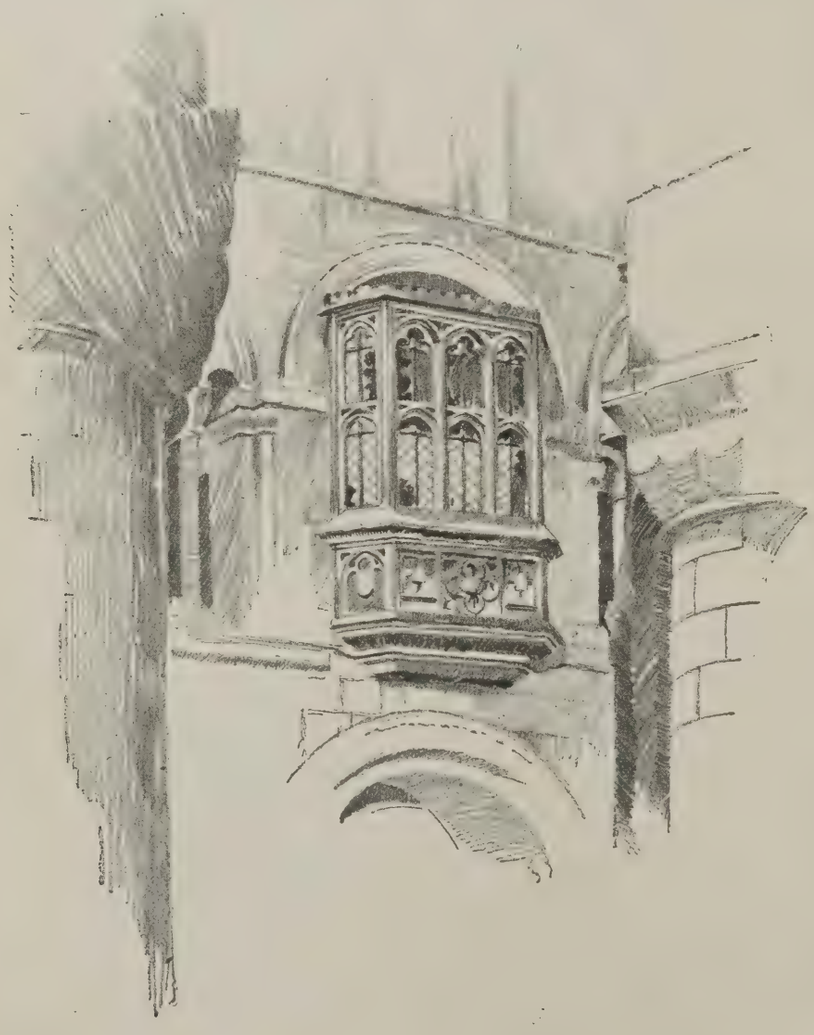
Mr. Cave and Unemployment.

In the present sorry state of the Architectural Profession it is some satisfaction to find the President of the Architectural Association addressing that body on the evils of unemployment, and particularly on the aspects of it that have been apparent to the officials of the Association during the past session. It is a somewhat disheartening tale—an unemployment register that grew to alarming proportions during the early summer, resignations due to inability to pay subscriptions, and arrears in subscriptions that have had to be met by much patience, forbearance and sympathy. And lastly a slightly diminished membership, due, we are glad to say, to a decrease in the number of new members; for if the Profession is overcrowded, and this is admitted on all hands, it were idle, nay, criminal, to rejoice over an increase in the number of men enrolled in it. Indeed Mr. Cave's address was graver, and, if we may apply the word, more statesmanlike, in tone than any of the Presidential addresses we remember for many years past. Of yore students and young architects were exhorted to enthusiasm on all and every occasion; it was as the blessed word Mesopotamia in the Presidential vocabulary. Now we have a President who recognises that enthusiasm must already exist among young architects at the present day, and that they require no exhortations on the subject; that the young men, to-day, are sufficiently acquainted with the hard and bitter side of life to realise their responsibilities without a periodical call to order. And in tackling a question which must ever be present to their minds, and in adding words of sympathyand understanding, Mr. Cave has confirmed the wisdom of his re-election to the Presidential chair. For if a little help is worth a deal of pity, an ounce of sympathy is worth, now-a-days, a ton of preaching. In the present ing words of sympathy and understanding, ment are needed to keep up a man's ideals, and to stimulate his energy to greater efforts. At the same time we could have wished that Mr. Cave had grasped this nettle more firmly, and discussed the causes of its growth a little more closely. We are not persuaded that these causes are beyond the power of architects to remedy if not wholly to prevent. Architects get but a very small proportion of the nation's building activities under their control; in a time of depression, such as we are now experiencing, they get practically none at all. Our object therefore should be to so rehabilitate the profession in the public mind that it obtains its proper share of the nation's work; and that can only be effected by Architects banding themselves together, so that by virtue of their strength they will be enabled, not to supplicate, but to demand a due recognition for their art. To deserve that recognition and to keep it they must ensure that each man who joins them is properly and adequately trained, and those who cannot boast that qualification must be excluded from the ranks. It is idle to argue that what other nations have done and are doing cannot be done here. It can be done; only the personal susceptibilities of the few are upraised against the welfare of the many, who must finally prevail. If the leaders will not lead let us see to it that the movement comes from the ranks, and that soon. There is no time like the present.

King's Lynn and Its Council.

We referred in a previous issue to the action of the King's Lynn Town Council in passing the plans of four cottages which show an open space at the rear of the buildings, smaller than the area prescribed by the by-laws. Now we are no friends of that rigid Government code of building rules that so many provincial authorities have adopted to their subsequent sorrow; we have criticised "full many a time and oft" its sins of omission and commission; its foolish prohibition of methods of building perfectly suitable to rural districts; its inapplicability to both urban and rural needs. But if there is one by-law that should be enforced without compunction, both in town and country, it is the one that regulates the amount of open space around a dwelling. Half the by-laws in the code would be unnecessary if there was one transcendent by-law stipulating that no dwelling-house shall be hereafter erected on less than a prescribed minimum area of ground, and that such dwelling-house shall not cover more than a certain proportion of the said minimum area. Possibly when the taxation of land values has passed into law, it might be possible to give effect to such a regulation; but until then it is an imperative duty for authorities to permit no deviation from the salutary rules that are already in existence. The restricted area makes the potential slum: it is the battle ground where national welfare wages war with private greed. It is impossible to sympathise with the Lynn Councillors; they passed these plans by 12 votes to 5, against the advice of their Surveyor and Medical-officer, after an unseemly squabble. It cannot be urged, therefore, that they were passed in ignorance. Now a town meeting has been held, and a resolution unanimously passed protesting against their conduct, and a copy of this resolution is to be sent to the Town Clerk and to every member of the Town Council. But why not have sent a copy to the Local Government Board? it would be much more effectual. If the outside world scents the acrid vapour of jobbery in this business, the Lynn Town Council has only itself to blame.



Primitive Pontefract.

Pontefract is itself again. The judgment of Philip drunk has been reversed by Philip sober. The Corporation, it appears, had appointed one of their members to be the architect for a new elementary school, "upon resigning his seat." The quoted phrase we take as we find it in the local press, and precisely what it means is with us a matter of pure conjecture. But, whatever the arrangement may have been, it has fallen through, and honour is vindicated. The Corporation has been prevailed upon to rescind its resolution, and to invite competitive designs for the school. Pontefract's noble victory over itself was not achieved without a struggle. That there was much preliminary heart-searching and soul-wrestling may be inferred from this discreet but pregnant passage from a local newspaper: "A heated discussion ensued, into which personalities were freely and liberally introduced." It may have been an equally exuberant but more kindly disposed manifestation of this same free and liberal spirit that led the Corporation to the verge of what a censorious and a cynical world might be tempted to regard as jobbery. We prefer to regard the incident as the innocent tactical error of a plain and primitive people, who, like the genial philanderer in "Beauty and the Barge," meant "no harm, only affability." And if, as may be inferred, the architect has lost both his seat on the Council and his hold on the job, one is rather disposed to pity his plight. He could not well have both, but, assuming that, as we are glad to believe, he was entirely free from guile with respect to

this serio-comic episode, it seems rather hard that he should have neither the one nor the other, and thus be made the sole victim of the Corporation's little mistake. Perhaps he will try his luck in the competition; for which, it is to be hoped, a competent assessor may be appointed, if only for the better avoidance of the "frequent and free" personalities to which the primitive people of Pontefract seem painfully prone.

American Architects Anathematised.

It would be interesting to know exactly what is the matter with M. Borglum, the Belgian sculptor, who has been engaged on the decoration of the Episcopal Cathedral of New York. His own view is that American architecture has disagreed with him. At any rate, he has delivered himself—or, at least, is reported to have done so—of a rather atrabilious criticism of American architects. He says that they "have cribbed every form and scroll they build," and that "they wander annually to Europe to gather ideas to restock their idealess plants at home." He adds that "they are laymen, untouched by dreams of ideals, who peddle cotton, religion, and æsthetics." Perhaps these observations have lost or gained something in the process of translation into the American language. As they stand, they will hardly conduce to M. Borglum's popularity among Americans, who are notoriously supersensitive to candid criticism. Let us hasten to add that we by no means share M. Borglum's views. Much of the architecture of America is really noble in the *ensemble*, whether or not the details were "cribbed." As to American architects flocking to Europe—"annually" or otherwise—to study architecture and "gather ideas," where else would M. Borglum have them go—to the boundless prairie? And would he deny them also the inestimable (but apparently somewhat risky) privilege of importing Belgian sculptors? We suppose, however, that his opinions on architecture ought to be worth having, or it would not have been thought worth while to publish them in a New York journal, and reproduce them in a London daily newspaper. There is the more reason why he should have expressed them temperately.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Oct, 31	BURY. NEW SECONDARY SCHOOL for the Education Committee. Premiums of £50, £25, and £10. Particulars and site plan from Robert Wilkinson, Director of Education, 8, Bank Street, Bury. Deposit £1 1s.
Oct. 31	*ROMFORD. COUNTY HIGH SCHOOL FOR GIRLS. Applications for Conditions to D. T. Williams, 71, South Street, Romford, Essex, to be made by or before August 24th, accompanied by deposit of five guineas, of which sum five pounds will be returned on receipt of bona fide design.
Nov. 1	CARDIFF. COUNTY HALL AND OFFICES. Particulars and site plan from T. Mansel Franklen, Clerk, Glamorgan County Council Offices, Cardiff.
Nov. 14	WHITEHAVEN. NEW PUBLIC ELEMENTARY SCHOOL, Irish Street, for 700 children. Limited to Cumberland architects. Plan of site and conditions from W. D. P. Field, Secretary, Education Committee, Town Hall, Whitehaven. No statement as to premiums or deposit.
Dec. 14	BLACKPOOL. CENTRAL PUBLIC LIBRARY.—Premiums of £52 10s., £31 10s. and £21. Particulars and site plan from T. Loftos. Town Clerk, Town Hall, Blackpool. Deposit £1 1s.
Dec. 19	WHITTINGHAM. ANNEXE TO ASYLUM FOR PAUPER LUNATICS, for the Lancashire Asylums Board. Limited to Architects who are in practice and are ratepayers in the County of Lancashire. The new building is to accommodate 700 Inmates. Premiums of £100, £50, and £25. Particulars and plan of site from Leonard Colman, Law Clerk to Committee of Visitors, 8, Lune Street Preston. Deposit £5 5s.
No Date.	CORNWALL COUNTY OFFICES.—Designs and *Estimates* invited. Premiums of £50. £20 and £10. Premium for successful design to merge in Commission. Particulars from C. L. Cowlard, Clerk to County Council. Bodmin. Deposit. £1 1s.

* *This competition has been unfavourably reported upon by a Correspondent.*

Congregational Church House, Manchester.—The award of Mr. Paul Ogden, F.R.I.B.A., the assessor in the competition for the above building, has just been announced. The design placed first was prepared by Messrs. Bradshaw and Gass, of Bolton. The design by Messrs. J. Gibbons and Son was placed second, and that by Messrs. J. and J. Swarbrick third. Many designs were submitted, and they were all of a very meritorious character. The designs were exhibited in the rooms of the Manchester Society of Architects, 16, St. Mary's Parsonage, Manchester, from Tuesday, October 6th, to Tuesday, October 13th, 1908.

New Schools for Rotherham.—The award of Mr. E. R. Robson, of London, the assessor of the competitive designs for the Upper Standard School proposed to be erected on the South Grove site, Rotherham, has been delivered. He placed No. 2 plan first in the competition, and the No. 3 plan second. These plans are the designs (No. 2) of Mr. David B. Jenkinson, and (No. 3) of Mr. James Totty, both of Rotherham. The premiums for the first is £50, and for the second £20. The school is estimated to cost £12,000.

Whittingham Asylum Annexe.—This new competition is announced. We note the absurd sum of £5 5s. deposit required for the conditions.

Other Competitions.—We refer to the "Daily Mail" Ideal Homes, and the Swansea Cottage Homes' Site Competitions elsewhere.

THE ARCHITECTURAL ASSOCIATION.

The President on Architectural Depression.

Mr. Walter Cave delivered his Presidential address to the Association on Friday last. After thanking the members for the honour of his re-election, he:

Thanked the retiring members of the Council, Messrs. R. S. Balfour, E. Guy Dawber and J. S. Gibson for their services, and extended a cordial welcome to their successors, Messrs. G. Gilbert Scott, F. Winton Newman and Percy May:—

Expressed the sincere thanks of the Association to the officers, Mr. Henry Tanner and Sir A. Brumwell Thomas, Vice-Presidents, Mr. C. Wontner Smith and Mr. Maurice E. Webb, Hon. Secretaries, and Mr. Henry T. Hare, Hon. Treasurer; and also to the permanent staff, particularly Mr. Driver, the Secretary, who "has worked as hard and as successfully as ever. . . . . Everyone who has been intimately connected with the Architectural Association knows that it is very largely due to Mr. Driver's tact and ability that we are in the position we occupy to-day":—

Alluded to the

Extinction of the Building Debt

on their premises by a final payment of £628 6s. 5d., completing the total of £10,326 and leaving a credit balance of £280; and also to the necessity for extensions, more space being required for the increasing library, extra accommodation for the staff and a hall for the meetings, suggesting the inauguration of an Extension Fund, to which sums could be allotted from time to time as the resources of the Association:—

Mentioned that the

Membership is Now 1,727

as against 1,754 last year, a decrease due to a diminution in the number of new members:—

Referred to the generous donation of a sum of money, by an anonymous benefactor, to form

A New Travelling Scholarship

in connection with the British School at Rome; also to the Henry Saxon Snell Scholarship of £50, and hoped that the subject set this year—"A Convalescent Home for Children"—would produce a good competition; also to the essay prize, for which the subject set is "The Development of Brickwork":—

Tendered the thanks of the Association to the Editors of The Association Journal, Messrs. Edwin Gunn, G. L. Elkington, J. Alan Slater and Percy May, and to the retiring Editor, Mr. Baxter Greig:—

Acknowledged the indebtedness of the Association to the various Architects and Builders who have permitted the members to make visits to their buildings, and alluded, with satisfaction, to the large attendance at these visits and to their value to the student.

The President then dwelt at some length on the

Energy and Progress

of the Association, and to the numerous outlets into which that energy was directed, mentioning the Discussion Section the Camera and Sketching Club, the Musical Society and the success of its play, and the Athletic Club, which has now over 160 members, and which embodies Cricket, Rifle, Swimming, Rugby Football, Hockey, Association Football and Rowing Sections—only the last two needing more support. Mr. Cave, in reiterating his firm belief in athletics, in the training and self-denial necessary for an athlete, and the value of the special qualities thus developed in general life, suggested the formation of a Golf Section for those members whose cricketing and football days are over.

He went on to refer to those hopeful signs of energy and progress in the Association, but pointed out the immense amount of organisation required to keep all this going, and to the necessity for all even the most junior members taking their share in the work. "I think that with an Association like ours the sooner the younger members are placed in a position of responsibility the better for them and for the Society. In order to forward these ends, the Council, after careful consideration, has adopted certain regulations affecting its elections and the posts of its officers, whereby

Promotion Will be More Rapid

and the younger members will have greater opportunities of coming to the front. Progress should be the password, not only of the Council, but of all the minor branches of the Association."

The A.A. Schools.

The President then spoke of the schools and of the success which had attended the policy initiated last year, of placing both the day and evening schools under one head master, Mr. Maule, who had been ably seconded by Mr. Varndell and all the assistant masters. They had to regret the retirement of two of the teachers, Mr. Banister F. Fletcher and Mr. T. O. Foster, whom he thanked on behalf of the Association, for their excellent work. He alluded to the loss of Mr. H. H. Stannus, "who for many years was a lecturer of exceptional merit, and a very true and kind friend to many of our members, and one who always took the greatest interest in our Schools."

A reference to the Life Class, started during the session, and to the value of figure-drawing for architects, the human figure being the standard for proportion for all architecture, brought the President to a consideration of the alterations "in connection with the Intermediate Examination of the Royal Institute of British Architects. Probably those whom this examination mostly affects have noted these changes. But I cannot help feeling that to the profession at large the omission of the development of the Greek and Roman Orders as a subject comes somewhat as a shock. Other subjects omitted include the characteristic Gothic mouldings in England, Classic ornament, and the outlines of Mediaeval and Renaissance Architecture in Europe. It is true that two subjects are added to take the place of part of what is omitted, but to my thinking the omission of the study of the Orders seems a mistake, and especially so in these days, when the revival of the Renaissance is playing such an important part in the architecture of our time."

Mr. Cave then referred at considerable length to the prevailing

Depression in Architecture.

which remarks we give in full:—

"The architectural profession has lately been passing through one of its periodical times of depression, and although there are some signs of improvement, the outlook is still very serious. It would be useless to enter into the causes for this, as I believe they are beyond our control, and it would not profit us in any way, but it may be of interest to note its effect on our Association.

"As I stated at the beginning of my paper, our numbers have suffered a slight decrease, but this is a small matter as compared with the number of resignations due to inability to pay our subscription. I can assure you that the Council has listened with the most sincere regret to letters from members who have been thrown out of work. In all cases where it has been possible, the greatest leniency has been exercised, and whenever applied for, extension of time has been gladly given. The Council has also decided to give more nominations in connection with the Architects' Benevolent Fund on account of the recent donations made by the Musical Society, and thus in some measure help our more unfortunate brothers. There is another way in which this general depression has affected the Association, and that is in the Register of Assistants kept in the office. This list of the unemployed reached alarming proportions during the early summer, and it is a fact well known to the Secretary, that members still keep their names on the list though they may have obtained a temporary berth. This is obviously unfair, and will in future be very strictly watched and guarded against as far as possible. Then again, it is open to very serious question if, in view of our large membership, *non*-members should be allowed to avail themselves of the Register of Assistants. It is not so much on account of possibly crowding out the members themselves, though this is of some importance, but on account of the fact that in very few cases have these non-members received as good an architectural training as we ourselves provide. It is quite true that all our members have not been through our Schools, but the number of those who have is increasing rapidly, and the demand in many of the best offices in London and the provinces for assistants trained in our Schools is, I believe, greater than the supply. I think that it would be to our advantage as an Association and to the profession at large if our Register was kept for our own members. This, I know, will be called 'Protection,' but the article is good, and I do not see why we should not get a full return for it.

"There is another point in connection with the present depression in our profession, which I should like to touch on, namely, the establishment of Architectural Schools mainly supported by the public rates. During a crisis like the present one, the fact that the architectural profession is overcrowded must become more and more apparent, and the facilities afforded by these rate-aided schools induces many parents to see a simple solution of the education question by making their boys architects if they show the smallest liking for drawing, and the result is that in, say, 80 cases out of every 100 these boys reach manhood only to find themselves draughtsmen with intermittent employment, when they might be in a position of earning a living by the exercise of some trade.

"I do not deny the advantages which are gained by the education of the artistic sense, which may awaken the desire for beauty, which, after all, is a natural instinct. This, in the abstract, is one thing, but the indiscriminate training of practitioners, with the rare chance of benefiting some individuals, at the expense of others, is a policy which is open to very serious objection.

"These remarks apply equally well to our Schools, but with a difference. I think with us it will be conceded that the education offered; and the methods

adopted, are of a higher quality than in the schools I have mentioned. The result is that a better class of student is attracted.

"We have spent many years in establishing our system. We have a large majority of the profession behind us, and devote our whole energies to turning out men who will be a credit to us. And lastly, we do not hesitate (and I speak with personal experience) to point out very clearly to parents the inadvisability of their sons adopting our profession whenever circumstances clearly indicate that to be the wisest course, and before it is too late to start in some other direction.

"The qualifications which are necessary for the making of an architect have been the subject of several presidential addresses from this chair, and I do not intend to go over the same ground. But there are several points in connection with modern architectural practice which I think might be noticed in connection with these remarks. For instance, the purely business side of our work is daily becoming more and more important. The increasing restrictions of the Building Acts, not only in the towns but in the country, necessitates a study of the legal aspects of problems which are already sufficiently difficult. It has frequently occurred to me that there is room for a special consulting branch in our profession, which would deal entirely with these legal points connected with all questions of light, air, party walls, Building Acts, &c., and even questions of sanitation. These consultants might have the same training as the ordinary architects, and special classes might be arranged accordingly in our Schools, so that they could enter into the architectural aspects of the case, at the same time as they specialised on these particular points.

"Another point in connection with modern practice is the increasing competition of the big furnishing companies, who not only undertake to supply everything necessary to the furnishing of a building, but actually to provide the building itself. I suppose we have all suffered under this innovation, and it is very difficult to see any remedy. There is no doubt that the public are saved, or think they are being saved, a great deal of trouble if the whole transaction is carried out by one firm, and it is unfortunately true that the public have little confidence in architects' estimates. This I believe to be one of the main causes of the growth of these firms, who are gradually usurping the functions of the architect. There is also the question of capital which can be spent in the form of advertisement, and in submitting unsolicited designs, which would be not only derogatory, but impossible to the members of our profession. The remedy for this can only be looked for in steady, conscientious work, and in paying particular attention to estimating, and endeavouring in every way to restore the confidence of the public. It is a fact that the public are beginning to take more interest in architecture, and critical articles are appearing form time to time in the Press which show that there is a section of the people with a desire for beauty, which, as I have said before, is a natural instinct, and only requires proper training to make itself felt.

"The development of the critical faculty is important, not only to the public and the Press, but also to architects themselves, and I venture to say that the real power of criticism is extremely rare."

The President concluded his address with some remarks on the value of

Accurate Observation.

and memory sketches. These are good materials with which to feed the critical faculties, but we have to find out for ourselves what is good and what is beautiful.

"Youth is the age for receiving and retaining impressions.

"Last year I reminded you of your glorious heritage in the past.

"Throughout the length and breadth of England were still to be seen buildings full of the quiet beauty of the country side, full of the history of bygone generations, and full of the true spirit of romance. These things can only be appreciated by those who approach them with reverence, and with love for the labours of those hands long since at rest. So I would say to the student, try and realise the beauties of your own country before the calls of work make it too difficult. Journey, if need be, on foot, and drink in the spirit of romance before it is too late, and so when the opportunity comes you may be able to lift your art above the rush and tumult of to-day."

THE ARCHITECTURAL PROFESSION OF TO-DAY.—V.

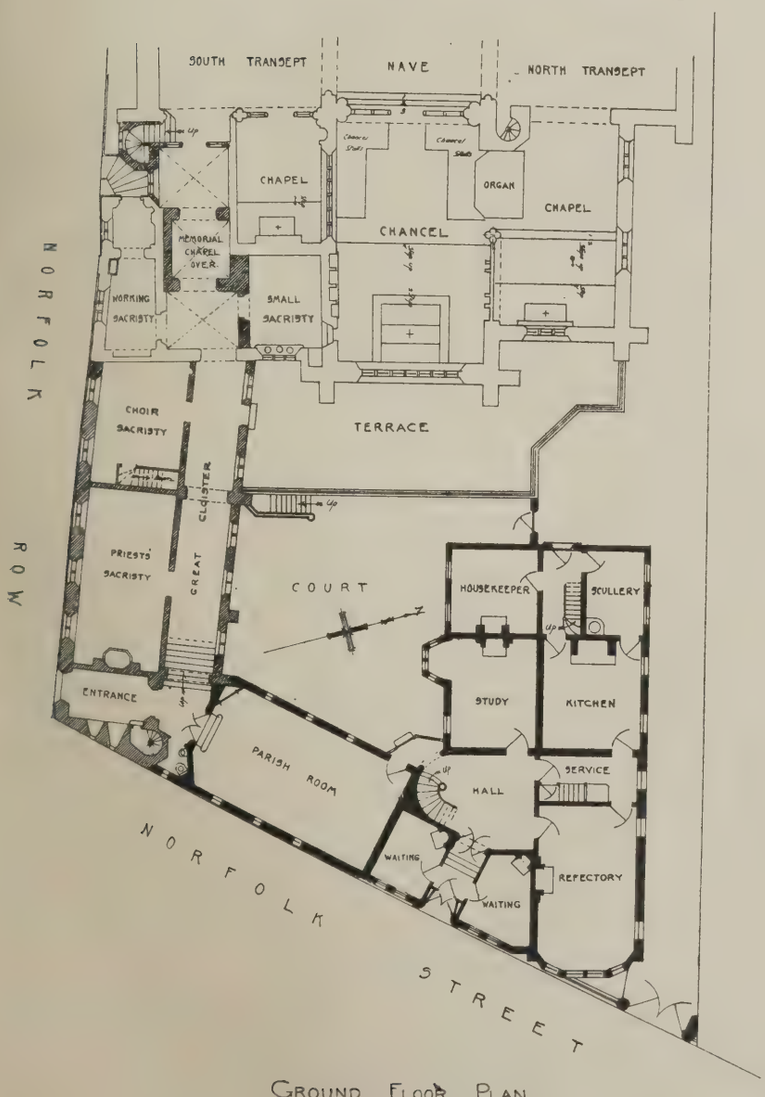
"There is but one way of making great evils small; that of looking them straight in the face."—Democritus.

We earnestly advise members of the architectural profession to act upon the excellent precept contained in the above quotation from the writings of the ancient Greek philosopher. In our view their profession is being constantly lowered in public estimation by the unprofessional conduct (and disloyalty to the collective interests of practitioners), evinced from time to time by architects whose methods of obtaining work seem to proceed almost entirely from a far too zealous and exclusive concern for their individual interests. All who have, even to a limited extent, the interests of their profession at heart should, therefore, carefully consider and endeavour to realise the probable effect on the minds of the public of the various nefarious practices to which we are about to call attention, and to look these, or other, evils which beset the profession, "straight in the face" with the object of devising some means of removing them forthwith—root and branch.

Although we confess we think it extremely unlikely that any remedial measure, short of the adoption of Registration, will bring about the desired effect, yet we should be glad to receive a practical suggestion relative to the possible formation of a Board of Control, specially appointed with the view of preventing unscrupulous architects from disgracing their profession and themselves by such disloyal actions as (1) working for less than the authorised scale of charges, (2) taking part in competitions, either in the capacity of assessor or competitor, of which the conditions are not of a nature to commend themselves to the majority of the members of the architectural profession, (3) degrading the profession and reducing it in public estimation to the level of a trade by endeavouring to attract the attention of the public to themselves and their buildings through the medium of huge notice boards and other methods of advertisement.

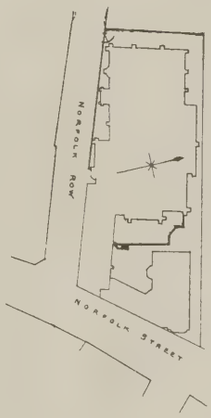
With regard to (1) there is, unfortunately, every reason to believe that, owing to the general dearth of work and the increasing stress of competition among the members of a terribly overcrowded profession, the practice of *underselling* is becoming all too prevalent among the architects of to-day. Nor is this reprehensible method of securing work by any means confined to the less known members of the architectural fraternity. Even architects who belong to that particularly select and august coterie from which competition assessors are usually selected have been sometimes known to undersell each other when application has been made to them by promotors of competitions to state the fee they require for acting in the judicial capacity to which we refer. Now the authorised scale of charges for assessing competitive designs is explicitly stated in the regulations governing the conduct of architectural competitions drawn up and issued by the R.I.B.A. But notwithstanding this fact some architects who, presumably, are held in sufficient general esteem to be regarded in the light of suitable candidates for an appointment of this kind (which ought to be looked upon as one of an extremely honourable nature), are capable of acting in the manner we have indicated.

As to (2), the evil-doers are found both among competitors and assessors. Members of the architectural profession have frequently been warned, years ago through the medium of the Competition Reform Society, and, in more recent times, by the veto of the R.I.B.A., not to take part in certain competitions in which the conditions were not regarded as satisfactory. In the case of the Competition Reform Society, we believe we are stating a fact in saying that in each instance in which the veto was applied, the members of that society loyally and honourably adhered to the views of its governing body. But the Royal Institute of British Architects, on at least one memorable occasion, has covered itself with ridicule by its clumsy, although well-meaning, efforts to "boycott" competitions of a particularly unsatisfactory character. In the case, for example, of a recent competition which was thus vetoed by the R.I.B.A., not only was a very prominent architect—despite the prohibition of the leading architectural society—induced by the promoters to act in the capacity of assessor, but among the competitors were to be found the names of several well-known members of the very institute whose council had been endeavouring to render the competition abortive. In view of this somewhat unfortunate contretemps it would be as unwise to dilate at any length on the extent of the *esprit de corps* observable among members of the profession as it would be useless, in the future, to insist with any large amount of superfluous fervour upon the much vaunted influence of the Royal Institute of British Architects. We are aware that the assessor to whom we refer is not a member of the R.I.B.A., but, in our judgment, disloyalty to the profession at large is a far more heinous offence than any refusal to be bound by the most uncertain, vacillating, and often unfair and erratic action of the Council of the Institute on questions affecting the conduct of architectural competitions. Surely the success met with by the comparatively small body of ardent reformers which constituted the membership of the Competition Reform Society affords sufficient proof of what



can be accomplished by an organisation of architects who, having previously agreed upon a definite policy of reform, are sufficiently tenacious of their purpose to ensure the realisation of their aspirations? We believe the primary pledge required from every member of the Competition Reform Society was one to the effect that he would undertake to abstain from taking part in any competition in which the promoters had not definitely stated their intention of appointing a suitable assessor. Thus, some years ago, by means of this useful Society, the interests of competing architects were well safeguarded and zealously maintained. But since the work of the Society has been carried on by the Competitions Committee of the R.I.B.A., the result has been anything but satisfactory. Strangely enough, only to-day, whilst the above lines were being penned, we received a letter of complaint from a Fellow of the R.I.B.A. to the effect that another Fellow of that body had recently taken part in a competition for which no official assessor had been appointed! With this recent example of the extreme usefulness of the R.I.B.A., perhaps one of the many ardent supporters of its well-known *laisser-faire* policy will tell us why a small and little-known organisation of architects, in which the names of "eminent" practitioners were conspicuous by their absence, could, years ago, successfully effect what the Royal Institute of British Architects is unable to accomplish to-day?

Whilst, perhaps, there is, to a limited extent, *something* to be said in favour of (3) inasmuch as it might possibly serve to create some sort of public interest in the architect and his work if the name of the designer of a building were, unobtrusively, inscribed upon some portion of the structure, yet the direct advertising suggested by the methods employed by those architects who are accustomed to fix huge notice boards, embellished with their names, qualifications (if any), and addresses (all of which may, however, be thus conspicuously presented with the truly laudible object of directing the public to the terrestial abode of the untrained architectural "genius") similar in character to those displayed by enterprising house-agents and tradesmen does not serve to make it easier for the man in the street to understand where the "art" of the architect ends and the commercial instinct of the tradesman begins.



Owing largely to the overcrowded condition of the architectural profession there has been, for many years past, what may perhaps justly be described as a fierce scramble for work in which, not unnaturally, those architects in whom the com-

(See Centre Plate.)

mercial instinct is present in a highly developed form have often succeeded, whilst their artistically (or morally) far more deserving brethren have failed. The formation of a thoroughly representative Board of Control to the authority of which all practising architects throughout the Kingdom should be subject would probably result in bringing about an improvement in some present-day methods of conducting an architect's practice. All duly authenticated complaints of unprofessional conduct could be inquired into and adjudicated upon by this Board of Control by which could also compile and issue to members of the profession a scale of fees governing the professional practice and charges of architects. Attention has so frequently been drawn to the careless manner in which, to the serious detriment of the profession at large, the scale of charges issued by the R.I.B.A. has been drafted, that it seems hopeless to expect that anything will be done by that body to remedy the evil. With clause (1) of this precious document staring him in the face how can an architect, by any strength of the imagination, reasonably contend that the drawings and documents relating to a building he has designed remain his own property on the completion of the work? Yet such is still the contention of many members of the profession, although those architects who have been present in courts of law when this ancient controversial question has been the subject of acrimonious dispute are better informed.

Our Plate.

The illustrations show the St. Marie's parish room and clergy house, erected at the corner of Norfolk Row and Norfolk Street, Sheffield. They form the completion of the grouping of buildings embodied in a general scheme laid down in the early forties, when St. Marie's Church was erected in the hey-day of the Gothic revival, the late Matthew Ellison Hadfield and his partner, John Gray Weightman, collaborating in the design. The church itself, with nave 100 feet by 25 feet, chancel 40 feet by 24 feet, width across aisles of 60 feet, and transept 83 feet internally, and tower and spire some 200 feet high, was opened in 1850. The Munster Memorial Chapel, Sacristies, and building at the junction of Norfolk Row and Norfolk Street, were designed by Mr. C. Hadfield, later, in 1876-8, while our illustrations are of recently-completed work, in which Mr. C. Hadfield and C. M. Hadfield have collaborated. The church and buildings stand on the site of an old mansion and grounds formerly the property of the Dukes of Norfolk, locally known as "The Lord's House," and replaced an older chapel erected 1815-16.

We are given to understand that Mr. Herbert Goodman, A.R.I.B.A., has removed to Dashwood House, 9, New Broad Street, E.C. The telephone numbers, however, remain as heretofore.

* * *

The statement that the ancient wooden houses in Collingwood Street, Blackfriars, were shortly to be demolished, has received a flat contradiction. The owners of the property state that no scheme for rebuilding exists, nor is there the slightest probability of demolition.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible.
The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.
The querist's name and address must always be given, not necessarily for publication.

Right of Way Question.

LEEDS.—S. G. B. writes: "The owner of property A desires to break out a gateway into the street, as shown on sketch (not reproduced). Has the adjoining owner B any legal right to object? All the property and streets are old."

The answer to this question entirely depends upon the ownership of the land you mark as "Street (not taken over by public)." If this land, on which the street exists, is B's property, he certainly has the right to object to A opening out the proposed gateway. Even though A probably has a right of way over this "street" from the other gateway (which apparently exists at the opposite end of his property), B can certainly object to the proposed enlargement of A's right, and may restrain the suggested work by applying for an injunction to prevent it.

F. S. I.

Proportionate Cost of Labour in Various Trades.

YORK.—W. R. writes: "The sum of £5,000 has been paid in labour for the erection of a number of workmen's bay-windowed semi-detached roughcast cottages with baths in sculleries. The proprietor bought his own material, and put foremen in charge of each trade, consisting of (1) bricklayer, plasterer, and tiler; (2) joiner; (3) plumber and gasfitter; (4) painter. Can you kindly say what should be (approximately) the proportion of each of the four trades' expenditure in labour?"

As the proprietor bought his own materials, it will perhaps best answer this question if I say that the proportions between the cost of materials and of labour in each of the trades mentioned should be somewhat as follows:—

	Labour.		Materials.
Bricklayer ...	1	to	3
Plasterer ...	2½	,,	1
Tiler	1	,,	4
Joiner	3	,,	2
Carpenter ...	1	,,	3
Plumber, etc....	1	,,	3
Painter ...	1	,,	1

F. S. I.

Calculating Loads of Floor.

LONDON, W.C. — P. W. writes: Kindly state where I may obtain information as to the allowances usually made in America for floor loads in high buildings, especially with regard to the proportions of total live loads for which each individual floor is calculated, which are assumed to be transmitted to the walls and stanchions of the lower floors and foundations.

The practice of various American architects and engineers in regard to proportioning columns to the loads is discussed fully in "Architectural Engineering," by J. K. Freitag (London: Chapman and Hall, Ltd.). The New York Building Law specifies that for buildings exceeding 5 storeys in height, the column loads shall be made up as follows: "For the roof and top floor, the full live loads shall be used; for each succeeding lower floor, it shall be permissible to reduce the live load by 5 per cent. until 50 per cent. of the live load is reached, when such reduced loads shall be used for all remaining floors." The reports of the R.I.B.A. on Steelwork and Reinforced Concrete also made recommendations on this point.

Acoustics: Concrete Floors.

BOURNVILLE.—A. C. H. B. W. writes: (1) Kindly say where I could obtain a book dealing fully with the erection of concert-halls and dining-halls, together with the necessary appurtenances, and, if possible, say where the buildings dealt with may be seen. Also please give information on acoustics relating to such buildings. (2) Would you kindly favour me with a detail of a concrete floor, showing joists in same to receive oak flooring, say, for a load of 2 cwts. per ft., the centres of the girders being longitudinally 15ft., horizontally 6ft. (3) Will you kindly explain the exact and true method of ascertaining the various thicknesses under varying spans of cement concrete floors without reinforcement, to carry varying loads?

(1) We know of none. There is no reliable book on the subject of acoustics. The solution of such problems is in the hands of very few experts.

(2) We do not undertake to design work for readers. Apply to one or two reinforced-concrete firms for estimates and designs.

(3) There is no exact and true method. We gave an approximate method in a former issue. Our correspondent evidently desires to study structural steelwork and reinforced concrete design, and we have recommended books in answer to other enquiries in this and recent issues.

Mathematics of Modern Building.

BRENTFORD.—SEEKER writes: Having in view the great amount of steel construction used in modern buildings, and the necessity for an architect to be able to calculate the stresses, strains, and sizes of girders, etc., how much Euclid, algebra, mechanics and trigonometry, is it necessary for one to know so as to work out any problem in this construction? Also, what text books would you recommend for study on this subject.

Euclid, algebra, and trigonometry are valuable more as a training to enable a student to grasp the principles of applied mechanics more readily, but a sufficient knowledge for an architect desirous of designing steelwork can be obtained by the study of mathematical books specially written for practical students, such as "Engineering Mathematics Simply Explained," by H. H. Harrison (London: Percival Marshall and Co., price 1s. 6d. nett.). As regards books on mechanics, we recommend "Elements of Mechanics," by Mansfield Merriman (London: Chapman and Hall, Ltd., price 4s.), and "Mechanics Applied to Engineering," by John Goodman (London: Longmans, Green and Co., price 9s. nett.). As for the study of steelwork design, we think you would do well to take a course in one of the correspondence schools, who supply clear, yet efficient books, to their students.

Books on Mechanics or Physics.

LONDON, W.C.—S. X. writes: What is the best book, covering the subject of Mechanics and Physics, as given in R.I.B.A. Prelim. Exam?

Lessons in "Elementary Physics," by Balfour Stewart (Macmillan and Co.), and "Mechanics for Beginners," by J. B. Lock (Macmillan).

THE "IDEAL HOMES" EXHIBITION, LONDON.

Organised by "The Daily Mail."

The Lord Mayor, accompanied by the Sheriffs, attended in state to open this exhibition at Olympia, on Friday last. In his speech at the luncheon, Sir John Bell expressed his gratification at being associated with an enterprise which he was sure would prove beneficial to a large section of the population. It would justify its existence if it led people to study the question of increasing home comforts, for they wanted to get domesticity back to its old standard, to make home life really attractive. He also expressed his interest in the home industries section, in which Her Majesty the Queen has a stand for the Sandringham Technical School, and to the advantages of the apprenticeship system, to foster which the City Corporation had laboured for many years past.

Of the exhibition generally it may be said that, as presented, it is a disappointment. One would naturally expect to see a series of homes and rooms varying in cost and character, designed and arranged by experts, which would form models for the visitors, and possess a distinct and valuable educational influence. But the promoters, alas, do not seem to possess an ideal, and invite their patrons to select their own, out of a heterogeneous collection of exhibits that range from face powder to radishes, and boot polish to "camping-out" tents, which last seem to curiously traverse the whole idea of the exhibition. In fact, the exhibits which are in a home but not of it seem largely to predominate.

Architects will be mainly interested in the competitive designs for houses, costing £500, £750, and £1,000, assessed by Mr. E. L. Lutyens, which are shown in the gallery, the prize-winning designs being hung on the outside of Messrs. Waring's stand. There were, we understand, some hundreds of designs, submitted; but the competitors seem to have expended their ideas on picturesque exteriors, and it is a curious and informing fact that houses with the most satisfactory exteriors have poor plans, and *vice versa*. Comfort and convenience in the living and working arrangements have fared rather badly, and the housewife will lament how few competitors have considered her desire for cupboards. In the exterior treatments there is, on the whole, a praiseworthy desire for simplicity, and an avoidance of many chimney stacks and fussy gables.

Under the plan adopted in the competition, no one knows the names of the competitors until they declare themselves. Applicants were sent numbered counterfoils; one half they kept, the other half they stuck on their designs, without any name or address.

At the time of our visit but two of the competitors had declared themselves, Mr. Arnold Mitchell's card being attached to the first prize design for a £500 cottage, which wins the gold medal and £25, the prize offered for the best design in each of the three classes. Mr. Mitchell's design has a very compact square plan, having dining-room, drawing-room, small hall, kitchen, scullery, larder, fuel and servants' w.c., on the ground floor; three bedrooms, bath-room, and w.c. on the first floor; and three more bedrooms, cupboard, and lumber space on the top floor. This is extensive accommodation for £500, and it has been accomplished by putting the two upper floors in the roof; there being a large gable on each face running back to the one central chimney stack. The deep projecting eaves and the immense pitch of the roof give a top-heavy effect, which appears to be crushing the cottage into the earth. It is noteworthy that every bedroom has a fireplace, and, therefore, the ordinary and proper means of ventilation, which so many competitors have forgotten, but Mr. Mitchell has not quite escaped the common fault of putting the kitchen range opposite a window, so that people cooking are always in their own light; though the window, in this case, not being exactly opposite, gives a small amount of side light on the right side.

The first prize for a £750 cottage has been won by Mr. Frank Bromhead, with a simple and unpretentious design in the modern "English cottage" manner. This provides four bedrooms and bath-room on the upper floor, which is entirely in the roof, and dining-room, sitting or living-room, verandah, kitchen, and the usual offices on the ground floor. The kitchen range is badly placed as regards light, and the cottage has the tiny windows and forced ingle-nooks which are characteristic of its school. The first prize £1,000 cottage winner (No. 22, Motto Vil-God-I-Zal) has not disclosed his identity; and for the sake of his feelings we trust he was not by when we heard the public discoursing on his design. The remarks were merely trivial when they were not blatantly ignorant; but if it comes to deciding an ideal home on the popular vote one has tremors if the views we heard expressed are going to rule. The author of this design has taken a rectangular plan, and some idea of the Beaux-Arts planning. The arrangement of his kitchen with regard to the pantry-servery, dining-room, and front door is admirable, but his kitchen range is placed right opposite the light, and the servants' bedroom next the kitchen has no chimney. The arrangement of the inner hall with regard to the dining-room and drawing-room is also good, and the separation of the kitchen from the family part of the house and the inclusion of cupboards are notable features. The stairs cut very awkwardly across a window, however, and the corridor on the first floor is not well lighted. The bath-room is only just big enough to get into, and is flanked on either hand by the h.m.c. and w.c., each about 5ft. by 8ft. The principle of wall over wall and void over void can be carried too far. The exterior—on the ground floor—is a particularly pleasing Georgian treatment in brick, admirable up to the cornice; but from there the design goes to pieces. The bedrooms, all in the roof, are lighted by miserable little dormer windows, entirely out of scale and design with the lower part of the building, and the pitch of the roof is so low that the rooms must be horribly uncomfortable. Indeed, judging from the remarks we heard, bedrooms in the roof are not at all popular with the general public, however economical they may be.

Strolling about the main floor of the hall, where the exhibits relating to construction, decoration, heating, lighting, furnishing, etc., are arranged at the main entrance end, we came across a number of good things. At stall No. 156, BRATT, COLBRAN and CO. are showing the "Heaped Fire" grates, one in an ingle-nook setting of white and mahogany, with delicate blue-green tiles; also "Heaped Fire" grates in brass and German silver, and a number of mantels, one built entirely in tiles, others in pine and oak, and one in cast-iron with a wooden shelf. Next door, the GLOVER-LYON VENTILATION CO. have a billiard-room in full swing, with billiard and snooker tournaments twice daily, for which prizes are awarded. This apartment very ably demonstrates the capabilities of the system in getting rid of the smoke and heat, and keeping a pleasant atmosphere. The air, propelled by a fan, enters through the frieze on one side of the room, being tempenred when necessary by the firm's electric heating apparatus, and is removed through the frieze on the other side of the room by means of another fan. It need scarcely be added that the system, devised by a well-known authority on lung complaints, is planned on strictly scientific lines.

At stall No. 177, a four-roomed bungalow, THE SILICATE PAINT CO. are showing the ever-popular Duresco, used both for interior decoration and for exterior use as a preservative to the walls. The woodwork throughout is treated with the firm's Charlton enamel paint in white and green shades. At stall 179, DOULTON and CO., LTD., are showing three bath-rooms, varying in cost and luxury, suitable for different classes of ideal homes, and including various types of their sanitary apparatus. Two sections of this big stand are devoted to the Doulton art pottery, which must be seen, as description cannot convey the colour effects. There are also shown filters, work in glazed faience, and the Doulton Carrara ware. THE NEWELLITE GLASS TILE CO.'S opal tiles are a feature of one of the bath-rooms at stalls 160 and 161; and at stall 159 T. and R. BOOTE, LTD., have a fitted-up lavatory and bath-room to show a fine exhibit of tiles and faience ware; also floor tiles and mosaic, and richly-decorated tiles for friezes, panels, fire-places, and furniture. Next to them, stall 158, the "Drawwell" fire grate of CORKER and CO. will doubtless exert an influence on the public which its name suggests. Cleanliness is a feature of it, as all the ashes are collected in a fire-box in which they can be carried away. Our readers will recollect that it was one of the grates placed first in the tests of grates for the new Government offices. At stall 168, WEBBER'S PATENT WINDOWS are to be found, so designed that they can be opened either inwards or outwards for cleaning and ventilation; the fittings are not visible and their application costs little more than with ordinary windows. The fittings are applicable to casements, as well as sash windows. They are also exhibiting their patent burglar-proof window catch.

Hall's washable distemper in 70 shades is, of course, the principal feature of stall

180, SISSONS BROS. and CO., LTD. For their exhibit a section of a cottage, designed by Mr. T. Gordon Jackson, has been built up, containing a completely-furnished living-room, on which the artistic possibilities of the distemper, and the firm's other paint preparations, have been demonstrated. At stall 193, BENHAM and SONS, LTD., exhibit the Wigmore Kitchener and Independent "Wigmore" hot-water system; the former is fitted with vertical roasting fire and smoke-consuming cheeks. It is economical in fuel and a good cooker. The hot-water system provides a constant supply of hot water day and night at very low cost. Stall 197, CANDY and CO., LTD., has a handsome fumed oak inglenook, designed by Mr. Maberly Smith, as a setting to the "Devon" fire (Design A in catalogue 3), and six other varieties of the "Devon" fire in glazed briquette, faience work and wrought hand-made metal work. One design, at the side of the stand, with soft-green glazed briquette surround, had the grate recessed into the breast, so that the straight kerb came in line with the jambs. This elimination of the projecting hearth and kerb seems a happy development in the "Ideal Home." The "Devon," by the way, was also awarded a first place in the tests of grates for the new Government offices. TREDEGAR and CO. show at stall 198 a number of the wooden electric fittings in which the firm specialise. Wooden fittings are not only light, clean, and a good insulator against stray current, but it is possible to design them in harmony with any style of decoration. By their use one is able to avoid the glare of bright metal in a delicate colour scheme. These fittings are shown in every form, standards, brackets, pendants, etc. The firm also undertakes complete installations of electric light in country houses.

One of the features of this part of the exhibition, and, indeed, of the exhibition as a whole, are the number of firms showing apparatus for the new petrol-air gas, by which a mixture of 2 per cent. petrol vapour with 98 per cent of air, produces a brilliant light when burnt with an incandescent mantle. The gas is non-explosive, non-poisonous, and can be also used for both heating and cooking. The hall was quite brilliant with this light at various stalls. The mixing is effected by a small, low-power machine, usually a hot-air engine, but various motive powers are now utilised. The apparatus has the additional advantage of being extremely small. At stall 220, STRODE and CO., well known as pioneers in every form of illuminant, are showing their Aerogen machines, driven by weights, hot-air engine or water motor. They also show a selection of artistic gas fittings for gas, electric light and acetylene. The new model "DE LAITTE" gas producing machine, at stall 215, may also be driven by water, electric or any other power, or by a suspended weight. The system has been used for towns and villages, as well as single and isolated dwellings. At stall 202 the "LITZ" SAFETY GAS CO.'S "oxy-petrol" apparatus is to be seen. With their machine it is claimed that 1,200 cub. ft. of gas can be made for 1s., the proportions being 1½ per cent. petrol vapour and 98½ air. The cost of producing a light of 1,000 candles for 1 hour or 100 candles for 10 hours, works out at 1½d., as against 2½d. for coal gas, 1s. 2d. for electric incandescent, and 1s. 3d. for acetylene. The "Litz" firm distribute a useful little pamphlet, containing numerous testimonials to visitors who call at their stand. In the "LOCO" VAPOUR-GAS SYSTEM, stall 225, the petrol tank is placed outside the apparatus building, to avoid all possible danger, and the gas is recommended for lighting, heating and cooking, also for singeing cloth, gassing yarn, etc. Economy is claimed in first and working costs, and purity in the light and gas. Cooking and heating apparatus are shown by all the firms.

At stall 221, the LONDON WARMING AND VENTILATING CO., LTD., are showing numerous examples of their anthracite stoves, in the manufacture of which they are pioneers. They show the "Senior" open fire, burning anthracite, and also numerous closed stoves. These stoves are now very well known; but the general public will now have a very good opportunity of seeing and testing their advantages.

At stall 223 GEORGE WOOLLISCROFT and SON, LTD., are showing "Down-draught" fires, in appearance like a well or sunk fire, constructed in fire-clay, with a narrow below the coal level, which induces a powerful draught to enable the fire to burn anthracite. The firm are also showing their "Raglan" mantel, and examples of glazed floor and roof tiles, for the manufacture of which they are well known. Before finishing these notes on the exhibition, to which we further refer next week, mention should be made of the fine exhibit by DAVIS, BENNETT, AND CO., at Stalls 160, 161. Here may be seen four model bath-rooms, ranging from one suitable to a labourer's cottage, to one designed for a palace, a model kitchen, all kinds of sanitary apparatus and fittings, ozonators for discharging artificial ozone in houses, and incandescent gas lighting; but the feature of the exhibit is the bathroom with onyx fittings, which will doubtless draw all visitors to a prolonged contemplation of its beauties.

THE A.A. BROWN BOOK.

The Architectural Association's "Brown Book" for session 1908-9, which has just been received, affords a complete conspectus of the varied activities of the Association, and is to the junior organisation what the Kalendar is to the R.I.B.A. We quote particulars of the interesting list of meetings: October 9th, annual general meeting, president's address (Mr. Walter Cave, F.R.I.B.A.) and distribution of prizes; October 23rd, "Michael Angelo as an Architect," by Professor Beresford Pite, F.R.I.B.A.; November 6th, "The Origin and Sense of Taste in Art," by Mr. Felix Clay; November 20th, "The Church of Santa Sophia," by Mr. J. B. Fulton, A.R.I.B.A.; December 4th, "Early Studies and Future Practice," by Mr. William Dunn, F.R.I.B.A.; January 8th, 1909, "Building Materials," by Mr. H. D. Searles-Wood, F.R.I.B.A.; January 22nd, "Schools," by Mr. H. T. Buckland; February 5th, "Reinforced Concrete," by Mr. John H. Markham, A.R.I.B.A.; February 19th, "The Press and Architecture," by Mr. A. Needham Wilson, A.R.I.B.A.; March 19th, "A Lesson from the Past," by Mr. J. A. Marshall. These meetings are held at No. 18, Tufton Street, Westminster, at 7.30 p.m. The subjects for March 5th and April 30th are not yet announced.

(MONTHLY.)

FRENCH SCAFFOLDING.

Some Impressions, and a Comparison with British Methods.

By A. G. H. Thatcher.

The general principles adopted by the French builders in erecting scaffolding are, to a great extent, allied to those adopted in this country, using this word to embrace Scotland. For it is somewhat curious that the Scottish builders have in use types of scaffolding but little known in England, which approximate closely to those of France. As an instance, the Scottish gabbard may be mentioned. This has its double in a system commonly seen across the Channel, with the difference that while there the standards are of whole timbers, in the north they are built up of scantlings. The Scottish derrick does not seem to be known, or, at any rate, used by our neighbours; in its place, a single tower is built, again of whole timbers. Of course, it cannot carry a crane, and, therefore, its use is more restricted. Pole scaffolding, as may be expected, has great points of similarity, the differences (to be considered later) being chiefly in matters of detail. Minor appliances in every day use are of similar character to ours, and perform similar duties, such differences as may be seen being more in their construction than otherwise.

To deal with the framed construction first. Fig. 1 is produced from a photograph of a portion of the west front of Rouen Cathedral, which is at present undergoing extensive repair. Whole timbers are used for all standards; the transoms and braces are of 6in. by 2in. scantling. Figures 2 and 3 show a single bay in detail. The standards cannot, of course, be obtained in a single piece, and in this instance the connections were made by halving and bolting; although, as will be seen later, this procedure is not always considered necessary. Bracing is fixed both ways, and shoring from the outward side is put up to keep the structure steady. Bolts are not used for all connections, the smaller timbers being simply nailed in their place. Certainly, the nail, or, more properly, the spike, is a powerful one, being used up to 10in. in length, but to a Scotch scaffolder, used to bolts for all these purposes, there certainly seems room for improvement.

As before noted, the use of this type of scaffolding approximates to the use of the Scottish gabbard, and similar means are taken in each case to enable the mechanic to reach his work where a recess occurs in the building. Fig. 4 shows the arrangement in the gabbard, the needle continuing through the standard to the required distance, and Fig. 5 shows the French method, with the transoms fixed on the outside as well as the inside of the standard, and continued in a like manner. The system of fixing the transoms in pairs undoubtedly minimises the risk of failure that would occur if the spikes drew from overloading or similar cause.

Although squared timbers are generally used for the standards, it is not uncommon for unconverted logs to be put to the same purpose. So far as actual strength is a requirement, there can be no objection to this, but the extra difficulties it presents to anything approaching accurate framing make it an undesirable procedure.

The timber towers used for hoisting material seem to form the easiest means possessed by the French builder for carrying out this work. Fig. 6 is an illustration of one put up for the erection of a building near the Place d'Italie, Paris. One of the first things that strike an observer in Paris is the very free use made by builders of the pavements, and even of the roads, if necessary, for any purpose, and this photograph shows no exception to what appears to be the rule. To erect one of these towers, a hole is first dug about 4ft. deep for the insertion of each leg. Balks are chosen for these if the weights are considerable, otherwise poles serve the purpose. It happens, of course, that greater height is sometimes needed than can be gained with one piece, but this is allowed to present no difficulties. The length is laid upon the ground, and an extra piece is butt-ended to it. Two pieces of wood sufficient in length to give a considerable lap are nailed on, as shown on Fig. 7, and up the arrangement goes. Nothing more simple.

To properly appreciate the raising of these legs to a vertical position, one

must possess a sense of humour. The hole having been dug, a derrick is needed which requires a detailed description. Fig. 8 gives a general view of one. They are made up to 30ft. in height, and are fitted at the top with a pulley wheel. The sides are tied together, with rungs placed about 2ft. apart. These are made removable, so that the whole arrangement can be taken apart. Where the lowest rung might be fixed, a capstan drum is placed. From the drum a fall is taken over the pulley wheel and fastened off to the timber leg, catching it at about its centre, so that the lower and butt end is slightly the heavier. Everything being now prepared, the scaffolder, who, if not a man of importance, certainly should be a man of weight, climbs the rungs above the drum, into which he inserts a capstan bar about 7ft. in length. Clinging firmly to the extreme end of this, he literally throws himself backwards, and after frantic struggles ultimately reaches the ground, having by this means given the drum a quarter revolution (Fig. 9). His companion immediately follows his example, the placing of the second bar in the drum effectually locking it, and preventing the fall running down, should the first man release his weight. The sight of a stalwart Frenchman so engaged makes one appreciate the value of athletic exercises. It should be seen; a verbal description does not do the performance justice.

The leg, on arriving at a sufficient height to swing clear, is manipulated so that the butt end drops into the hole. This is then rapidly filled in, and the performance repeated with the other legs. They stand square on plan, and are about 10ft. apart. Transoms and braces are nailed into place, use being made of a pulley fixed at the top of one of the legs to raise these as required. At the extreme height extra timbers are laid across the centres of the transoms, and a pulley is fixed to this for raising the material. On one of the legs cleats are nailed. These can be seen on Fig. 6, and are for climbing purposes, should this be necessary at any time after the structure is erected. The winch used for lifting is fixed in a vertical position on the tower itself. Fig. 10 is an illustration of how this is done, arrangements being made in this case for the application of power.

These towers are commonly seen in use with pole scaffolding. This method of scaffolding is of an altogether lighter type than seen in this country, except for our smaller classes of buildings. The timbers are, as a whole, of an inferior standard; the quality of straightness, for instance, is certainly not considered a necessity.

The French buildings being frequently of stone, it would not be expected, from our point of view, at least, that the single-pole standard would be so regularly used. Yet such is the case, the puncheon which we use with masons' scaffolds being apparently unknown. When the height demands an additional pole, it is simply lashed to that first erected, and entire dependence is placed upon the lashing for a proper connection. The English scaffolder, with a better appreciation of the extent to which cordage can be trusted, makes it a practice, where a puncheon is not needed, to stand the rising standard upon a putlog resting on the ledgers, and there can be no doubt his method is the better one. The ledgers again give the impression of being lashed in a most haphazard fashion. A simple lap which does not often cross two standards, with no bearer beneath, is the usual means of increasing length. The putlogs are short ends of poles, birch not being in favour for this purpose. Occasionally scantlings are to be found, this being a practice sometimes seen in this country. There is an element of safety in the use of pole-ends, as they have to be lashed in

position owing to their tendency to roll, and this undoubtedly stiffens the erection. Being of such irregular growth, however, the sheeting naturally lies somewhat loose.

(*To be concluded.*)

Contractors' Notes.

A correspondent in the "Hereford Times" is asking why the builders of Hereford, and those who contemplate building, do not build houses suitable to the pockets of many of the residents of Hereford. Says the writer:—"Go where you like, you cannot get a decent house unless you pay a rent quite unsuitable to the small wage-earner. I myself have made inquiries about several lots of new houses recently built, and am told that they are £17 to £18 rent, which, with the rates, mean £21 to £22, or over 8s. per week. What we want in Hereford are the following two types of houses: Those to let at £17 to £18 (clear), and the others suitable to the working-man at £12 to £13 per year, or 4s. 6d. to 5s. a week. I have myself been asked by eight different people this week, four of them new-comers to Hereford, if I could tell them of decent houses at a decent rent, and nothing of the kind is to be got. As you know, the wages in Hereford are very low." Perhaps the builders of Hereford—"not to mention those who contemplate building"—will kindly oblige.

A novel case under the Workmen's Compensation Act came before his Honour Judge Thomas, sitting at the Southport County Court, at the end of last month. It concerned the registration of an agreement entered into by Messrs. A. K. Irving and Sons, contractors, of Southport, and Edward Herkes, a wood machinist, employed by the firm, who had his right hand badly maimed in a moulding machine. The latter was earning 37s. 3d. a week at the time of the accident, and the firm and their insurance company paid half his wages while under medical treatment. In January he made a claim for a lump sum of £150 in settlement; and received from the firm and the insurance company an offer of £75, to which he demurred, and the offer was then reduced to £65, the applicant being told that the longer he delayed the less he would get. Under this duress, and in ignorance of his rights, he agreed to accept the sum; but the Registrar of the Court refused to register the agreement on the ground of inadequacy; and being permanently partially-incapacitated, as testified by the judge's medical referee, a sum of £417 would be required to secure the weekly allowance to which he might be entitled. His Honour said under the circumstances he must hold that the allowance was inadequate, and, therefore, he could not register the agreement. With regard to the insurance company, he must say that the agreement was not properly and fairly obtained by them. It would now be for the workman to commence an action if he and his former employers could not come to an amicable settlement. Costs were allowed on B scale. The moral of this would seem to be that contractors will have to be careful in their dealings with the insurance companies, or they may be let in for a certain amount of moral obloquy which they do not deserve, since they have insured for the settlement of claims upon a just and equitable basis.

The "Northern Echo," Darlington, commenting on a slight increase in building activity at Newcastle, states that house building in that locality is still very slack, a condition that it attributes to "the predilection of the jerry builder for building streets of flats from which people are eager to escape when anything better comes in their way." Our contemporary goes on to say that though in several places in the Newcastle district "there is half a street at a time unlet," the builder "who is busy a few streets away is engaged in putting up the identical type which his own eyes can convince him are a drug on the market. That there is an opening for a more intelligent and healthy method of building is quite apparent in the rush for new self-contained little houses, no matter how small they may be. But the builder does not seem to read the signs of the times at all. He persists in erecting the same type of dwelling his father built before him, and does not vary one iota from the design or the ugliness of those his predecessors put up." The northern speculative builder might take a leaf out of the book of some of his London confreres, and enlist the services of an architect—not merely an architect, but a good architect. A "Willett" house is a recommendation in an estate agent's advertisement; the Bedford Park Estate has been a very satisfactory essay in speculative work; and for a cheaper class of dwelling, the streets designed by Mr. Walter Cave, lying between Little Road and North End Road, Fulham, are well worth a builder's inspection.

Matters of Opinion.

No. 1 (continued).—The Increased Employment of Specialist Contractors—Architects' Opinions.

Though we are informed, on the best authority, that contractors feel aggrieved over the increasing employment of specialists, particularly in the case of joinery work, our attempt last month to get them to voice that feeling was hardly so successful as we could have wished. The opinions we then gave from three important firms have encouraged us to carry the matter further, and it having been suggested that opinions from prominent architects would be helpful in forming an opinion on the merits of the case, we sent a letter to a number of well-known architects practising on the Southern English system. As is, of course, well known, buildings in the North of England and in Scotland are usually erected by a number of contractors, each specialising in a different trade; and the difficulties to which we have drawn attention do not in such case obtain. The letter was as follows:—

"During the last few years the practice of employing specialist contractors, especially in the finer and finishing trades, has greatly increased. We have received numerous complaints from contractors that, although they have fully-equipped joinery workshops, they seldom get a chance of executing the woodwork on buildings for which they are general contractors; and that with the numerous obligations imposed upon them, and severe competition, their position, in many ways, is becoming intolerable. In one recent contract brought to our notice, close on 40 per cent. of the amount consisted of p.c. sums for specialist firms, over whose action the general contractor had no control whatever, but for whose work he had to accept full responsibility. If the joinery, for instance, warped or shrunk out of the true to the extent of one-eighth of an inch, he had to reinstate it. Grave difficulties have occurred, also, in connection with the Workmen's Compensation Act.

"Contractors are, therefore, prepared to press for some alterations in the National form of contract, but it has been suggested that if some of the leading architects would give their reasons for preferring to employ specialists for much of the work in their buildings it would help to a better understanding of the matter, and possibly suggest a way out of the difficulty."

In answer to this we have received a number of replies from well-known architects as given below:—

MR. F. DARE BRYAN, F.R.I.B.A., Bristol.

Specialist contractors can be divided into at least two divisions; in the first I place those whose work is of such a nature that it would be difficult or impossible for an ordinary builder to execute it, and it would be detrimental to success that the selection and control of these workers should be left to the general contractor. On the other hand, special firms for such things as ordinary wood block flooring, plastering and joinery, which may be placed in the second division, are not necessary in the case of reputable firms, but with the class of builder who often responds to public advertisement it is advisable to protect the building owners by at least retaining the right to employ specialists. The desirability also of limiting competition amongst specialists as regards price is also apparent, and this would not be so conveniently obtained if the sub-contracts were concluded by the general contractor. As regards the responsibility of the general contractor for specialist work, this certainly ought to be strictly limited, and in many cases entirely abrogated; but to those who know the large extent to which contractors sublet even such ordinary work as I have placed in the second division, the agitation on their part seems somewhat unnecessary. Where architects are at liberty to invite well-tried men, they would, I am sure, be only too willing to entrust them, not only with the joinery, but all the work except that which I place in the first division. A multiplicity of contractors does not lessen an architect's labours, and when builders can convince the profession that they are thoroughly competent to do work of a special character, they will doubtless be entrusted with it. The system of specialists is, however, in my opinion, a necessity of the times, and the policy of the builders should be to regulate it, not to oppose it, and in this direction I think that they may rely upon the co-operation of architects.

MR. R. A. BRIGGS, F.R.I.B.A., London.

It is quite true that the practice of employing specialist contractors has greatly increased. It is a phase of the times. As fresh forms of construction and finishings are invented or adopted, so must the the number of specialist contractors increase. There must, in my opinion, be specialist contractors for steelwork, and in large works it is usual, I think, to have specialist contractors for the heating, sanitary work, carving, marble work, etc. I do not, however, see the necessity for employing a specialist contractor for the joinery and woodwork. The case you mention seems to me to be very unfair, viz., that the *general* contractor should be responsible for the work of the *specialist* contractor. I have never before heard of such a case, and am surprised that any responsible contractor should have agreed to such a condition. Where specialist contractors are employed, separate certificates should be given to them direct.

MR. WALTER CAVE, F.R.I.B.A., President Architectural Association.

I think that architects should not introduce specialists into their buildings unless they are convinced that the work required is beyond the power of the general contractor employed. If it becomes necessary, as in many cases of decoration, to employ a specialist, he should be under a separate contract, and the general contractor relieved of all responsibility. Special attention should be paid to the points of overlapping in the work. The tendency is towards greater luxury; life is becoming more complex; our necessities are increasing, and different standards are being established. The inevitable result is the appearance of the specialist in all professions and trades. He has to be reckoned with as the natural outcome of the movement of events, and I believe that it is only a matter of time before he overwhelms what we now know as the "General Contractor."

MR. ALFRED W. S. CROSS, M.A., F.R.I.B.A., London.

That the increasing tendency of architects to insert in the building contracts under their control many provisional sums to cover the cost of work to be executed by sub-contractors or specialists nominated by themselves often creates a situation that is exceedingly detrimental to the financial interests of the general contractor, may be at once conceded. But the specific complaints of certain contractors to which you refer, to the effect that although they possess fully-equipped joinery workshops, they seldom get a chance of executing the woodwork on buildings for which they are the general contractors, are of a somewhat startling nature, as I had no idea that this, in my opinion, most unfair application of the system of sub-contracting was prevalent, and certainly it ought not to be allowed to continue. With regard to the other grievances you mention, surely the general contractor's *responsibility* for defective workmanship or materials supplied by the sub-contractors, or his liability (arising from the employment of the sub-contractor), under the Workmen's Compensation Act, is fully covered by Clause 20 of the Form of Agreement and Schedule of Conditions for Building Contracts issued under the sanction of the R.I.B.A. in agreement with the Institute of Builders and the National Federation of Building Trade Employers? Broadly speaking, I think that no work which is included in the contract ought to be taken out of the general contractor's hands, provided he is fully competent to execute it, except when reinforced concrete or any other comparatively novel method of building is adopted, in which case until its use has become more general and its inherent properties better understood than they are at present, I think that most architects would be extremely ill-advised *not* to employ a specialist. I must also plead guilty to being sufficiently conservative in my views to prefer, as a general rule, to see constructional steelwork fixed by constructional engineers. Contractors should not lose sight of the fact that provisional sums are sometimes included (by the architect) in the specification, merely as a protective measure in case a pending contract should be secured by a builder whose reputation is not of the best.

MR. C. E. MALLOWS, F.R.I.B.A., London.

My custom is to employ the general contractor for a building to also undertake the woodwork, except in special cases where it is obvious a contractor does not possess the facilities necessary for the proper execution of it. In such cases, as doubtless you are aware, the general contractor applies to the specialist, and this custom has doubtless given rise to the state of affairs of which you say complaint is being made. The reason, therefore, which induces me to go to the specialist direct is sufficiently obvious.

MR. WILLIAM A. PITE, F.R.I.B.A., London.

I am fully aware that firms of contractors of position and eminence among their less prominent colleagues complain, and not without reason, that work which should reach them goes to specialist firms.

One can naturally understand the irritation that this must cause; and from the contractor's point of view the subject of specialists is an ever-vernal one.

It is difficult to answer the question briefly, which is one better suited, perhaps, for friendly conference, as there is something to say on both sides, from the varying conditions which govern any particular case in point.

Four trades may be instanced which

suggest some considerations in constructional steelwork. If the proposal is for steel-framing, it is reasonable to assume that an approximate weight as a provisional item can be included in the estimate which would enable the contractor to negotiate to his own advantage, and that of his employer, in a way that the selection of an excessive patent prohibits.

Generally, wherever possible, the whole of the joinery, and the hard woods in particular, can be obtained with better material and workmanship from a contractor possessed of fully-equipped shops, at a lower rate, probably, than from a specialist. Plain plastering, naturally, should come to the contractor; but the case is different with decorative plaster work, which is now of such a nature that it is a growing custom to employ a craftsman for the purpose. I am sure that all who have the art of architecture at heart, and among these we gladly recognise many eminent builders, the association of brilliant craftsmen with the architect is a matter for sincere congratulation. Sanitary plumbing, however, stands by itself, and registration has brought perfection to the trade and safety to a trustful public. Contractors are quite capable of providing any sanitary plumbing work. Finally, I would say that, speaking generally, that specialists should only be engaged where particular considerations call for such employment, and that, unfortunately, much desirable work is now diverted from the contractor's province, without reason, to some other source.

I am convinced, however, that no manner of good can result from seeking to enforce such a very desirable condition of affairs upon the National Contract.

MR. JOHN W. SIMPSON, Vice-Pres. R.I.B.A., London.

I have not heard of this complaint before, and do not understand it. If a contractor accepts responsibility for work, he does not personally control, it is presumably because he takes a profit upon it, and covers the risk by his own arrangements with the sub-contractor. In the case of patent systems of steel construction, marble or faience-ware, fibrous plaster, engineering, and many other matters, their inclusion in the general contract under the form of P.C. sums is to the advantage of the general contractor; at any rate, I never heard of one who desired to have them omitted. It should be remembered that the builder in London and the south is in most cases a financier farming various trades, and taking certain risks in the hope of profit. The contractor of the Midlands and the North—a master mason, joiner, or what-not—undertaking his own trade work and no other, is precisely what you refer to as a specialist contractor; and if architects distribute the trades direct to the workers, instead of employing an agent, it is doubtless because they find the work thus done better or cheaper, or both. As regards the subject of woodwork, which you specially mention, my rule is to entrust it to the general contractor, and he has nearly always served me well.

MR. ARTHUR H. RYAN TENISON, F.R.I.B.A., London.

I understand that there is a growing feeling of discontent amongst contractors, arising out of architects specifying specialist firms to execute the joinery in their works. From my own point of view, I consider that architects are only too ready to leave the making of joinery with the contractor when he can conclusively prove that he has the shops and plant for carrying out the work in a high-class and satisfactory manner. I always adopt this course myself. I venture to say that where an architect is permitted to select or appoint the contractor, sub-letting, whether by direct order of the architect or no, is never necessary. Why the necessity for the architect naming a specialist firm has arisen must be obvious to all concerned, viz., where open tendering or tendering by firms unknown to the architect takes place. I am not aware of any case where a contractor has omitted to add his 10 per cent. or 15 per cent. commission upon specialists' prices, and this being so, and the fact that no specialist to my knowledge has ever refused to make good his own work at his own expense if called upon to do so, I cannot say that I am convinced of a grievance existing.

MR. PERCY SCOTT WORTHINGTON, M.A. (Oxon), F.R.I.B.A., Manchester.

The custom to which you refer has grown up owing to the fact that so many builders are not in a position to carry out work of a special character. Personally, I prefer good joiners' to cabinet-makers' work, and act on this principle. But the experience is sometimes a bitter one. Good timber is increasingly difficult to get; most builders' businesses are too largely merely financial concerns, and a turnover is more regarded than a proper stock of seasoned timber. With regard to carving, ornamental plaster, lead and other work, these are obviously outside the scope of a general contractor's business. But I think that the case may be met by general contract clauses by which the contractor is to be responsible for special work, and for claims under the Compensation Acts, in all cases where an item for contractor's profit is provided for in the quantities after an included sum. If the contractor does not price these items, in anxiety to cut his estimate, that is his own fault. It seems only fair to a contractor to communicate to him, either in the quantities or as the occasion arises, the names of firms proposed as sub-contractors for special work.

Holborn Town Hall has been bought in the interests of the Primitive Methodist Church.

With reference to a paragraph in p. 262 of last week's issue, in which it was stated that a large London contract for plastering and reinforced concrete work had been secured by a well-known Liverpool firm of plasterers, we are now at liberty to say that the contract in question is that for the Selfridge stores in Oxford Street, W., which are being built at a cost of about £250,000. The plastering work and the construction of the reinforced concrete staircases at these mammoth stores have been entrusted to Messrs. Henry Johnson and Sons, plasterers, slaters, and tilers, of Primrose Hill, Fontenoy Street, Liverpool, who have also secured contracts on the following works in progress:—Tower Buildings, Bibby's Buildings, and Blackler's Emporium, Liverpool; King Edward VII.'s College, Lytham, near Blackpool; the new town hall, Lancaster; and others in London.

Proposed New Works.

Aberdeen.—The Town Council has sanctioned plans for the following works: Two dwelling houses on the west side of Polmuir Road, for Mr. A. G. D. M'Killigin; Messrs. Sutherland and George, architects. Motor car shed, at the rear of No. 1, West Craibstone Street, for Dr. James D. Wyness; Mr. G. Bennett Mitchell, architect. Four dwelling-houses on the west side of Albury Road, for Mr. Thomas Reid, shoemaker; Messrs. D. and J. R. M'Millan, architects. Addition to granite works on the east side of Hardgate, for Mr. William Taggart, granite merchant; Mr. Duncan Hodge, architect. Five dwelling-houses on the west side of Holburn Street, for Mr. Joseph Shirras, builder.

Banks, Lancs.—A meeting has been held to consider the erection of a public reading-room.

Beckenham, Kent.—The U.D. Council have passed plans for five houses, Belmont Road, A. and R. Westerman; four houses, Marlow Road, J. Hughes; additions, 43, Cator Road, Jones and Andrews; motor house, Court Downs Road, Copeland and Son; one house, Stanley Avenue, J. Andrews; three houses, Blandford Road, Golder and Co.; one house, Stanley Avenue, D. W. Morris; additions to Heathfield, Scott's Lane, M. Zimmerman; six houses, Clock House Road, F. D. Rodda.

Belfast.—The Markets Committee of the Corporation have strongly recommended the Council to proceed at once with the erection of a new abattoir on the Stewart Street site, at an estimated cost of £32,118. The work was sanctioned eight years ago by the Local Government Board, who have written complaining of the delay.

Cardiff.—The Local Government Board has written to the Board of Guardians authorising alterations to the workhouse laundry to the extent of £2,608, and extensions at Ely Homes Hospital at a cost of £850.

Chelmsford.—The Town Council have passed plans for the following:—Three cottages, Burgess Well Road, for Mr. James I. Taylor; four cottages and shed, Church Street, Moulsham, for Mr. G. T. Bedingfield; two detached houses, Rainsford Road, for Mr. F. Cracknell; offices, Duke Street, for the Essex Education Committee; house and stables, Primrose Hill, for Mr. Arthur Cowler; and two pairs of flats, Trinity Road, for Mr. William Rosser.

Chippenham, Wilts. — The District Council has approved plans of alterations to a house at Kingston Langley for Earl Cowper, of alteration to "The Cleeve," Corsham, for Mr. F. J. Chapman, and of two new houses on the Ladyfield Estate for Mr. Rogers.

Doncaster.—The plans for rebuilding the Brown Cow Hotel in Frenchgate have been passed.

Eltham.—A new branch is to be erected in the High Street for the London and South-Western Banking Co., but progress is at present stopped, pending negotiations by the Woolwich Borough Council to set back the proposed frontage line in connection with a widening improvement.

Fosdyke, Lincs.—The Holland County Council have approved the plans of Mr. Healey Johnson, Boston, for a new bridge here over the River Welland.

Handsworth.—The District Council have applied to the Local Government

Board for sanction to borrow £3,100 for street improvements and the construction of a new street from Rookery Road to Friary Road. An enquiry will be held.

Hornsey, Middlesex.—The Borough Council has approved the following plans: Two dwelling-houses in Colney Hatch Lane, Muswell Hill, Mr. Edmund Cude, Archway Road, Highgate; shop in Campsbourne Road, Hornsey, Mr. A. T. Hill; additions to No. 28, Grand Avenue, Muswell Hill, Mr. W. J. Collins; alterations in and additions to No. 10, Victoria Parade, Muswell Hill, Mr. D. A. Whitehead; and amended plans for seventeen dwelling-houses in Southwood Lawn Road, Highgate, by Mr. A. G. Shearing, Kentish Town.

Hull.—The Somerset House property, Anlaby Road and Walton Street, has been purchased on behalf of the East Riding Territorial Association for their new quarters. Messrs. Wellsted and Dosser, and Mr. Arthur Easton have been requested to prepare preliminary sketches for the necessary buildings on this property, and also plans and estimates for the other quarters at Park Street, the work being divided between the two firms of architects.

Hull.—The Corporation has passed plans for the following:—J. E. Mallison (amended), one house and shop, Newland; W. Finch (amended), six houses, Westminster Avenue; G. B. Cheeseman (amended), seven houses, Reynoldson Street; J. Wood, four houses, Durham Street; G. T. Spruit, seven houses, Ventnor and Exmouth Streets; Garden Village, Ltd., eight houses, Garden Village; ditto; F. Allon, 12 houses, Blaydes Street; F. J. Watts, nine houses and two shops, Hessle Road; G. Wardell, two houses, Victoria Avenue; J. T. Taylor, eight houses, Whitworth Street and Southcoates Avenue; G. T. Spruit, two houses, Inglemire Lane; A. Whincop, 16 houses, Essex Street: Mrs. L. Charles, two houses, Aberdeen Street; Garden Village, Ltd., 34 houses, Garden Village, and 24 houses, Garden Village; J. T. Taylor, three houses, Holderness Road; W. Finch, eight houses, East Park Avenue; Garden Village, Ltd., one house, Garden Village; Mrs. P. Smith, 14 houses, Devon Street; J. H. Osborne, 14 houses, new street, Anlaby Road; J. E. Wright, eight houses, Marlborough Avenue; H. Hornsey, 16 houses, Estcourt Street; Trustees of Mission, mission, Great Thornton Street; British Petroleum Company, stores, Dairycoates; Yorkshire Baptist Association, chapel, Holderness Road; Blundell, Spence, and Co., methylating works, Bankside; Wray, Sanderson, and Co., offices, Morley Street; Trustees, Pearson Institute, extensions, Cleveland Street; B. B. Mason and Co., reconstruction of premises, Lowgate; G. Taylor, shop, Jamesson Street; Reckitt and Sons, Ltd., extensions, Dansom Lane; Hull Brewery Company, Ltd., Duke of York, Garden Street; Hull General Builders, Ltd., office, etc., Lockwood Street; Trustees, Primitive Methodist Church, class rooms, Fountain Road; Trustees, Hull Royal Infirmary, additions, Mill Street; A. Scott, workshops, Maxwell Street.

Ilford.—The surveyor to the U.D. Council has prepared plans and estimate for a dust-destructor. Application has been made to the Local Government Board for loans of £8,115 for the buildings, and £6,885 for the destructor, or £15,000 in all.

Leatherhead.—It is proposed to built a new elementary school for 100 pupils at a cost of about £4,000. At present all the schools in the parish are Church of England schools, and the new building is required to bring the accommodation up to the requirements of the Education Committee. If the church authorities are unable to raise the funds, the County Council will proceed to do so, at the cost of the ratepayers.

Leyburn, Yorks.—Messrs. W. and T. R. Milburn, Sunderland, are the architects for 24 houses which it is proposed to erect on land between Leyburn and Middleham. The Leyburn Rural Council are considering the provision of an isolation hospital for their district.

Leyland.—The U.D. Council are contemplating the erection of a new fire-engine station. The site has yet to be fixed.

Lincoln.—A new church is to be erected in the parish of St. Swithin's; and a site has already been secured at the end of Bridge Street, at a cost of £260.

London, S.W.—It is proposed to pull down some of the Crown property on the west side of the Haymarket, adjoining St. James's Market, widen the entrances to the market, and erect new blocks of business premises. Negotiations between the Crown authorities and the Westminster City Council, as to the width of the new streets, are now proceeding.

Malton, Yorks.—The postal authorities are about to erect a new post-office here.

Margate.—The Borough Council has provisionally agreed to buy the Kursaal site for the purpose of erecting a concert pavilion and winter gardens. The sum mentioned is £16,000.

Motherwell.—The Dean of Guild Court passed plans for a range of dwelling-houses in Shields Road. The plans show 23 houses of one room and kitchen, 11 houses of two rooms and kitchen, and two single apartments. There will be ornamental garden plots in front of the houses. Messrs. Muirhead and Ferguson, joiners, had plans passed for dwelling-houses in Gavin Street, consisting of three two-room and kitchen houses and five houses of one room and kitchen. Plans were also passed for the new chambers to be erected in Brandon Street by the Dalziel Parish Council, consisting of inspector's office, board-room, registrar's office, and dwelling-house, the estimated cost being £2,500.

Perth.—The directors and subscribers of the County and City Royal Infimary have agreed by 36 votes to 24 to build a new infirmary, at a cost of £30,000 to £40,000, instead of reconstructing the old one at a cost of £15,000.

Saltaire.—The proposal to extend the Sir Titus Salt Hospital has been postponed by the Governors, pending an enquiry to ascertain the desirability of erecting a new hospital. This latter course is urged by the District Council.

Scarborough.—The Marine Drive Subcommittee of the Scarborough Town Council have approved a scheme to cost £2,000 for a protective apron to the damaged section of the Marine Drive.

Southport.—A new variety house, to be called the Empire Theatre, is proposed to be built in Lord Street, at a cost of £45,000. The buildings will comprise, also, a handsome ball-room, shops, and offices. The theatre is to be erected ready for opening next August during the season.

THE SOUTH WALES COTTAGE EXHIBITION.

Awards for the Site Plan.

We have received from the National Housing Reform Council, under whose auspices this exhibition is to be held, the judges' report on the designs submitted for laying out the site. The report, which is signed by

George T. Brown, F.R.I.B.A.,
(President Northern Architectural Association),
Marcus Hoskins, F.S.I.
(Swansea Corporation Estate Agent),
H. Bedford Taylor
(Architect to Bournville Village Trust, &c.),
Raymond Unwin
(Architect First Garden City, Ltd., and Hampstead Garden Suburb Trust),

is as follows:—

"We carefully examined the plans sent in for this competition, and after eliminating about 80, we went into the minute details of those remaining, and it was only after a considerable amount of careful comparison and discussion that we were able to arrive at a final decision.

"We award the Gold Medal to the design sent in by

Mr. James Crossland, Architect,
Broughton-in-Furness.

We consider this design deserves the first place on account of the careful consideration given to the contours of the site, the economical arrangement of roads, the treatment of the aspect, the possibilities of picturesque treatment in town planning, and the general practicability of the design for the purposes of the Cottage Exhibition. We hope, however, that in one or two places additional depth may be given to the plots which are rather too shallow.

"The design submitted by

Mr. Gilbert Waterhouse, Architect,
Park House, Buckhurst Hill, Essex,

is awarded the Silver Medal, in spite of the small frontages provided for the cottages, and the fact that some of the side roads, do not comply with the by-laws as to width. The contour arrangements are excellent, the total lengths of roads low, the treatment of aspect good, and the design possesses so much architectural merit that we have awarded it the second prize.

"The design sent in by

Mr. John W. Aldiss, Architect,
Newbridge, Mon.,

is placed third on account of the great economy in the construction of the roads and consideration of aspect and sea view. The general access from east to west is, however, defective."

We regret that pressure on our space prevents us from publishing in this issue the winning designs, with a precis of the authors' notes on the same, but we hope to do this in our next issue.

With reference to the article on "Building Monolithic Concrete Walls," on p. 275 of our issue for October 7th, we are informed that the Monocrete Construction Company, of Cheltenham, have arranged an agency for three years with a first-class Australian representative, and that agencies have been also established for Egypt, India, and Cyprus. It is further announced that the French Government are largely adopting the Monocrete machines for barracks and fortifications, and for colonisation requirements.

THE BUILDING TRADES' EXHIBITION,

BINGLEY HALL, BIRMINGHAM.

The Lord Mayor of Birmingham opened this exhibition at Bingley Hall, on Monday last. Federation members visiting Bingley Hall are invited to inspect our stall (No. 79), where copies of our various publications are on view and on sale, and where our representatives will be glad to answer inquiries and to receive advertisements. Our friends are asked to regard our stall as a convenient rendezvous, where appointments may be kept, parcels received, and letters written.

Among the prominent exhibits may be mentioned the following:—

THE AEROGRAPH CO.'S SPRAY-PAINTING APPARATUS.

Two new outfits for plain and ornamental painting are shown by the well-known firm of spray-painting apparatus makers, the Aerograph Co., Ltd., of 43, Holborn Viaduct, London, E.C. One of these outfits comprises the pressure machine with a petrol motor, mounted on a trolley, and we illustrate below the handpiece or "Aerograph" spray-painter. The spraying nozzles of these instruments can be made large enough to cover at almost any speed; but in practice it has been found best to make them of a size to do from three to five square yards per minute, and give a good even coat. This shows a great saving of time and labour. For wall and ceiling decoration, the spray painter, or a smaller spray known as the "Pistol" pattern, will be found very useful. The possibilities in the way of graduated tints, and the perfect blending of colours, must be seen to be duly appreciated. Either oil or distemper colours may be used, and the work can be done on any surface. One tint can be put over another without waiting for the first to dry thoroughly; no washing up or muddy tints are produced. Each outfit consists of the handpiece or "Aerograph" spray-painter, an air compressor, paint pot and tubes, and the motor, but a smaller apparatus is supplied for decorative work, to be used with a hand-pump.

ARMOURED TUBULAR FLOORING, E. C. AND J. KEAY'S CONSTRUCTIONAL STEELWORK, ETC.

The stand erected for Messrs. E. C. and J. Keay, Ltd., Princes Chambers, Corporation Street, Birmingham, is designed to show various types of stanchions and roof principals. Three kinds of supports are shown, and the fencing is specially adaptable for export, as it can be sent away in pieces and put together by unskilled labour. Here is shown also a sample of the patent armoured tubular flooring, with concrete girders reinforced with a corrugated steel bar, light hollow coke breeze tubes, and top layer of concrete. This floor is classified "Full Protection" by the British Fire Prevention Committee, and has the advantage of being practically soundproof. It is very suitable for use in hospitals, schools, workhouses, and public institutions.

BEST AND LLOYD'S ARCHITECTURAL METALWORK.

Messrs. Best and Lloyd, Ltd., gas and electric lighting fittings manufacturers, whose head office is at Cambray Works, Handsworth, Birmingham, and who have London show-rooms at 11, Bartlett's Buildings, Holborn Circus, E.C., have attractive exhibits selected from their high-class gas and electric light fittings. They show also some interesting examples of wrought-iron gate work, cast lead rain-water heads, and other architectural metalwork.

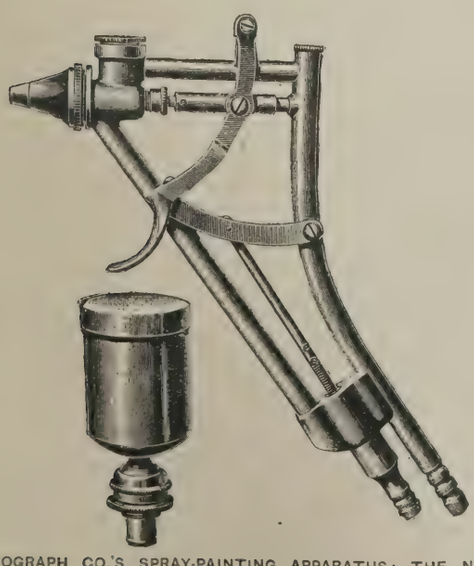
THE BIRMINGHAM GUILD OF HANDICRAFT

show a variety of metal fittings, including those for gas, electric light, and acetylene; door and cabinet furniture, electric radiators, gas stoves, "Guild" enamel letters, etc., etc.

BRITISH CORK ASPHALT, LTD.

This company (of Hammersmith, London, W.), show their patent cork asphalt paving, in various applications, and a selection of photographs of some of the works that have been carried out by the company.

BULLERS' CHINA AND GLASS DOOR FURNITURE.



Messrs. Bullers, Ltd., Tipton, Staffs., exhibit a case giving a selection of their china and glass door furniture, which shows great variety and considerable elegance of design and colouring.

CAKEBREAD, ROBEY AND CO'S DRAIN APPLIANCES.

Messrs. Cakebread, Robey and Co., Stoke Newington, N., exhibit a selection of their drain-cleansing rods, drain tools, drain cleaners, smoke-test machines, drain plugs, etc. Specialities are their patent joints for drain rods, and the standard smoke-test machine, which is made almost entirely of metal, and drain plugs which screw up on small wheels running between the two plates.

WALTER C. CANDY'S SANITARY WARE, ETC.

The following goods are exhibited by Mr. Walter C. Candy, New Street, Birmingham: Roofing tiles, enamelled sinks, pedestal closets, enamelled baths, closet seats, drain-clearing appliances, red and blue ridges, stoneware drain pipes, pedestal lavatory basins, heavy fireclay closets,

THE AEROGRAPH CO.'S SPRAY-PAINTING APPARATUS: THE NOZZLE.

ELECTRIC RADIATOR BY THE BIRMINGHAM GUILD OF HANDICRAFT.

patent closet hinges, flushing cisterns, patent chimney pots, and quarries.

CARRON COMPANY'S RANGES, BATHS, AND CHIMNEYPIECES.

The Carron Company, Carron, Stirlingshire, show their "Palace," "Carrona," and "No. 55" ranges; half a dozen baths and several lavatories; and various chimneypieces and "interiors." Among the last-named are some very attractive copper and brass canopies and fronts.

CURTIS'S AND HARVEY'S GAS MANTLES.

Curtis's and Harvey, Ltd., 3, Gracechurch Street, London, E.C., show their "Ironclad" gas mantles, which are so named because they are fitted with a patent metal top.

DOCKER BROTHERS' VARNISHES AND COLOURS.

Messrs. Docker Brothers, Ltd., Metropolitan Road, Saltley, Birmingham, have designed their stand to represent an Adam drawing-room. The walls are painted and finished with the firm's flat enamel, and the doors have been painted, grained as mahogany, and twice varnished, once with the firm's oak varnish, and once with their special eggshell flatting varnish. Outside, the stand has been finished with white enamel, and the doors are varied suitably for outside work.

GITTINGS, HILLS, AND BOOTHBY'S VARNISHES, ETC.

This firm, whose address is Tower Varnish Works, Long Acre, Birmingham, have a stand in the form of a tower, recalling their trade mark. The panels of the stand are painted with washable distempers in three colours, but otherwise the woodwork is finished with their various specialities in paints, stains, and varnishes.

KIRCHNER AND CO.'S WOODWORKING MACHINERY.

Messrs. Kirchner and Co., 21-25, Tabernacle Street, Finsbury Square, E.C., show a large number of their planing, moulding, and thicknessing machines, a very popular hand-feed planing machine and general woodworker, mortising and tenoning machines, draw-stroke trimmers and mitering machines, saw-benches, band-sawing machines, and an improved grinding and sharpening machine for planing-knives, moulding-irons, etc.

ARTHUR KOPPEL'S TRACKS AND WAGONS.

This firm (of Lombard Street, London, E.C.) show several portable railway track installations of various gauges, portable wrought iron turntables, several tip-wagons, a crane skip, and a locomotive.

MAJOR AND CO.'S "SOLIGNUM."

In order to illustrate an important branch of work for which "Solignum" is used—namely, the treatment of wooden buildings occupied by animals—Messrs. Major and Co., Ltd., Hull, show a loose-box coated with the preparation inside and out. This is, of course, but one of the many classes of work for which "Solignum" is used. It is largely employed for half-timbered work of dwelling houses, etc., and as an artistic stain for interiors.

THE PATENT TIP-UP BATH CO.

This firm, whose address is Broad Street, Birmingham, show the kitchen portion of a small house, illustrating the two best positions for their patent tip-up baths, which are extensively used in cottage property, the space they occupy when out of use being merely vertical, so that they take up very little floor room.

MESSRS. C. A. PETERS' CARBOLINEUM AND OTHER SPECIALITIES.

Messrs. C. A. Peters, Ltd., Derby, and 116, Newgate Street, London, E.C., show their well-known Carbolineum wood preservative; also their portable stoves, for which it is claimed that they give off no smoke or smell, and that they are specially suitable for heating motor houses, etc. These stoves are shown in a specially built wooden pavilion which has been treated with Carbolineum. They have also on view samples of "Sotor," which they recommend as an absolutely reliable means of preserving wood from the ravages of the Teredo navalis; of their "Prism Antioxide," for the prevention of rust; of the "Antioxide" enamel paint, which can now be had in all shades; of the "Carbotron" fuel, which burns without smoke, smell, or dust; and of their rapid cutters and mincers for kitchen use.

RANSOME-VERMEHR MACHINERY CO.'S CONCRETE MIXER.

The Ransome-verMehr Machinery Company, Caxton House, Westminster, exhibit a No. 0 mixer, with charging measuring hopper and automatic water tank, arranged for belt drive. The Ransome Concrete Mixer having been described and illustrated in THE BUILDERS' JOURNAL of May 27, 1908, p. 460, many readers will doubtless be glad to avail themselves of the opportunity afforded by the exhibition to examine the machine itself. A strong recommendation of the mixer is its very conspicuous simplicity of construction. There is no complicated mechanism to get out of order, there is very little gearing, and the machine can be easily and effectively cleaned. It is rapid in action, and eminently efficient as to the product, perfectly mixed concrete of thoroughly uniform quality being turned out at unrivalled speed. The discharge of the concrete being effected during revolution by means of a chute regulated by a simple lever device, no tilting is required; and further economy of time and labour is effected by the addition of a hoist which is controlled by the man who works the discharging chute.

RONEO OFFICE SUPPLIES.

Roneo, Ltd., 17, Martineau Street, Birmingham, display specimens of their well-known duplicators, letter copiers, steel office fitments, stencils, inks, paper, and other office supplies.

RONUK FLOOR TREATMENT.

Ronuk, Ltd., Manchester, Portslade, and London, demonstrate their sanitary method of treating floors, by which the pores of the wood are filled up, and a hard, bright, and durable surface is formed, in which germs find no harbouring, while the surface thus formed is easily cleansed. The firm make a specialty of the first preparation and polishing of all kinds of flooring, and have carried out many important Government and municipal contracts.

THE SAXON PORTLAND CEMENT CO.

The Saxon Portland Cement Co., Ltd., Cambridge, show cement of their well-known brand in various states, from the raw material to the finished product. Next to the raw material as taken from the quarry, is shown the mixed chalk marl. Then, in succession, are shown the following; the impalpable "flour," prepared for combination in correct chemical proportions in special mixers; ground marl ready for burning; the ground marl pressed into blocks for convenience of loading into the kilns; block ready for kiln; block after grinding and mixing to the standard chemical composition ready for burning; the various kinds of clinker obtained after burning in rotary and in continuous kilns respectively; the same after the first stage of crushing and grinding; and, finally, a sample of the finished product. This affords testimony of the extraordinary pains taken to produce a cement of sterling value.

SEYSSEL ASPHALTE, ETC.

The Seyssel and Metallic Lava Asphalte Company, 42, Poultry, E.C., exhibit at stall No. 1, Row M, samples of Seyssel asphalte and metallic lava asphalte. Sevssel asphalte is used for roofs and other exposed positions, the metallic lava asphalte being for damp-courses and basement floors. The stall is paved with a piece of Seyssel asphalte laid in two coats, together 1in. thick, and samples of the material are obtainable on application. A new booklet prepared specially for this exhibition includes some 30 illustrations of various important contracts carried out by the firm, including Liverpool Dock offices, Windsor Castle, Metropolitan Water Board reservoirs, St. Bartholomew's Hospital, and many others.

SMITH POWERS AND CO.'S PAINT AND TEREBINE.

Messrs. Smith Powers and Co., Priory Varnish Works, Coventry, show samples of their Titanic Paint, "Priorite," and Powers' Original Terebine.

WALKER AND WORSEY'S SAFES, DOORS, ETC.

Messrs. Walker and Worsey, Edmund Street, Birmingham, makers of bent steel safes, strong-room doors, etc., show, besides specimens of their special twelve-corner bent steel safe, some steel strong-room doors, locks and latches, panic bolts, and other door furniture and fittings, as well as a safety cleaning casement window, sash and casement fasteners, stays, etc.

WOOLLISCROFT AND SON'S FIREPLACES, TILES, AND FAIENCE.

Messrs. Geo. Woolliscroft and Son, Ltd., of Hanley, Staffordshire, display samples of their modern fireplaces, tiles for the building and cabinet trades, terra-cotta, and faience. Two of the fireplaces are fitted with a patent "downdraught" fire, which is on the floor level, and for which it is claimed that it effects complete combustion of the fuel, and gives the capacity to burn anthracite, the fire needing no attention after first lighting. Another fire displayed is the "Glow," which is especially chosen for its capacity to retain the heat from the fire, and to radiate it equably and slowly into the room. Some of the fireplaces are built of faience, others having surrounds of slabbed tiles, with majolica or opaque glazes in beautiful shades. The designs are also varied, one mottled white and green, being remarkable for its tile canopy, another for its double arch. The dadoes show variety of style and richness of colouring. The specimens of tiling for floors show patterns suitable for both private and public buildings, and the tile tops for restaurants, and tops and backs for wash tables are another interesting feature of Messrs. Woolliscroft's attractive stand.

SCOTTISH FEDERATION ORGANISATION.*

Inadequate Organisation.

At the present time, the Federation as presently constituted is not the force it should be. The building trade is the second largest source of employment in the United Kigdom, but the employers have hardly realised the value of combination for the protection of their trade interests. It is quite different with the operatives. It is quite evident that trades-unionism is becoming a greater force than ever. The socialistic and labour men are well represented on municipal bodies, and in Parliament they have more than fifty members.

The Operatives' Example.

Mr. G. N. Barnes, M.P., for the Blackfriars and Hutchesontown Division, Glasgow, addressing a meeting of the Scottish Horse and Motormen's Association in Glasgow on 16th August last said: —"In these days of producing for profit, it was necessary that trades unions should have trained men to make bargains for them and to apply all their pressure upon Parliamentary and municipal authorities. Trades unionism had improved the conditions of men, had raised wages and shortened the hours of labour, but it was necessary they should adapt themselves to the altered and changing conditions of industry, so that, instead of having small units of departmental and specialised branches of trades, they should have one strong organisation embracing all." Surely in these words there is a warning note to employers. If the men in their hundreds of thousands recognise that it is to their interest to have one strong organisation embracing all trades, rather than "small units of departmental and specialised branches of trades," then the operatives will be placed in a very strong position indeed.

Need for Closer Union.

But what is your position? I do not say do away with all your individual associations and federations. What I do advocate, however, is a bringing more closely together all these associations and federations into one large federation, on the executive of which each individual association would be directly represented, and the affairs of each individual association would be freely vented and considered by that general executive. At the present time we have only 13 associations in all Scotland, in the Scottish Federation, and of these thirteen associations, seven are in a very depressed state. Dull trade may have something to do with this depressing state of affairs, as regards those seven centres, but the other federated associations are affected as well, and might have gone to the wall but for the fact that in their membership they have men who are prepared to carry on the association work, and to keep their membership together so far as possible. A few good men interested in their association, and alive to the claims of their trade could keep an association together until the tide turned and trade improved a bit.

Scheme of Organization.

In order that the Federation may do greater and better work than it has ever before attempted, it must be properly organised. As it is just now, having only two meetings in the year, little real good work was done, and there is not, in my opinion, that close relationship between the members which should exist in all well-governed bodies. I would suggest that the Federation be divided up into centres, and I have allocated the districts as follows:—Inverness to include the Counties of Inverness, Ross and Cromarty, Nairn and Elgin; Aberdeen to include the counties of Aberdeen, Banff, and Kincardine; Dundee to include the counties of Forfar, Perth, and east Fife; Edinburgh to include the counties of Mid-Lothian, Haddington, Peebles and Linlithgow; Alloa to include the counties of Clackmannan, Stirling, Kinross, and East Fife (West of Burntisland); Hawick to include the counties of Roxburgh, Selkirk and Berwick; Paisley to include the counties of Renfrew, Dumbarton and Lanark; Kilmarnock to include the counties of Ayr and Wigtown; Dumfries to include the counties of Dumfries and Kirkcudbright; Oban to include Argyllshire. The secretary of the Association in the town responsible for one particular district would act as secretary of this smaller or County Federation, whose headquarters would be in that town; and the executive of the local association would require to undertake some work by way of deputations and so on, to endeavour to stir up interest in their immediate surrounding district and start associations if practicable.

Pay the Secretary.

Of course this would necessarily mean considerably more work for the secretary, involving a good deal of his time and no man could expect such work to be performed gratuitously. The labourer is worthy of his hire, and better work would be got from a paid secretary than from an honorary one, because a paid official is expected to do his work thoroughly and well, and if he does not, then you have your remedy. But with a secretary who works without any remuneration, you can neither expect the same amount of work done nor the same interest to be taken. Moreover, you could not question the work done by an honorary secretary, because it is all done gratuitously. At the same time, we must not disparage the work done by men who undertake secretarial duties gratuitously. Much good work is done by such men; but if they were paid for their services even better work would be forthcoming. Therefore, I say, pay your secretary, and pay him well, for the bulk of the work will fall on him.

The Money Question.

Where is the money to come from to pay the Secretary? Pay him out of your association funds, or from the funds of the Federation. At present, 2s. per member per annum is paid by each association into the Federation funds. That is a mere bagatelle compared to what the operatives pay into their unions. An extra shilling per member per annum would be sufficient to begin an aggressive work fund, and this could be augmented from time to time by voluntaty contributions, or otherwise. As time went on, and it was found that several new associations had been started, that would open up a source of revenue from which ordinary expenses could be paid.

Appointment of Delegates.

Each Association in one particular district would appoint delegates from its membership to act on the general county executive committee, which would be made up of an equal number of delegates from all the associations in that district. This executive committee would meet monthly, or quarterly, in the different towns in its own district to transact any business. Reports would be sent in periodically to the headquarters of the Scottish Federation, giving an account of all that was being done, and thus the whole Federation would be kept informed of the progress being made. In turn, each County Federation would appoint delegates and representatives to the Scottish Federation, who would meet half-yearly at at present, in different centres. The executive committee of the Scottish Federation would meet oftener, however, as occasion required. In this connection it might be a wise move to hold the next half-yearly meeting in one of the towns where the local association is in low water. This might result in stimulating interest there.

Formation of Centres.

The advantages of dividing up the country into centres or districts must be apparent to everyone. For instance, members of an association in one county know more about the building trade in an adjoining county than men in Edinburgh, for example, know about the building trade in Inverness. Hence, in this work of organisation the local men will know where to start right away. Then, again, many small matters of detail could be settled by a local branch of the Federation without consulting the parent body. As it is just now, each association appeals to headquarters on all matters, whether of great or small importance, because they have no alternative; but with a local branch of the Federation duly constituted, much time and trouble would be saved by having local matters dealt with by that branch Federation.

Then, over and above all, by having district or county Federations set up, governed by a central body—namely, the general executive of the Scottish Federation—the different centres are brought closer into touch with each other, with the result that more interest is taken in Federation matters generally, and all matters of business are more expeditiously gone about because the men concerned are on the ground, so to speak, and can have meetings, etc., at very short notice.

Glasgow Stands Aloof.

It is unfortunate that at this time, when organisation is being thought of, Glasgow is still outside the Federation. There can be no complete scheme of organisation without Glasgow, who seem to have considerable hesitation in declaring for Federation. I have done my best, both by correspondence and personal call, to induce the Glasgow Associations to rejoin the Federation, but the prospects are not encouraging. Why Glasgow stands aloof I do not know. Sooner or later they will require to stand closer together than they are doing, if they are to maintain their position as employers in the building trade. Organisation will alone safeguard their interests, and they should now come forward and take a share in the work of organisation of the Federation.

Apathy the Enemy.

If the scheme I have shortly outlined is to be at all a success, then it must receive the local support and earnest work of the members in the building trade themselves. It is not sufficient for a man to pay his guinea or half a guinea, as the case may be, and say, "That is my annual subscription," and do no more. Something more than that is needed. We cannot get on without money, certainly, but what is of far more benefit is

**Summary of a paper read at the annual meeting of the Scottish Building Trades' Federation, by the Secretary, Mr. James Cameron.*

a keen interest taken by the members themselves in the work of their association. The secretary feels encouraged and cheered when he gets a large meeting in response to his notices. How many times have meetings been called where a quorum did not turn up and no business could be done in consequence! That, I fully believe, is the experience of every secretary connected with this Federation. That should not be. It has a demoralising effect on the association as a whole. Those who turn up to the meeting and see no busines done begin to lose interest themselves, and when the next meeting is called they say, "Well, we got nothing done at the last meeting, and I do not feel inclined to waste my time going to any more meetings." Let it be a principle of every man, then, to attend the meetings he is summoned to, where at all possible.

Support the Secretary.

In conclusion, I make a final appeal to employers to bestir themselves and help by every means in their power to strengthen the Federation. An opportunity is given now, and if you will rally round your secretaries and encourage them in the work of organisation, much good, I believe, will be the outcome. But there must be real earnest work done. Make your secretary feel that you are at his back and will support and advise him whenever possible. Take a hand in the work, and you will find that your secretary will go into it with a right good will, and, notwithstanding the depressed state of trade throughout Scotland at the present time, I believe that if the seeds of closer federation are sown now, we shall reap the harvest in due season.

Messrs. J. E. Clegg and Son's Heap Riding Mills, Stockport, which were recently destroyed by fire, have been reconstructed under the supervision of Mr. Henry Stead, architect, of Heckmondwike, the constructional steelwork, fire-resisting floors and asphalte flat roofs throughout being carried out by Messrs. Homan and Rodgers, Manchester.

* * *

Bradford City Council have decided to fill the vacancy of City Architect, caused by the resignation of Mr. F. E. P. Edwards, by advertising. The appointment, however, is to be left in abeyance for the present, and work will, meantime, be given to architects in the city.

* * *

The following is a list of officers elected for the Halifax Architecture Society, for the coming year:—President, Mr. C. J. Fox, F.S.I.; vice-president, Mr. Graham Nicholas, F.R.I.B.A.; secretary, Mr. C. E. Fox; treasurer, Mr. J. J. Glendinning; Council, Messrs. T. Kershaw, W. E. Horsfall, L. Coates, Jesse Horsfall (Todmorden), E. C. Brooke (Brighouse).

* * *

Mr. Walter J. Pearce, we are informed, has now acquired the sole interest in the high-class decorative business which for eleven years he carried on as managing director. Mr. Pearce, besides being an experienced decorator and colourist, is a practical craftsman; and in his announcement that his business will be consolidated under his personal supervision at 41, Gartside Street, Manchester, he states that "the strictest privacy and reserve are shown in dealing with the special ideas and designs of architects, and with all business undertaken for builders, decorators, or other contractors."

Market Reports.

Iron and Steel Trades.

In our last report we pointed out the dangers of prophesying, and the extreme uncertainty of the position at that time. Since then the market has made a slight but sudden movement in the direction of better prices and more business. Better, however, is not at all the same thing as good, and conditions are still far from satisfactory. The pleasing factors are, the termination of the engineering strike, and the consequent resumption of work by our shipbuilders on the North East coast. According to latest advices, however, these firms have in the aggregate only sufficient orders on their books to keep them working at 25 per cent. of their maximum output. In the Clyde district, some of the largest yards in the neighbourhood of Glasgow are practically idle, but quite a substantial amount of contracts were booked last month, so that the winter prospects are, on the whole, encouraging. The total output of the Clyde shipbuilding yards for the first nine months of this year has been little more than 50 per cent. of the output during the corresponding period of 1907. The other staple product of British steel manufacturers—namely, rails—also shows some tendency to improve. There is quite a large contract in the market for a Chinese railway under German management, the quantity involved being nearly 78,000 tons of rails and accessories, while there is quite a respectable tonnage of bridgework for the same concern. The latter, however, is not likely to fall to British engineers.

That the market generally is undoubtedly stronger as further evinced by the fact that many of the dealers are booking contracts for forward delivery. Girder merchants are again buying German joists for stock, and the German syndicate is very chary about making contracts for next year's delivery. When all is said and done, however, extremely low prices are still ruling for immediate specifications, and it would be unsafe to say that, so far as the immediate future and present are concerned, manufacturers are any better off than they were a few weeks ago. In Germany, in particular, there cannot be said to be any better demand; any improvement in prices is merely a reflex of the slight though real improvement in this country.

The Portland Cement Trade.

There is but little of interest to report this month respecting the Portland cement trade. There appears to be but little, if any, improvement in the demand, but there is no further falling away in prices, which, as stated in our last report, have reached an extremely low level. It is understood that the new fuel contracts have not yet been settled. There will certainly have to be a substantial reduction in fuel prices if manufacturers are to secure even a small profit on their sales of cement. The building trades continue slack, but there are undoubtedly signs of increased activity in large constructional works, while there is evidence of still further improvement in this department materialising in the near future. Such large works as Rosyth—the Admiralty specifications for which are to be distributed this month—will require huge quantities of cement; and although this work will probably not be commenced for some months yet, other somewhat smaller works, such as the new docks at Southampton, Portsmouth, and Methil, and the Doved Harbour extensions, will be calling for considerable quantities of cement all through the coming winter. The export market for cement shows no improvement, and the tonnages recently exported show a large falling off as compared with corresponding months of last year. Here again, however, there are indications of a revival, and it would not be altogether surprising if these materialised into real activity at a comparatively early date. In every direction abroad, the use of reinforced concrete for almost every kind of constructional work is developing at a rapid pace; and although the new method is making slow progress in the United Kingdom, it is satisfactory to note the growing interest that has been aroused not only among the professional classes, but among municipal corporations, railway companies, and other large corporations. With the removal of the Local Government Board restrictions, to which reference has constantly been made, and with the overhauling of the London building by-laws, which is almost certain to take place at an early date, we shall beyond all question see an almost universal adoption in this country of the great twentieth-century building material. When this comes to pass, cement-makers will find for cement a new outlet which is very badly needed.

The South Staffordshire Brick Trade.

About 90 years ago a splendid strata of clay was discovered in the West Bromwich district of Staffordshire, and contiguous localities. This clay was found to be peculiarly adapted for the production of all kinds of blue bricks, copings, stable bricks and paving bricks. It had an unrivalled run of success, for the bricks got specified for all kinds of public works, such as gas and waterworks, sewerage works, canals and railways, and the paving bricks became most popular. Engineers and surveyors found them adapted for bridges, viaducts, and tunnels, possessing in a marked degree strength and durability. For many years they stood their ground and held pre-eminence. Eventually there was such a demand that when the Great Central Railway and other railway extensions were in full swing, the old South Staffordshire makers could hardly supply in necessary quantities, and in the specified times. This resulted in many capitalists embarking on the manufacture of blue and brindled bricks. Various new companies were floated, and in their eagerness to make money, all sorts of clay beds were improvised, and all kinds of spurious blue bricks produced and put on the market at prices which the old and renowned makers could not compete with; these wares got foisted on the market as real Staffordshire Blues, but in process of time engineers found they were not up to the mark, and they began to reject them. The older makers to some extent reduced their prices as the innovators, not having incurred the same expense in manufacture, and being minus the good clay, had injured the trade. Original makers of Blues had to fight the competition, and rather than be cut out, and their old association disintegrated, they began, unfortunately, to cut down the prices, and this ended in many firms having to stop; something like half-a-dozen of the best and oldest firms eventually succumbed, through keeping up their standard at the same or even greater cost of making; for coal slack and other fuel and necessaries advanced seriously in price. Various attempts were made by some makers to re-combine, and to fix minimum prices, but the number of interlopers and their methods of business operated so keenly that the attempts to fix a ruling price failed, and so this ancient and once highly prosperous industry is demoralised. Now the atmosphere is beginning to clear, many of the speculators having come to grief. The effect of their policy and practices of course made an impression on others, and it became a question of the survival of the fittest. Some of the wiser heads have devised patent kilns and adopted other devices affecting cost of production, and these economies will enable them to surmount the crisis.

It is lamentable to record the closing of such an old-established blue brick works as Peter Wood, Ltd., Pump House Brick Works, West Bromwich, started 76 years ago; also the Tibbington Brick Co., Prince's End, Tipton; the Bloomfield Brick Co., and others, at Oldbury; several are in the hands of Official Receivers. Messrs. Hall and Boardman, of Swadlincote, built a brick works at Tipton, near Peter Wood's, about eight years ago, at a cost of £14,000 or more. This is now closed, and when put up for sale, only one offer was made, and that of £2,600. Other works have heavy bank charges and mortgages on them. Over-production, inexperience, and reckless working are the causes of the present deplorable position of South Staffordshire blue brick trade. This is not a case of foreign dumping for hardly any bricks of this special kind are imported. The railways, besides being good customers, have for some time past shown great consideration to the brick masters, and as a rule arrange with alacrity special rates for large lots. Time was when all the masters used to issue printed price lists. This was when they had a strong association. Now prices are quoted according to circumstances, and according to quantities. Still, there are a lot of big schemes in prospect requiring in the near future large numbers of good blues and brindles

Ruling prices at the works are:—			
Common blue wire cuts ... per	1,000	30	0
Best pressed blues	,,	45	0
Best stable bricks	,,	50	
Best blue paving, chequered and plain, 10in. by 5in. by 2in.	,,	42	6

Red Brick Trade of the Midlands.

The erection of dwelling-houses throughout the Birmingham and Midland district went on at such an unprecedented speed for something like 10 years that the brick trade was on the up-grade; but the speculative builders over-stepped the needs of the people, and now all the trades are suffering from dire depression. Workpeople cannot afford to marry, and those already married are in most instances compelled to meet the pinch by letting part of their houses to others. Then many of the iron-workers in the Midlands, through the transfer of large iron works to the sea coast, have migrated.

Besides the places enumerated, many works, and consequently the workers, have gone to Cardiff and many other South Wales towns, where coal is cheap and close at hand, and the shipping ports equally handy, and in many towns municipal rates are lower than in Birmingham, Wolverhampton, Walsall, Dudley, etc. The South Staffordshire district does not rank high for best red facing bricks; these are, however, produced in the Stourbridge district, and none better, but it is somewhat strange that for best reds architects specify largely for Ruabon and Accrington make, though carriage is greater. South Staffordshire makers turn out large quantities of common reds, largely used for ordinary houses in outlying streets, and many millions of such are used for inside walls, cellars, foundations, and in the erection of schools, libraries, and works. With the increase of trade, when it comes, house-building should regain some of its former briskness, and speculators will find the prices down to the lowest ebb they have reached for 15 or 20 years past. The manufacture of red bricks is even now very extensive, as there is a large number of yards going at Dudley, Blackheath, Bloxwich, Leanore, Walsall, Wednesbury, Wolverhampton, Aldridge, Erdington, and Birmingham, and in Warwickshire, and Leicestershire best and common reds are largely made, but prices are cut low.

Current Market Rates of Materials in the Various Trades.

The quotations given in this list apply only to larger quantities purchased in London (the minimum quantity for which these prices are applicable being given where practicable). Retail purchasers must expect to pay a reasonable advance on wholesale rates, as well as carriage. The trade discounts for each item have not been considered, as these would be affected by the quantity of the goods purchased. The endeavour is made to give fair average prices, which would in many cases be affected by the quality of the materials required.

BRICKLAYER.

The current rates for stocks, Flettons, and other common building bricks, and for local facings are not given, as local considerations obviously affect their prices, and readers who may make use of the information given in these columns can readily obtain quotations for themselves.

REAVELL, ALF. HY., builder, 37, Peascod Street, Windsor, and St. Faith, New Road, Clewer. R.O., Sept. 21. Adj. same day.

Partnerships Dissolved.

JOB JARMAN and WILLIAM DAWS, carrying on business as builders, contractors and decorators, at 3, Eton Street, Richmond, Surrey, under the style of "Jarman, Daws and Co.," has been dissolved, Sept. 7.

WALTER ROBINSHAW, DANIEL HOWARD DALTON, WILL HARRY TATTERSALL, and JOHN WILLIAM FLETCHER, carrying on business as builders, at Rochdale, under the style of the Spotland Equitable Land and Building Syndicate, has been dissolved, so far only as regards the said Daniel Howard Dalton, Sept. 10.

Coming Events.

Monday, October 12, to Wednesday, October 21.
MIDLAND COUNTIES BUILDING TRADES EXHIBITION, Bingley Hall, Birmingham.

Thursday, October 15.
SOCIETY OF ARCHITECTS.—Annual General Meeting, 8 p.m.

Thursday, October 15, and Friday, October 16.
ROYAL INSTITUTE OF BRITISH ARCHITECTS. — Examination for District and Building Surveyors. (Applications not later than October 1.)

Friday, October 16.
INSTITUTION OF MECHANICAL ENGINEERS.—Paper by Mr. J. E. Darbishire, on "Repairs, Renewals, Deterioration, and Depreciation of Workshop Plant and Machinery," 8 p.m.

ROBERT ADAMS' NEW INVENTION.

IMPORTANT TO ARCHITECTS & BUILDERS.

REVOLUTION in Silent Door Spring Hinges.
A New and Wonderful Floor Spring for Double and Single Action Doors.
Absolutely the Shallowest, Most Perfect, Powerful and Efficient Spring ever invented.
Half the size, Thrice the Value and Durability of others.
Its unique Sealed Check Chamber is Impervious to Water, and an immunity against oil-stained floors.
It is calculated to increase the demand for double and single action Door Springs, even more than my original celebrated and now Universally used 1870 patent Spring and Adjustable Shoe.
Such a Shallow Box as referred to above has never before been known to be practicable. It has been specially designed for the shallowest floors, to suit the exigencies of modern construction.
Robert Adams' other Specialities include New Patterns in Fanlight and other Opening Gearing, Panic Bolts, Weather and Water Bars, &c., &c.
Particulars on application to the Patentee:

ROBERT ADAMS, 3 & 5, Emerald Street, Bedford Row, London, W.C.

15 GOLD MEDALS AWARDED.

POINTS FROM THE MONTHLY REPORTS.

In the monthly report of the National Federation of Building Trades Employers, relations with the operatives of Rochdale, Leicester, and Swansea are noticed. The Federation's representations to the Home Secretary as to amending the Sweated Industries Bill so that it should not apply to industries in which employers and employed had agreed to working rules, seem to have been effectual, as the summary of conclusions (forwarded to us for reproduction, but omitted from want of space) of the Select Committee on the Bill, shows that it will not affect the building trade. An interesting agenda for the Annual Conference of Secretaries, on October 20th, has been prepared.

The Lancashire, Cheshire, and North Wales Federation has passed a resolution urging the National Federation to represent to the Board of Trade the practical impossibility of filling up accurately the returns required by the Census of Production Act. With respect to the memorandum from the Board of Trade, on the proposed Court of Arbitration, the Federation approved of the principle, but thought that the scheme would probably meet with greater success if the proposed courts consisted of members of the trade affected.

The Scottish Building Trades Federation, at its annual meeting, held on September 18th, in Aberdeen, appointed a deputation to wait on the Home Secretary to submit certain amendments to the proposed scaffolding regulations.

The good work that is being done by the Local Conciliation Boards was affirmed at the monthly meeting of the executive council of the Yorkshire Federation. From Bradford, Dewsbury, Huddersfield, Leeds, Morley, Sheffield, and Wakefield, there was a consensus of opinion that the Boards are very valuable, and are "conducive to the maintenance of cordial relations with the operatives." The expediency of giving notice for a general reduction of wages having been mooted, it was found that the local associations of the Yorkshire Federation are in agreement that it is not advisable at the present time to give notice for a general reduction, and the Northern Centre was to be notified to this effect. With respect to the introduction of the National Form of Contract to local authorities, it was agreed to recommend local associations to seek an interview (by deputation) with the local surveyor or similar official, in order to ascertain his views on the subject before submitting the form of contract to the local authority. It was agreed to request the Northern Centre and certain local associations to report upon the expediency of admitting the National Association of Builders' Labourers as parties to the Local Conciliation Boards. Opinions of the local associations on certain points with respect to the Board of Trade's proposed Court of Arbitration are to be invited. The next meeting of the Federation, and conference of association secretaries, is to be held at Leeds, on Thursday, October 22nd.

The Northern Counties Federation, at their quarterly meeting held at Sunderland on September 29th, discussed two important questions on which the Federation is at issue with the Education Building Committee of Durham County Council—namely, with respect to independent arbitration in disputes, and to the bill of quantities forming part of the contract. It was resolved to send a deputation to the Durham County Council; and, in case a modification of the Council's conditions were refused, the members pledged themselves to refuse to tender.

The Oldham Association is resisting an amended fair contracts clause that has been submitted to the Oldham Corporation by the Oldham Trades and Labour Council. The clause demands liberty of workpeople to fulfil the usual conditions of membership, such as paying or collecting subscriptions at any place or time required by the workpeople, provided that the duties of workmen are not thereby interfered with; seeks to make the principal contractor and the council responsible for the observance by sub-contractors of the specified conditions; requires the council to communicate to the workmen's organisation the names of successful contractors at least seven days before the contract is sealed; and demands that failure on the part of the contractors to comply with any of the conditions shall leave the council power to cancel the contract or call upon defaulting contractors to pay to the council any sum not exceeding £500, from which sum workmen shall be compensated for any loss which it may be proved they have suffered by the breach.

Extraordinary mortality among the members is reported by the South Shields Association, which has lost four members within three months.

Manchester and Salford starting and stopping times for operatives in all trades are, if possible, to be made uniform; the association is working with that object.

The Wakefield Association reports an earnest but apparently inconclusive discussion on the desirability of including in quantities an item to cover insurance against risks under the Workmen's Compensation Act, and on the general liability of "undertakers" under the Act. Details of the discussion are not reported.

A modification of the "notice rule" is reported from Rochdale as having been agreed upon by the National Board of Conciliation. It is to the effect that while men employed in workshops will give or receive one hour's notice, or wages in lieu, those employed on outside jobs will give or receive 2 hours' notice or wages.

The fair-wages clause in the corporation form of contract has occupied much of the attention of the Bristol Association, and the form evolved after much deliberation, and with the valuable assistance of Mr. A. G. White, the National secretary, is included in this month's report from the Bristol Association.

MONTHLY OFFICIAL REPORTS.

THE NATIONAL FEDERATION

Relations with the Operatives.

Rochdale.—The carpenters and joiners demanded 1d. per hour advance of wages, and a consequential alteration of the overtime rule, also an alteration of the notice to terminate engagement rule. The employers sent a proposed code of rules by way of counter-notice. The case went from the local board to the Northern Centre Board, and was by it referred back for further consideration, but without result. It was reconsidered by the Northern Centre Board on September 14th, and no decision was arrived at. An appeal to the National Board resulted in no decision as to the first two items. A decision as to the third item was given.

Leicester.—The Board of Trade "Gazette" reports that on September 8th a joint application was made to the Board of Trade for the appointment of a mediator to consider a dispute between the Leicester and District B.T.E. Association and the United Committee of Operative Bricklayers', Joiners' and Builders' Labourers of Leicester District, as to an alleged violation of the working rules relating to walking time and payment of standard rates of wages to builders' labourers. On September 14th the Board of Trade appointed Mr. T. Smith, J.P., of Leicester, to act as mediator in this dispute.

Swansea.—The joiners have given notice for an advance in wages and alteration of rules. The masters have given the operative plasterers notice for an alteration of rules.

Sweated Industries' Bill.

During last session of Parliament, the above Bill was referred to the Select Committee of the House of Commons on Home Work for consideration and report, and a representation was made on behalf of this Federation to the Home Secretary as to the desirability of amending the Bill so that its provisions should not apply to industries wherein the employers and employed, acting through their representatives, had entered into agreements for working rules dealing with wages and hours of labour.

Kindred Associations in Australia

On September 14th the secretary had a call from Mr. R. S. Walpole, secretary of the Victorian Employers' Federation, Melbourne, and secretary of the Central Council of Employers of Australia, a body analogous to the Employers' Parliamentary Council here. Mr. Walpole wished to convey to this Federation the good wishes of his Council, and to say that in dealing with the numerous experiments in labour legislation which are being tried in Australia, certain experiences had been acquired which might prove very useful in the near future to English employers of labour; if there was any information they had which was of utility to us in countering attacks, it was always heartily at our service.

Administrative Committee.

A meeting of the Administrative Committee was held on October 13th, at which were considered the various resolutions on the extension of the use of the National Form of Contract, as to the N.A.O.P. Agreement, as to the Building Operations and Engineering Works Bill, and as to a Builders' Foremen's Benefit Society, remitted from the half-yearly General Meeting. A meeting of the Journal Committee was also held, to report progress.

Organisation.

In spite of the deterrent influence of the prolonged spell of bad trade, it is most important that efforts to secure new members and revive or inaugurate local associations in districts where they are at present lacking should be steadily persisted in, and the position of all parts of the Federation at least maintained. A circular letter, therefore, has been sent out to the Federations, advising them that the National secretary is available to address organisation meetings anywhere, and will be glad to render assistance in extending the membership.

Conference of Secretaries.

The Annual Conference of Secretaries will be held in London on October 20th. On August 7th last, a preliminary circular was sent to the Federation notifying the above date, and inviting suggestions for the agenda or promises of papers by September 1st, and conveying the resolution of the Executive Committee, requesting the local associations to authorise their secretaries to attend. The two conferences that have been already held have proved so valuable and stimulating from the point of view of organisation, that it is earnestly hoped that the above recommendation of the Executive Committee will evoke a hearty response from every local association, and that a representative attendance will result. Without this direct action on the part of local associations, only the most active and energetic secretaries attend the conference, while the secretaries of the weaker associations, who most need stirring up and educating in regard to organisation, fail to put in an appearance, largely because there is no authority given them, and if they came it would be at their own expense. At the same time, secretaries who are anxious to improve their position and the standing of their association should not let any niggardliness on the part of their committee keep them away from a gathering where they will assuredly learn much which may be to their ultimate advantage if they rightly apply what they learn.

The following notice and agenda have been sent to all Local Associations through the County Federation secretaries:—

October 10th, 1908.

Dear Sir,

Conference of Secretaries.

I beg to advise you that the Annual Conference of Secretaries held under the auspices of the National Federation, will take place at the above address (31, and 32, Bedford Street, Strand, W.C.), on Tuesday, October 20th, 1908. The chair will be taken by E. J. Brown, Esq., Senior Vice-President of the Federation, at 11 a.m.

There will be a recess at 1 p.m. for lunch. At 2 p.m. the Conference will resume, and is expected to conclude its business about 4 to 4.30 p.m.

Your attendance is earnestly desired.

Yours faithfully,

A. G. WHITE,
Secretary.

Agenda.

1. Opening address by E. J. Brown, Esq., Senior Vice-President of the Federation. 2. Discussion of proposed model rules for a local association, adjourned from 1907 conference, and any resolutions arising. 3. The Official Journal: What is the best method of obtaining general support for it? (Suggested by the Committee of the Lancashire, Cheshire, and North Wales Federation). 4. A few observations upon the law of a builder's contract, by Mr. W. H. Hope, secretary of the Sunderland M.B.A. and the Northern Counties Federation. 5. Local Association management: (a) Paper by Mr. B. B. Moss, secretary of the Liverpool M.B.A., the St. Helens M.B.A., the Warrington M.B.A., and the Mersey Building Trades Employers' Federation, entitled, "Organising Generally." (b) Paper by Mr. Thos Smith, secretary of the Sheffield M.B.A., entitled: "Some Pointers on Association Building." (c) Paper by Mr. R. Hall, secretary of the Bury M.B.A., entitled "Some criticisms on association finance, with special reference to the financial proposals contained in some of the papers submitted to the 1907 Conference." 6. Two short papers by the National Secretary: (a) Federation Benefits; a companion paper to that given last year on Association Benefits. (b) Tenders and the information on which they are based.

Yorkshire Federation Conference of Secretaries.

A Conference of Secretaries of the Yorkshire Federation has been arranged for October 22nd, and the National secretary has promised to attend and address the meeting.

THE NORTHERN CENTRE OF THE NATIONAL FEDERATION.

COMPOSED OF

The Lancashire, Cheshire and North Wales Federation, The Yorkshire Federation, and The Northern Counties Federation.

Secretary: JAMES DENVER, Cromwell Buildings, Blackfriars Street, Manchester.

The quarterly meeting of the Executive Council of the Northern Centre of the National Federation was held at the Grand Central Hotel, Briggate, Leeds, on Monday, October 5th, when the president (Mr. Henry Matthews, J.P., Manchester) presided over a good attendance of representatives from the three Federations.

The secretary was authorised to attend the Annual Conference of secretaries to be held in London on October 20th.

Replies were read from the three Federations forming the Centre with reference to the working of the conciliation scheme, and as the experience of each seemed to differ very much, a sub-committee was appointed to consider the matter and report to a further meeting.

The question of the admission of the Labourers' Union into the conciliation scheme was considered at some length, and correspondence was read from the Federations, when ultimately a resolution was passed thereon

Mr. J. B. Johnson, of Liverpool, was elected to represent the centre on the Committee appointed by the National Federation to consider the question of amending the N.A.O.P. agreement.

NORTHERN CENTRE CONCILIATION BOARD FOR THE BUILDING TRADES.

A special meeting of the above Board was held at the Grand Central Hotel, Briggate, Leeds, on September 14th, at 2.30 p.m., when Mr. T. Wilkinson, Middlesbrough, took the chair, and Mr. D. Richards, J.P., Southport (operative), took the vice-chair. Mr. James Denver, Manchester, was appointed secretary for the employers' section of the Board, in place of Mr. John Tomlison, resigned. Some correspondence was read from the Liverpool Association, having reference to a complaint which had arisen under the St. Helens boundary radius, arranged by this Board a short time ago, and after some discussion a resolution was passed thereon. The appeal from the Rochdale Local Board for an advance in joiners' wages of 1d. per hour—from 9d. to 10d.—together with a proposed alteration in the overtime rule and the extension of the discharge notice from one hour to two hours, referred back from the meeting held on June 29th last, was again down for consideration, and representatives were admitted to state their case. The evidence from both sides having been heard, several votes were taken on each of the points in dispute, but no decision could be arrived at, both sides voting equal on each occasion, so that the matter will go before the National Board acording to rule. Some discussion then took place on the use of these Boards from both sides, and the meting terminated.

THE LANCASHIRE, CHESHIRE AND NORTH WALES FEDERATION.

Secretary: JOHN TOMLISON, Cromwell Buildings, Blackfriars Street, Manchester.

The Organising Sub-Committee of the Lancashire, Cheshire and North Wales Federation met in Manchester on Friday, September 11th, to decide on their plan of campaign for the winter in the unaffiliated districts, where it is intended to make special efforts to form branches.

The Administrative Committee met on September 11th, when several important matters affecting the district were considered, including the publication of the Official Year Book; the appointment of a committee to meet the operative joiners' executive respecting the construction to be put upon the conciliation rules, with a view to bringing about a settlement with the joiners at Altrincham; and the question of the admittance of the labourers' union into the conciliation scheme.

Some discussion also took place at this meeting with regard to the returns required by the Census of Production Act, it being claimed that it was practically impossible for employers to fill up the same accurately; and a resolution was passed urging the National Federation to bring the question of amending the form in future, to the notice of the Board of Trade through the Employers' Parliamentary Council.

A communication was read from the President of the Building Contractors' Association of Paris asking for information respecting employers' organisation in this district, and the secretary was instructed to supply the same.

Meetings have been held of the slaters' and plasterers' branch trade committees to consider relations with the operatives.

The slaters also have under consideration the question of the unfair competition of wholesale slate merchants with master slaters, and the committee who recently had this matter in hand were re-appointed to deal further with the same.

The plasterers had under consideration at their meeting the question of "ending or mending" the N.A.O.P. agreement, and a resolution was passed thereon.

The quarterly meeting of the Executive Board was held at the King's Arms Hotel, Lancaster, on Monday, September 28th, when Mr. William Bullen, Liverpool (the president) presided over a fairly large attendance of representatives from the federated towns.

The accounts of the quarter were passed for payment.

The memorandum from the Board of Trade re "Court of Arbitration" was considered, and although the principle of the same was approved, it was agreed that the scheme would meet with greater success if the courts proposed consisted of members of the trade affected.

The draft of a new rule to provide for "Arbi-

tration between Sole and Sub-contractors" in cases of dispute was referred to the Administrative Committee, with power to give the required notice for the same to be adopted at the general meeting in December.

A suggestion for amending the conciliation scheme, whereby the same would not be compulsory on local associations, was adopted to send to the Northern Centre

It was decided that this Federation could not see its way to agree to the admittance of labourers into the conciliation scheme.

A dispute that had arisen at Bury under the worked stone rule was considered, and referred to the Administrative Committee.

The recommendations of the plasterers' and slaters' trade committees (referred to above) were confirmed.

After the meeting several of the local employers attended in response to an invitation issued by the Federation to consider the question of organisation in the district, and several members of the Executive (including the president) addressed them on the subject, and as a result the Lancaster employers agreed to call a general meeting of their members at an early date, and to inform the Federation thereof.

LOCAL ASSOCIATIONS AFFILIATED TO THE LANCASHIRE, CHESHIRE, AND NORTH WALES FEDERATION.

ALTRINCHAM, SALE & DISTRICT ASSOCIATION.
Secretary: W. Moody.

The number of members to date is 144.

Nothing of importance has occurred during the past month. Four new members were elected at the monthly meeting on October 8th, and various Federation questions were discussed, particularly the proposal to include labourers in the National Conciliation scheme, the feeling of the committee locally being decidedly against it.

BURNLEY AND DISTRICT ASSOCIATION.
Secretary: G. Astwood.

The annual meeting of the above association was held on October 6th, at the Mechanics' Institution. Mr. Thos. Foster, of Padiham, was in the chair, and there was a fair attendance of members. The balance-sheet was presented, and showed a gain of £3 on the year's working. The number of members on the books is thirty, an increase on the previous year. Mr. Samuel Smith was elected president, Mr. John Stanworth and Mr. Durkin vice-presidents, Mr. John Hanson treasurer, and Mr. Geo. Astwood, 19, Clarence Street, secretary. The meeting decided to subscribe to the "Builders' Journal."

BURY AND DISTRICT ASSOCIATION.
Secretary: Robt. Hall.

During the past month the general committee and the various trades committees have held several meetings, the general committee dealing especially during the past month with amended rules for the better government of the association and its members, and particularly the definition of how far and to whom the inter-trading rules shall apply.

A matter mentioned in the last report—namely, the worked stone rule—is still unsettled, and the secretary reports that there has been no response to his request for information with respect to the working of this rule in other districts.

The annual general meeting will be held some time this month.

LIVERPOOL ASSOCIATION.
Secretary: Bertram B. Moss, F.C.R.A.

The forty-second annual general meeting of the above association was held in the Board room of the association, 24, Sir Thomas Street, on Thursday evening, October 1st. The chair was occupied in the earlier proceedings by the retiring president, Mr. A. L. Haugh, and there were present many past presidents, officers and members.

The annual report, which is very lengthy, dealing with various matters of importance to the trade, and the treasurer's statement of accounts for the past twelve months, were read and approved, and copies ordered to be supplied to every member, also to the various kindred master builders' organisations, local architects, corporation officials, etc. The chief items of interest contained in the report may be thus summarised: (1) A request by the operative joiners for an increase of three-farthings an hour, and for certain alterations in the working rules, was referred to the Conciliation Board, and it was agreed that the operatives should receive an increase of a farthing an hour, with a forty-seven-hour week all the year round except for men on "unprotected buildings" as defined in the rules, the winter hours for the latter men being forty-four and a half per week in November and February, and forty-two in December and January, the men taking their breakfast in their own time before starting work, all the year round. The rules are to remain in force for five years. (2) A claim for insulation money (sixpence per day extra), where the work had no connection with cold storage, but simply consisted of lining partition boards with asbestos sheeting and filling the space between with silicate cotton or slag wool, was paid "without prejudice," the sums involved being only small; but when the new rules were framed, a re-wording of the insulation rule was insisted upon, making it quite clear that the extra money will only be paid in connection with cold storage work. (3) A dispute with the masons was settled in favour of the employers, by the Local Conciliation Board. (4) Masons threatened to strike a member's shop in consequence of the employment of non-society machine hands. The committee resisted the demand, and the matter was allowed to drop. (5) It having been represented by the operative painters' society that several hospitals and charitable institutions have been letting out decorating and cleaning work to firms who are not recognised master painters, and who have in some instances employed persons other than painters to do the work, the council addressed a letter on the subject to all the hospitals and charitable institutions in the district. Favourable replies were received from most. (6) The council has made many representations to architects and corporation officials to the effect that hot and cold water services should be included in the plumbers' bill of quantities, and not given to heating engineers. (7) The Plumbers' Committee have submitted to the city water engineer a list of suggested amendments to the local water regulations, which have been in force without alteration for about thirty years. (8) The association appealed successfully, on behalf of Messrs. Morrison and Sons, against a demand for rates in respect of machinery and temporary offices on the site of the cathedral. The judgment then delivered is of the greatest importance to the building trade throughout the country, and the association is to be congratulated on having brought the matter to such a successful issue. (9) Following action by the association, Liverpool fibrous plaster manufacturers have agreed to allow five per cent. discount to master plasterers wherever practicable. (10) Many communications have been addressed to corporate bodies and architects respecting the conditions of contracts and invitations for tenders, etc., especially in reference to tenders being required without quantities being supplied. Protests were also addressed (a) to the Mersey Docks and Harbour Board in reference to tenders being invited for certain work which the Board subsequently did themselves; and (b) to the Education Committee with respect to new schools at St. Helens, for which the lowest tender was declined, and the Education Committee, instead of accepting the next lowest, insisted upon all firms retendering.

Mr. Frank Griffiths was elected president for the ensuing twelve months, and he then took the chair and thanked the meeting for his election. On the proposition of Mr. William Bullen, a hearty vote of thanks was accorded to Mr. A. L. Haugh, the retiring president, for his valuable services during the past year. The following further officers were then elected: Mr. R. Arthur Costain, senior vice-president; Mr. Chas. Tomkinson, junior vice-president; Mr. R. Stevenson Jones, treasurer; Messrs. H. E. Dallow and J. Sirett Brown, honorary auditors. Thirty-six members were then elected to form the council for the ensuing twelve months. The council is divided up into six trade committees, representing the following branches: Bricklayers, masons, plasterers and slaters, carpenters and joiners, painters, plumbers and glaziers, and electricians; each of these committees consisting of six members.

On the proposition of Mr. J. Sirett Brown, seconded by Mr. William Bullen, it was carried unanimously that the best thanks of the meeting be tendered to Mr. Bertram B. Moss, the secretary, for his services during the past twelve months.

A few matters of general interest were discussed under "General Business," and the meeting terminated with a vote of thanks to the chairman.

The association has for the first time issued a year book, in which the annual report is included.

LONGRIDGE AND DISTRICT ASSOCIATION.
Secretary: T. J. Watson.

The number of members to date is 24.

The twelfth annual general meeting of the Longridge and District Association was held on Thursday evening, October 1st, Mr. S. V. Robinson presiding. The committee's report and balance sheet were adopted. Mr. Thomas Kay, Jun., was elected president, and Mr. Richard Rigby vice-president for the ensuing year.

The Representative Trade Committee was appointed; Mr. William Almond was re-elected executive member, and Mr. Ed. Hesmondhalgh hon. treasurer.

MANCHESTER & SALFORD GENERAL ASSOCTN.
Secretary: John Tomlison.

The number of members to date is 214.

Meetings of all the branch trades are taking place in this district to consider relations with the operatives, the chief object being to bring about if possible uniformity in starting and stopping times throughout the trades.

OLDHAM AND DISTRICT ASSOCIATION.
Secretaries: Cowper and Dean, Accountants.

Business is quiet in the building trade in Oldham, owing to the cotton strike, and the consequent stoppage of mill building, etc. The executive committee are engaged in resisting a proposed amended fair contracts clause for corporation work, which has been submitted to the Oldham Corporation by the Oldham Trades and Labour Council. The clause contains what the master builders regard as stringent and arbitrary conditions, and a deputation has been appointed to wait upon the general purposes committee to represent the association's views. The committee are also waiting for developments regarding some new building by-laws which are proposed to be inserted in the next Parliamentary Bill by the Oldham Corporation. It is also the Committee's desire to endeavour to get all public bodies and architects to make more general use of the National Form of Contract, and action is being taken with this object.

ROBERT HALL,

Building Surveyor,

52, Frederick Street, BURY.

With over 35 years practical experience of the Building Trade, and during the last 15 years a very varied experience in measuring up and adjusting contract and other accounts, is prepared to undertake and submit quotations for the following work:—

The Measuring-up and Adjustment of Accounts,
Collection and Settlement of Accounts,
Assistance given in Estimating,
Annual or other Periodical Stocktakings,
Private Enquiries and Arbitrations undertaken,
or any other special work incidental to that a Builder or Contractor.

52, Frederick St., BURY.

LONDON PLATE-GLASS INSURANCE Co., Ltd.

Head Office: 49, Queen Victoria Street, E.C.

Ten per cent. of the Premiums returned every six years in cases where no claim has arisen.

APPLICATIONS FOR AGENCIES INVITED.

VISIT . . .

'The Builders' Journal'

Stall No. 79.

Any Architect, Contractor or Member of the National Federation or Affiliated Associations is invited to make our Stall a centre for the Collection of Parcels, etc. Letters may also be written there, and the Stall can be made a convenient spot in the Exhibition for meeting friends.

Advertisements for "The Builders' Journal" may be given in there.

PRESTON ASSOCIATION.
Secretary: John Tomlison.

The number of members to date is 183.

The annual general meeting of this association was held at the George Hotel on October 7th, when Mr. William Croasdale presided. There were about 70 members present. The half-yearly report (the thirty-seventh) showed the association to be in a strong position, there being 183 members on the books, whilst the funds in hand had been increased by more than £90 during the financial year. The chairman, in moving the adoption of the report, congratulated the members on what had been accomplished, and felt sure that the prospects of continued success for the association were very bright, notwithstanding the very depressed state of the trade, which he was sorry to say did not present to him any prospect of immediate improvement. The society, having entered upon its nineteenth year, would therefore soon attain its majority, and he had no doubt that a career of usefulness and success was before it, if the traditions of the past were maintained. Mr. T. B. Garnett, builder, was elected president for the ensuing year, with Mr. R. H. Catterall, plasterer, and Mr. S. Salthouse, plumber, as vice-presidents; Mr. William Cooke, junr., being again elected the hon. treasurer. The various committees were appointed, and several matters of trade interest discussed.

ROCHDALE AND DISTRICT ASSOCIATION.
Secretary: H. Oldham.

The number of members to date is 61.

The appeal relating to the advance, etc., required by the carpenters and joiners, came before the National Board of Conciliation in London on September 29th. The voting as regards the question of wages resulted in a tie; therefore there was no decision. As regards the overtime rule, this is naturally governed by the wages question, and therefore no decision resulted. As regards the notice rule, the folowing decision was unanimously agreed to:—"That the words 'that one hour's notice be given on either side, or one hour's wages paid,' be deleted from the first two lines of present rule 8, and the following substituted:—'That one hour's notice be given on either side for men employed in workshops, or one hour's wages paid; and that two hours' notice on either side be given for men employed on outside jobs, or two hours' wages paid.' The rest of the rule to remain as heretofore."

There is nothing to report from the following associations, affiliated to the Lancashire, Cheshire and North Wales Federation:—Ashton-under-Lyne, Barrow-in-Furness, Birkenhead and Wirrall, Blackpool, Bolton and Farnworth, Chester and District, Crewe and District, Darwen, Heywood, Lancaster and District, Leigh and District, Llandudno and District, Macclesfield and District, Middleton and District, Radcliffe, Rossendale and District, Southport and District, St. Anne's-on-Sea and District, St. Helen's, Stockport, Wallasey, Warrington, and Wigan.

THE YORKSHIRE FEDERATION

Secretary; J. DAVIDSON, 14, Park Road, Leeds.

The monthly meeting of the executive council of the Yorkshire Federation was held at the Yarborough Hotel, Grimsby, on Friday, Sept. 25th, 1908. Mr. J. Biggin (president) occupied the chair, and was supported by forty-six delegates from the affiliated associations. The president referred to the serious loss which the Bradford Association had sustained by the deaths of Mr. Phineas Drake, an ex-president, and Mr. Michael O'Flynn, late Alderman of Bradford Corporation, who had for many years taken an active interest in the work of the association. In suitable and feeling terms, he moved "That the Federation having heard with deep regret of the deaths of Messrs. P. Drake and M. O'Flynn, tender their sincere sympathy and condolence to the relatives in the heavy loss which they have sustained, and also place on record their appreciation of the long and persevering efforts of the deceased in connection with the building trade generally, and the Bradford Association in particular." The members approved of the resolution by standing in silence. The minutes of previous meeting were read and approved. Apologies for absence were reported from Messrs. W. Nicholson, P. Rhodes, and W. T. Ledgard (Leeds); G. E. Powell (Sheffield), and G. Rayner (Halifax); and Councillor G. Mansfield, J.P. (York).

The treasurer reported receipt of the following amounts:—Subscriptions, £18 15s. 6d.; contributions to National reserve fund, £4 13s. 6d.; and balance of contribution from Federation insurance scheme to June 30th, 1908, £8 9s. 4d.; making a total of £31 18s. 4d.

On the motion of Mr. A. J. Forsdike, seconded by Councillor England, it was resolved to send a circular to each local association inviting their active support in maintaining the income of the Federation, and pointing out that several associations have not yet made any payment on account of subscription for the present year, while the amounts received from others show a serious decrease; and that it is most desirable, in order that the fixed expenses should be promptly met, that the Federation be favoured with the valued co-operation and generous support of local members and secretaries in this important matter. The treasurer reported that the mortgage deed for investment of £200 with the Huddersfield Corporation had been deposited at the London City and Midland Bank, High Street, Sheffield, where the account of the Federation is kept; and that the bank receipt was in the possession of Mr. Forsdike, treasurer.

Replies were read from the following Associations with respect to their experience of Local Conciliation Boards:—Bradford, Dewsbury, Huddersfield, Leeds, Morley, Sheffield, and Wakefield. There was a consensus of opinion that the work of the Boards was very valuable and mutually beneficial, being conducive to the maintenance of cordial relations with the operatives. It was resolved, on the motion of Councillor Mallinson, seconded by Mr. S. Coop, to notify the Northern Centre that the local associations and the Yorkshire Federation have not experienced any difficulty in connection with the Local Conciliation Boards, but that at all meetings which have taken place the proceedings have been conducted in an amicable and a friendly spirit.

Replies were read from several associations, including Barnsley, Bradford, Dewsbury, Huddersfield, Hull, Leeds, Morley, Scarborough, Sheffield, Wakefield, and York, with respect to the expediency of giving notice for a general reduction of wages. After careful consideration, it was resolved on the motion of Mr. J. Lindley, seconded by Mr. T. E. Taylor, that as the local associations of the Yorkshire Federation have unanimously expressed their opinions that it is not opportune at the present time to give notice for a general reduction in wages, so far as Yorkshire is concerned, this Federation hereby confirm the said decisions, and notify the Northern Centre to this effect.

The secretary reported that several associations have been supplied with copies of the letters to architects, in reference to the National Form of Contract. With respect to local authorities, a discussion took place as to the expediency of first seeking an interview with the local surveyor or engineer with a view of ascertaining how far he was personally disposed to accept the recommendations contained in the approved letter. On the motion of Mr. W. R. Thompson, seconded by Mr. A. J. Forsdike, it was resolved to request the West Riding architect and engineer to favour the Federation by receiving a small deputation consisting of the president, Alderman W. H. Jessop, J.P., and Councillor W. Nicholson; and recommend local associations to follow a similar procedure before officially writing to local authorities with a view to the adoption of the National Form of Contract.

The Chairman reported that, as a result of an appeal by the Sheffield Association, the Sheffield Corporation had modified the clause in the Corporation contract form with regard to retention money, by providing that one-half of the same would be paid at the expiration of six months, and the remaining half at the expiration of twelve months after the date of the certificate of the completion of the contract.

It was reported that the issue of "The Builders' Journal" for September 16th contained the first number of the official reports of the National Federation. In order that the members may receive the report of the Yorkshire Federation in good time, it is probable that the same will be inserted in the issue immediately following the meeting, in addition to being summarised in the monthly supplement dealing with Federation news generally. An urgent appeal was again made to local secretaries and representatives to use every endeavour to obtain subscribers, as this is the most effective manner of making the agreement an assured success.

It was reported that there were eleven branches of the National Association of Builders' Labourers in Yorkshire, and that several of these have entered into an agreement with employers with respect to rate of wages and conditions of labour. On the motion of Mr. J. T. Levitt, seconded by Mr. W. E. Biscomb, the Northern Centre and local associations who have entered into agreement with their National Association of Builders' Labourers were requested to consider and report on the expediency of admitting such association as parties to the Local Conciliation Boards, and whether it is feasible to submit matters upon which the Local Board cannot agree to the Northern Centre Conciliation Board; and generally as to the terms and conditions on which the acceptance of the application for admission should be based.

A statement of the present position of the National reserve fund was supplied to each member, and a letter from the National Federation secretary was read and considered. Mr. A. J. Forsdike moved a resolution, which was seconded by Councillor Mallinson, and duly carried, reminding the National secretary that the Federation has been allotted a contribution on the basis of the commuted subscription which is in excess of the amount due on wages, which basis has been already agreed upon by the administrative committee.

The Federation considered the action of the Board of Trade in establishing a Court of Arbitration in pursuance of the powers granted by the Conciliation Act of 1896. The secretary had prepared some preliminary observations, and it was resolved, on the motion of Mr. A. J. Forsdike, seconded by Mr. W. R. Thompson, to send a copy to each local association and invite them to favour the Federation with their opinions on the several points named, with a view to consideration of the question at a future meeting.

Attention was drawn to the statement of Mr. Shackleton, M.P., that the Home Secretary had promised to take steps for the appointment of a Royal Commission to take into consideration and

report upon the expediency of compulsory insurance. On the motion of Councillor Mallinson, seconded by Mr. S. Coop, the consideration of the matter was deferred to a future meeting.

The president reported that the Northern Centre Conciliation Board had met at Leeds on Monday, September 14th, to consider an appeal from Rochdale with respect to joiners' rate of wages and alterations in rule. After hearing both parties, the Board were not able to come to a decision, the voting on each side being equal. It was stated that the operatives had appealed to the National Conciliation Board, and that a meeting had been called for an early date.

The president reported that the emergency committee had carefully considered correspondence with the Wigan Association secretary arising out of a contract near Wigan which was being undertaken by a member of the Yorkshire Federation. A resolution was unanimously passed, on the motion of Mr. A. J. Forsdike, seconded by Councillor Dawson, "that this Federation are of opinion that the member in question is entitled to be exempt from the new rules for the present contract, in accordance with the special reservation to that effect in the revised rules." The president reported that the emergency committee were desirous of having a conference with the association secretaries at the earliest possible date. It was suggested that it might be held on the day of the next Federation meeting, and that Mr. White, the National secretary, be invited to be present. Councillor G. Haigh, president of the Barnsley Association, stated that if it was in the interest of the Federation to postpone the visit to Barnsley until November, his association will be willing to arrange accordingly. Mr. J. S. Myers, on behalf of the president and members of the Leeds Association, invited the Federation to hold the next meeting in that town. It was resolved, on the motion of Mr. A. J. Forsdike, seconded by Councillor W. G. England, to hold the next meeting of the Federation and conference of secretaries at Leeds, on Thursday, October 22nd.

The Grimsby Association had kindly made arrangements for the members to inspect the Fish Docks, and also provided tea at the conclusion of the meeting. On the motion of Councillor England, J.P., seconded by Mr. A. J. Forsdike, a hearty vote of thanks was accorded to the president and members of the Grimsby Association for their courteous attention and generous hospitality.

LOCAL ASSOCIATIONS AFFILIATED TO THE YORKSHIRE FEDERATION.

HALIFAX ASSOCIATION.

Secretary: A. E. Dalzall.

The number of members to date is 26.

A meeting of this association was held at the Builders' Exchange, Halifax, on September 24th, at 7.30 p.m., the president, Mr. Lewis Firth, in the chair. Minutes of the previous meeting, held April 15th, having been confirmed, the secretary was directed to forward to the Yorkshire Federation the sum of £4 13s., being the contribution on £9,283 on account of wages paid at 1s. per cent. The secretary reported that, in accordance with the arrangements made with Lloyds, the annual return under the Act would be made by Lloyds on behalf of all those members who were covered with them. The secretary also reported that five members had not yet sent in returns of wages paid for the twelve months ending December 31st, 1907, and he was directed to press for the same. He further reported that the new abstract of the Factory Act, Form 57, was now in stock, and could be had by any of the members on application; and that the half-yearly meeting of the Conciliation Board was duly held on May 23rd, when the following officers were elected representatives:—Employers: Builders, Mr. Ben Riley, and Mr. Joshua Robinson; Joiners, Mr. Frank Moore. Operatives: Masons and Carpenters, Mr. Pratt, Mr. Baldwin, and Mr. H. Brown. President, Mr. Ben Riley; Vice-president, Mr. H. Pratt; Secretaries (employers), Alf. E. Dalall, F.A.A., Exchange Chambers, 29, Northgate, Halifax; Masons, Mr. C. Cordingley; Carpenters and Joiners, Mr. J. Booth.

Messrs. Raynor and Naylor reported on the meeting held in Sheffield on July 16th, and the minutes of the Yorkshire Federation meeting, held at Bridlington on August 21st, were read.

The secretary was directed to notify the Federation secretary that the Halifax Association was distinctly against any alteration in the rate of wages in this district, and against any suggestion for general reduction.

Mr. Naylor proposed, and Mr. Bancroft seconded, that the secretary use his best endeavours to persuade architects and others in Halifax and district to adopt the Federation Contract Form.

Mr. Raynor, on behalf of the association delegates, reported that the suggested amendments and alterations to the Halifax County Borough by-laws which had been drawn up by the Committee of Halifax builders, architects, and lawyers, had been submitted to the Council and received by them in a very satisfactory manner, and he reported many valuable and useful suggestions which the Council had conceded, and that generally the committee's work had resulted very satisfactorily. The secretary was directed to interview Mr. Fox, the secretary of the Halifax Architectural Society, and obtain from him a copy of the concessions and circulate them amongst the members as early as possible.

The next meeting is to be held on Thursday, November 5th, at the Halifax Building Trades Exchange, at 7.30 p.m.

SHEFFIELD ASSOCIATION.

Secretary: T. Smith.

There was a good attendance of members at the September monthly meeting of the Sheffield Association. Mr. T. Eshelby presided.

The question of the allowance by builders' merchants of preferential terms to builders again arose, on a statement by the secretary, who reported that a member had placed in his hands for sight the price list of a builder's merchant which he had obtained from a private person, and which bore an impress from a rubber stamp giving trade terms. The secretary also presented anonymously the letter of a builder's merchant—a member of the association—which stated, in reply to a builder's enquiry, that they (the merchants) could not allow the 10 per cent. asked for on goods supplied, as the architect had been told that their quoted prices were absolutely net.—Both matters were left over for discussion at the forthcoming meeting of the association and the Master Builders' Association.

A letter was read from the Operative Bricklayers' Society complaining that masons were being allowed to cut brickwood. It was pointed out that the complaint only referred to the cutting of holes for fitters, and that it did not therefore constitute a breach of the rules.

The secretary was instructed to send out a gummed printed slip to be attached to rules in workshops, calling attention to the commencement of short time on October 24th instead of November 1st, as agreed at the annual meeting of the local Conciliation Board.

A letter covering a copy of the corporation's proposed new by-laws was read from the town clerk. The letter was received on the Tuesday morning, and stated that the City Council proposed to confirm the by-laws on the Wednesday. At the instruction of a few members of the committee, he at once sent a letter of protest to the town clerk, pointing out that as the proposed by-laws embodied some drastic alterations the association requested that they should be referred back, so as to give the association an opportunity of considering them, and, with the assistance of the architects, the by-laws had been referred back at the council meeting, despite the most strenuous opposition. A committee, consisting of the president, and Messrs. J. Biggin, J. D. Cook, A. J. Forsdike, T. Roper, and J. A. Watson, were appointed to consider the by-laws and consult with the highways committee of the corporation, if such a meeting could be arranged.

In reply to a letter from the Yorkshire Federation, the secretary was instructed to say that the local Conciliation Board was a great success, that the association had recently obtained a concession from the city council in reference to retention money on corporation contracts, making the retention now only 5 per cent. and six months' maintainence instead of 10 per cent. and 12 months'. So far as the National Form of Contract was concerned, the matter was at the moment under discussion with the local architects' society, who had pointed out that they were advised by the R.I.B.A. that a defect in the contract was that while it provided for the bankruptcy of the client, it did not provide for such an eventuality on the part of the contractor.

A letter was ordered to be sent to the treasurer, Mr. A. Martin, expressing the sympathy of the association with him in his serious illness, and the hope that he would be speedily restored to health.

The treasurer's statement showed the finances of the association to be in a healthy position, the total already collected for the current year being £42 17s. 1d. more than for the whole of 1906, and £6 5s. 1d. more than for the whole of last year.

With respect to obtaining direct representation on the city council, the secretary regretted to have to report, on behalf of Mr. Forsdike, who was unavoidably absent, that he had definitely decided not to contest a seat. It was then suggested that as a prospective councillor could not be obtained this year, a vigilance committee should be formed, and the constitution of the committee was left over to next meeting.

The matter of fixing uniform holiday week so as best to meet the operatives was discussed, and left over for further discussion.

The secretary referred to the published minutes of the city council with reference to estimated wages from the model cottages at Wincobank, and the way in which that revenue was shewn to be effected by the provision of such roads as the Council stipulated for on other building sites.

A letter was read from the Architects' Society in reference to p.c. sums, and in reference to insertion of an item in quantities to cover workmen's compensation. The architects stated that they had obtained legal opinion on the point, and were satisfied that the risk belonged exclusively to the builder so far as payment for insurance was concerned.

It was mentioned that a circular letter with reference to the inter-trading rule had been sent out to all ordinary members requesting them to make to the secretary in confidence a return of all the merchants and manufacturers with whom they were trading with the object of inducing such persons and firms to become associate members of the association.

WAKEFIELD ASSOCIATION.

Secretary: J. Beaumont.

The number of members to date is 30.

The monthly meeting of this Association was held at the Strafford Arms Hotel, Wakefield, on October 1st, Mr. Tom Lee (president) in the chair.

The minutes of the previous meeting having been read and confirmed, the president, Alderman Judge, and Mr. Fallas reported on the busi-

Firms entitled to the benefits of the Intertrading Clauses with Associations are especially invited to send announcements for these columns.

ness transacted at the Yorkshire Executive Council meeting, which they had atended in Grimsby on September 25th, and several matters arising out of this report were discussed.

The correspondence since the last meeting was also read, and a discussion was opened by the president and Mr. Sanderson with reference to the rate of insurance of plasterers' workmen under the Workmen's Compensation Act, and, on the proposition of Alderman Judge, seconded by Mr. Fallas, the secretary was instructed to write on the matter to Mr. Davidson, the Federation secretary.

It was reported that since the last meeting the circular letter drawn up by the Yorkshire Federation had been sent to each local architect and surveyor, and certain replies were submitted, dealing especially with the wishes of the members of the association for the inclusion in quantities of an item to cover the insurance against risks under the Workmen's Compensation Act. Arising out of this, an important discussion took place with regard to the liability of the undertakers of the work to workmen of the contractors in certain events. The working rules with the operative joiners were produced, which had been signed on behalf of the operatives, and arrangements were made for the signing of them on behalf of the employers.

On the motion of Alderman Judge, seconded by Mr. Fallas, the secretary was directed to attend the meeting of secretaries to be held in Leeds this month.

YORK ASSOCIATION.

Secretary: J. Hague.

The general quarterly meeting of the above association was held at the Old George Hotel, Pavement, on Tuesday, September 22nd, at 8 p.m. The president (Mr. G. Sharp) took the chair, and presided over a good attendance of members.

The minutes of last meeting having been read and confirmed, the president referred to the Yorkshire Federation meeting, which had been held in York since the last general meeting of the local association. A well-attended and interesting meeting had been held, and he thought the delegates enjoyed their visit to York.

Reduction of Wages.—This question, which had been referred to the local associations for consideration, having been discussed, it was unanimously resolved that the time was inopportune to consider the question of any reduction, and that a letter to that effect be sent.

Schedule of Prices.—The recommendation of the executive that the day's-work schedule be revised, and that committees be appointed for that purpose, was brought forward. Mr. G. Rawling proposed, "That we do not proceed further with the matter." The proposition receiving no seconder, Mr. C. Dent proposed, Mr. Biscomb seconded, and it was carried, "That the recommendation of the executive be adopted." Representatives of the various trade sections were then elected to serve on the revision committees.

Federation Letter to Architects and Surveyors.—This letter was read and approved, and it was unanimously agreed that the following additional recommendation be sent out with reference to cases in which it was usually stipulated that tenders should be sent in accompanied by schedules of quantities: "That the schedule of quantities be sent separate from the tender in a marked and sealed envelope, and that only the successful contractor's schedule be opened, the remainder to be returned unopened."

Builders taking off Own Quantities.—The chairman, on opening the discussion, said that a good deal of time was spent in this way by contractors, for which they got no return for their labour. It seemed to him unfair, both to the contractor and the architect, for builders to take off quantities. Mr. Biscomb said it was inadvisable to make a hard-and-fast rule. Much depended on the circumstances of each particular case. He should strongly oppose any resolution which might be brought forward having a tendency totally to prohibit the practice. Mr. Fairweather suggested that a minimum price might be fixed, and no tender should be given for work exceeding such minimum price, unless quantities were supplied to the contractors. After further general discussion, Mr. England proposed, and Mr. G. Rawling seconded: "That this association refuses to give tenders for any work put up for open contract by advertisement unless quantities be supplied." Mr. Fairweather proposed as an amendment: "That this association refuses to give tenders for any contracts amounting to a minimum of £150 (all trades) unless quantities be supplied." No seconder coming forward, the amendment fell through, and the original proposal was put to the meeting and declared carried.

There is nothing to report from the following associations affiliated to the Yorkshire Federation:—Barnoldswick, Barnsley, Bradford, Bridlington, Dewsbury, Grimsby, Harrogate, Huddersfield, Hull, Leeds, Malton (Norton), Morley, Scarborough, and Shipley and District.

THE NORTHERN COUNTIES FEDERATION.

Secretary: W. H. Hope, Solicitor, Post Office Chambers, 14, Norfolk Street, Sunderland.

The quarterly and general meeting of the Northern Counties Federation was held at the Grand Hotel, Sunderland, on Tuesday, September 29th, at 4 p.m., when the attendance numbered 36. The minutes of the last quarterly meeting, held at the Cottage Exhibition, Walker Gate, on July 15th, which had been printed and circulated, were taken as read.

The executive council's reports upon the following subjects were received and adopted:—Suggested reduction of the wages of the operatives; Federation and other local associations taking up shares in the Federated Employers' Insurance Association, Ltd, Manchester; "Builders' Journal"; annual return of membership.

The secretary read the correspondence that had passed between this Federation and the Northern Centre with respect to the working of the scheme for the settlement of disputes in the building trades, which showed that so far the conciliation scheme within this Federation had worked satisfactorily.

Two important questions at issue with the Durham County Council have reference to the principle of independent arbitration for the settlement of disputes, and the proposal that the bill of quantities should be part of the contract. Representations have been made to the council by this Federation, but without avail, as to these two important matters. On the proposition of Mr. A. Ross (South Shields), seconded by Mr. H. McNaughton (Middlesbrough), it was unanimously resolved "That a deputation be appointed from this Federation to meet the Education Building Committee of the Durham County Council at their next meeting to go fully into the two important questions at issue, and failing to secure a modification of the conditions of contracting, that the members of this Federation pledge themselves to refuse to tender; and that the deputation consist of Messrs. S. Easten, G. Gradon, J. Davison, J. W. White, A. Ross, W. T. Weir and the secretary, with power to appoint a substitute if necessary. And that all the members of the Buildings Committee be written to fully explaining the grievances of this Federation."

The president drew attention to the loss the Federation had sustained by the death of Mr. T. Banks, of South Shields, a valued member of the Federation, and, seconded by Mr. A. Ross, it was resolved, the members standing:—"That a letter of condolence be sent to his widow and family expressing this Federation's sympathy and regret."

It was resolved that the annual meeting of the Federation be held at Newcastle-on-Tyne in December.

Those present were afterwards entertained to tea by the Sunderland Association, to whom a hearty vote of thanks was accorded for their hospitality.

LOCAL ASSOCIATIONS AFFILIATED TO THE NORTHERN COUNTIES FEDERATION.

MIDDLESBROUGH ASSOCIATION.

Secretary: Walter Rigby.

The monthly general meeting of the Middlesbrough Association was held on Tuesday, October 6th, the president, Mr. W. S. Davison, in the chair.

With reference to the circular issued by the Streets Department of the Corporation, *re* the opening up of streets, for drains, etc., the committee who have this matter in hand reported that a meeting with the road superintendent had been held, and a schedule of prices, with certain conditions, for the making good of roads opened up, was considered and agreed upon, subject to the approval of the council. The schedule is based upon prices per lineal yard, for ordinary macadam roads, tar, macadam roads, stone and scoriæ brick paving, and woodblock paving. Minimum width of trench 2 ft. The builder to excavate and fill in ready for top crust, but not to supply or lay concrete bottom. Insertion of junction, or flanged socket connection according to size of main pipe.

It was resolved that the secretary, if possible, attend the National Conference of Secretaries in London on October 20th.

Mr. J. Bainbridge, builder and contractor, Redcar, was accepted for membership.

The resolution of the Northern Counties Federation in appointing a committee to interview the Durham County Council in reference to the contract agreement was approved.

SOUTH SHIELDS ASSOCIATION.

Secretary: J. G. Robertson.

It will be remembered that it was recorded on page 255 of this journal of September 30th, that the members of the South Shields branch were still deploring the death of one of their number, Mr. Samuel Deacon (who had been for many years an active member of the committee, and one of the honorary auditors of the branch, and who had died at the early age of forty-four), when they were further shocked by the death, on September 8th, of another valuable colleague, Mr. Thomas Banks, at the age of fifty-five. The branch now has to mourn yet another death—the fourth that has occurred within the short space of three months. Never before, as far as can be remembered, has our branch lost so many members within so short a period. Mr. Frank L. Pearson, who passed away early on Saturday morning, October 3rd, at his residence in Wentworth Terrace, South Shields, was 63 years old. He was a member of the firm of Henry Wilson and Co., timber merchants, Mill Dam. His business brought him into close contact with most of the shipbuilders and builders in the district, among whom he made many close personal friends. He was a Freemason and a member of the "Hilda" Lodge. He leaves a widow and a son and daughter.

At the monthly meeting of this branch (Councillor J. T. Armstrong presiding), when there was a large and representative gathering, the proposed new rules for the branch, which had been drawn up by a small committee and sent out in draft form to all our members were gone over serially. With the exception of the alteration in the title of our branch from "Northern Counties Federation of Building Trade Employers, South Shields Branch," to the 4' South Shields Branch of Building Trades Employers, affiliated with the Tyne and Blyth District of Building Trades Employers, and with the Northern Counties Federation of Building Trades Employers," the draft rules, with one or two minor alterations, were unanimously approved of as the rules of our branch.

The chairman referred to the question of having a telephone card printed with list of members and sub-traders on, to help to put into real operation the inter-trading rule, which provides that members shall as far as possible deal with members of the branch, and giving a preference to sub-traders who are members. Eventually it was agreed to leave the preparation of a draft form in the hands of the treasurer, the president, and the secretary.

After a long conversation, in which practically all the members present took part, it was unanimously agreed that the time was not opportune to seek a reduction in the wages of the operatives in the different trades.

STOCKTON-ON-TEES ASSOCIATION.

Secretary: W. C. Creasor.

On September 17th a presentation was made to Alderman T. E. Atterby, J.P., and Mrs. Atterby, on their marriage. Mr. John Davison, president of the association, occupied the chair, and in asking Alderman and Mrs. Atterby's acceptance of a handsome silver tea urn and a silver rose bowl from the members of the association, referred to the very prominent part Alderman Atterby took a number of years ago in helping to establish the association. He was one of the most respected members of the building trade in the North of England. Mr. Johnson and Mr. Brown also spoke. The latter said he had not had the pleasure of being associated with Alderman Atterby so long as other members of the Association, but from what he had seen of his work, Alderman Atterby deserved the thanks of his fellow builders. Mr. Creasor, the secretary of the Association, took the opportunity of thanking Alderman Atterby for the great assistance he had received from him in the early days of the Association. Alderman Atterby had spared neither time nor money for the Association in its beginning. Practically every honour the Association, or the Northern Federation could confer would have ben Alderman Atterby's, but he refused them all, saying he was content to remain one of the rank and file, and his thanks would be to see the Association really strong and alive. Alderman T. E. Atterby expressed his thanks for the valuable present they had made to Mrs. Atterby and himself. He was afraid they had over-estimated the little work he did towards organising the Master Builders' Association. He was glad the day of disputes and lock-outs was past in connection with their trade, and that now all these labour difficulties were dealt with by a Conciliation Board. He thought the proud position they were in was ample reward for the trouble they had taken in establishing associations all over the country. Strikes and lock-outs were a disgrace to civilisation, as, no matter how long a strike or lock-out lasted, they generally had to refer the matters to arbitration in the end. Mrs. Atterby also briefly expressed her thanks. The meeting was unique in the annals of the Association, as, for the first time, ladies were present.

SUNDERLAND AND DISTRICT ASSOCIATION.

Secretary: W. H. Hope, Solicitor.

A general meeting of this association was held in the board-room on Tuesday, October 6th. Among the business was the reception of a resolution passed at the quarterly meeting of the Northern Counties Federation of Building Trades Employers with respect to securing fair conditions of contracting from the Education Buildings Committee of the Durham County Council. The two important questions at issue are—the principle of settlement of disputes by an independent arbitrator, and that the bill of quantities shall be part of the contract.

There is nothing to report from the following associations affiliated to the Northern Counties Federation:—Blyth, Hartlepools, Newcastle-on-Tyne, North Shields, and Teeside.

THE MIDLAND CENTRE OF THE NATIONAL FEDERATION.

Secretary: F. W. AMPHLET, 58, New Street, Birmingham.

A meeting of the emergency committee was held at the secretary's offices, on September 10th, Mr. Wm. Wistance (president) being in the chair. The meeting had been called specially to consider the resolution passed at the last half-yearly meeting with reference to the revision of the Centre's rules. After some conversation, it was decided that the rules should be revised and reprinted. A few of the rules were discussed in detail, after which the secretary was instructed to draw up a copy of suggested rules (embodying the decisions arrived at by the committee), and to send printed proofs of same to the members of the committee prior to their next meeting.

With reference to the resolutions passed at the last half-yearly meeting of the National Federation in regard to the approved Form of Contract, the secretary was instructed to obtain, through the local associations, the names and addresses of all mayors, town clerks, borough surveyors, chairmen of spending committees, and other officials in the district, and to forward same to the National secretary. The emergency committee met again on October 1st, when the copy of suggested Midland Centre rules, drafted by the secretary, was considered, and, with slight alterations, approved and recommended to the Executive Council for adoption. The secretary was instructed to forward a copy of the proposed rules to each local association for consideration prior to the Executive Council meeting, October 15th.

LOCAL ASSOCIATIONS AFFILIATED TO THE MIDLAND CENTRE.

NORTHAMPTON ASSOCIATION.
Secretary: A. L. Airs.

The number of members to date is 35.

The annual general meeting of the Northampton Association was held on Friday evening, October 9th, at the Peacock Hotel, Northampton, when there was a representative attendance of members. The chair was taken by Mr. Henry Green, president. The minutes of the last annual general meeting were adopted, and the accounts up to June 30th, 1908, were passed.

The following officers were unanimously elected for the ensuing year:—Mr. Edwin Archer to be president, Mr. R. W. Harris to be vice-president, Mr. H. W. Hanwell hon. auditor, and the executive committee.

Hearty votes of thanks were accorded to the outgoing president, vice-president, and other officers, who suitably replied.

The annual dinner is to be held at the Angel Hotel, Northampton, on Thursday next, October 15th.

NOTTINGHAM ASSOCIATION.
Secretary: W. J. Barton, F.C.I.S.

There is little to report this month. Trade is still bad.

The matters mentioned in the last report are still having attention, further correspondence having been addressed to the city authorities and to the Architects' Society, while an interview was held with the Ironmongers' Association, but the negotiations have not yet advanced sufficiently to enable a report to be made.

[It will be remembered that last month it was reported that the association had appointed a sub-committee to consider several matters of interest and importance to the trade—for example, the increasing number of p.c. items in quantities, ironmongers declining to allow discounts on goods which the builder has to fix and pay for, and other matters of a similar character.]

WALSALL ASSOCIATION.
Secretary: J. L. Sweet.

The monthly meeting of this association was held on Friday evening, September 25th, when the chair was taken by the president, Mr. W. Wistance, and there was a fair attendance of members. The Census of Production Act, and the return issued by the Board of Trade thereunder, were discussed at considerable length by the meeting, as was also the new Form of Contract, and it was decided to recommend the members to use the new form on all possible occasions. The arrangement with the National Federation as to the "Builders' Journal" was also mentioned, and the members present expressed their intention of supporting the journal, the general appearance and contents of which were highly commended. The other matters considered were of minor interest.

The building trade in the Walsall district is still very quiet, and the prospect for the coming winter is far from encouraging.

There is nothing to report from the following associations affiliated to the Midland centre:—Birmingham, Bromsgrove, Burton-on-Trent, Coventry, Derby, Dudley, Hinckley, Kidderminster, Leamington, Leicester, Lincoln, Long Eaton, Loughborough, Mansfield, Newark, North Staffordshire, Nuneaton, Redditch, Stafford, Stourbridge, West Bromwich, Wolverhampton, and Worcester.

LOCAL ASSOCIATIONS AFFILIATED TO THE SOUTHERN COUNTIES FEDERATION.

There is nothing to report from the following associations affiliated to the Southern Counties Federation:—Brighton, Chatham and District, Gravesend, Maidstone, Portsmouth, and Southampton. We should be glad to hear from the secretaries of these associations.

THE EASTERN COUNTIES FEDERATION.

LOCAL ASSOCIATIONS AFFILIATED TO THE EASTERN COUNTIES FEDERATION.

GREAT YARMOUTH ASSOCIATION.
Hon. Secretary: R. J. Hill.

The number of members to date is 46.

The first monthly meeting after the summer vacation should have been held on Tuesday evening, October 6th. The secretary, in his usual course, advised every member by postcard, but much regretted that, in the result, only three members put in an appearance, so that no business could be done. Probably the slackness of work in this district has had a depressing effect on the members. The secretary, however, expresses the earnest hope that every member will make a special effort to attend the next meeting, which takes place on November 3rd, as that will be the annual meeting. A committee meeting will be called to make the necessary arrangements for this meeting.

There is nothing to report from the following associations affiliated to the Eastern Counties Federation: Cambridge, and Norwich.

THE SOUTH-WESTERN CENTRE OF THE NATIONAL FEDERATION.

COMPOSED OF

The South-Western Federation, and The South Wales Federation.

Secretary: W. F. LONG, 3, Northumberland Buildings, Bath.

THE SOUTH-WESTERN FEDERATION.

Secretary; W. F. LONG, 3, Northumberland Buildings, Bath.

LOCAL ASSOCIATIONS AFFILIATED TO THE SOUTH-WESTERN FEDERATION.

BATH ASSOCIATION.
Secretary: E. J. B. Mercer.

There are no matters of particular interest to report this month. The slight dispute mentioned in the last report is we hope in a fair way for a satisfactory settlement.

Trade is still very dull.

Councillor J. W. Knight, J.P., president of the Bath Master Builders' Association for the present year, has accepted the office of Mayor of Bath for the ensuing year.

BRISTOL ASSOCIATION.
Secretary: A. J. Pitt.

The ordinary monthly meeting of the members of the Bristol Association was held on Thursday, September 24th, under the presidency of Mr. Frank N. Cowlin, when the principal business for consideration was in reference to the suggested amendment in the fair wages clause in the Corporation form of contract. As previously reported, an interview took place between representatives of the Association and the Bristol Trades Council in reference to a resolution (moved by the secretary of that body in the City Council), proposing an amendment in this clause, to which the master builders took exception as being impossible for them to carry out, when it was decided that each side should further discuss the matter, and endeavour to frame a clause which they considered would be acceptable to all parties, and submit same to the other side for their approval. The sub-committee appointed at the last meeting to deal with this question reported that they had met and drafted a clause which they considered would meet the case, and this, after full discussion by the members, was approved. It was accordingly decided to communicate with the Bristol Trades Council suggesting that the amended clause as moved in the City Council be approved, with, however, the elimination of the last paragraph—"For the purposes of this clause, a sub-contractor shall be deemed to include any person who employs workmen in the preparation of materials to be used by the contractor in carrying out his contract," and the substitution of the following:—"For the purposes of this clause, sub-contractors shall be deemed to include all specialists, merchants, tradesmen, or others executing any specific trade or portion of the works sub-let to them by the contractor for the purposes of the contract, with the approval of the architect or engineer." The complete clause thus reading:—"The works shall not be assigned or sub-let as a whole to any contractor, nor is any portion of the works to be sub-let without permission in writing from the architect (or engineer, as the case may be), and then only to responsible parties approved by the architect (or engineer); and the fact of any sub-contractor being permitted by the architect (or engineer) to undertake portions of the work shall not relieve the contractor from the full and entire responsibility attaching to the contractor, including responsibility under the clause herein contained with reference to the payment of wages and the observance of the hours and conditions of labour, nor from active superintendence of the works either personally or by a qualified agent during their progress. Provided that if the contractor shall be required by the architect (or engineer), the Corporation, or the specification to employ any particular sub-contractor, he shall not be responsible for work done or materials supplied by such sub-contractor, nor shall he be responsible to see that the clause relating to the payment of wages and the observance of the hours and conditions of labour is carried out with reference to the persons or workmen employed by such sub-contractor, nor for anything arising out of such sub-contract. For the purposes of this clause, sub-contractors shall

be deemed to include all specialists, merchants, tradesmen, or others executing any specific trade or portion of the works sub-let to them by the contractor for the purposes of the contract, with the approval of the architect or engineer."

The sub-committee mentioned that they had received considerable assistance in framing the amended clause from a letter received from Mr. A. G. White, the secretary to the National Federation, arising out of the report upon this question which appeared in the "Builders' Journal," and in which, amongst other matters, that gentleman had suggested endeavouring to induce the Corporation to adopt the National Form of Contract. The letter was read to the meeting, and the secretary was instructed to thank Mr. White for the valuable suggestions contained in his letter, which had been of great assistance, but to point out that, much as the members would like to see the adoption of the National Form of Contract by the Civic Authorities, yet they feared it was absolutely impossible to bring about such a change, the Association having already spent years in arriving at the present form, which, however, was a very fair and equitable one, and based upon the National Form. It may be mentioned that, thanks to the efforts of the Association, the National Form of Contract is almost universally used in this city.

The president reported that the Association had been in communication with the Joint Trades Committee in reference to the formation of the Local Conciliation Board, but that there were one or two matters which he desired to bring to the notice of their secretary, which could be best done at an interview, and accordingly the president was desired to take an opportunity of discussing the matter with that gentleman.

There is nothing to report from the following associations affiliated to the South-Western Federation:—Bridgwater, Cheltenham, Exeter, Gloucester, Hereford, Stroud, Taunton.

THE SOUTH WALES FEDERATION.

Secretary; W H. BILLINGS, Salubrious Chambers, Swansea.

There is nothing to report from the following associations affiliated to the South Wales Federation:—Cardiff, Newport, Pontypridd, and Swansea.

SCOTTISH BUILDING TRADES FEDERATION.

Secretary: JAMES CAMERON, Solicitor, 61, Lothian Road, Edinburgh.

The annual general meeting of the Scottish Building Trades Federation was held in the Imperial Hotel, Stirling Street, Aberdeen, on Friday, September 18th, Mr. James Leslie, vice-president, presiding. Delegates were present from Aberdeen, Dundee, Inverness, Edinburgh, and other centres. Apologies for absence were intimated from Oban, Hawick, Paisley, Perth, and Glasgow Master Builders' Associations.

The report by the executive, with the treasurer's account of intromissions for the past year, were read and adopted. The cash account closed with a substantial balance at the credit of the Federation.

In their report, the executive regret that again they are obliged to record that the building trade throughout Scotland is in a very unsatisfactory condition. It is recalled that at the last annual meeting a resolution was passed protesting against the decision of the Home Secretary not to appoint a member of the Scottish building trades on the Departmental Committee who had to enquire into the different systems of scaffolding in use. The scaffolding regulations which the Departmental Committee had framed were found in many cases to be altogether inapplicable to Scotland, and the protest passed at the annual meeting was sent to the Prime Minister, the Home Secretary, the Lord Advocate, the Secretary for Scotland, the Solicitor-General, and thirty-two Scottish members of Parliament. The witnesses from Aberdeen and Edinburgh who gave evidence before the Departmental Committee in London, carefully went over the report and regulations proposed by them. Many amendments were made thereon, and these were duly communicated to all the associations in the Federation, who were asked to say whether they approved or had any further amendments to propose. The several Glasgow associations were similarly approached, and now a set of amendments have been unanimously adopted for submission to the Home Secretary. It is further reported that efforts to get the Glasgow Employers' Council into the Federation have not, so far, met with success. It is believed that all the associations in Glasgow have not yet joined the Employers' Council, and this may to a certain extent explain why Glasgow is still outside the Federation. Other matters dealt with in the report are the Census of Production Act, 1906, the object of which is to obtain the quantity and value of the production carried on in the United Kingdom in the year of return; workmen's compensation insurance; and the inter-trading rule, which, in Scotland, so far, only Edinburgh has taken up in earnest.

Reports on the state of trade all over the country were read by the secretary, and, without exception, they were all in the same strain—dull trade, and little prospect of improvement.

Preliminary notice of the Conference of Secretaries to be held in London on October 20th, was next read, but it was decided that the Federation would not send the secretary this year. Mr. Cameron has, however, decided to go to the conference at his own expense; for he recognises the great educational value of such conferences.

The proposed scaffolding regulations were again brought up, and the secretary gave a report on the amendments proposed to be made thereon. It was agreed that a deputation be appointed to wait upon the Home Secretary in London, to bring these amendments under his notice, and to support same, and Messrs. James Leslie and George Farquhar, Aberdeen, along with Mr. John Lownie, Edinburgh, were appointed to go as a deputation.

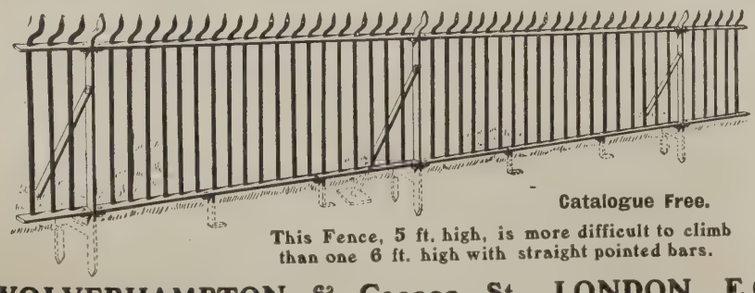
As regards workmen's compensation insurance, the secretary outlined one or two schemes whereby a collective insurance arrangement might be come to; but after due consideration it was agreed that each member should insure at his own risk.

The secretary then read a paper on "Federation Organisation," pointing out how the Federation could be worked to better advantage if properly organised. [The substance of this paper appears in another part of the present issue.]

A deputation, consisting of Messrs. Craig and T. C. Stocks, Dundee, and the secretary, was appointed to go to Perth to endeavour to stir up some interest there.

The election of office-bearers resulted as follows:—President, Mr. James Leslie, Aberdeen; vice-president, Mr. Hector McVinish, Inverness. Delegates to National Federation, Messrs. James Leslie and Hector McVinish.

It was agreed to have the half-yearly executive meeting in Perth in April, 1909.



After the meeting, the delegates were entertained to lunch by the Aberdeen Building Trades Federation.

There is nothing to report from the following associations affiliated to the Scottish Federation:—Aberdeen, Alloa, Dingwall, Dumfries, Dundee, Hawick, Inverness, Keith, Kilmarnock, Oban, Paisley, Perth.

ASSOCIATIONS IN IRELAND.

There is nothing to report from the Dublin and Belfast Associations. We should be glad to hear from them, and trust that next month they may have something interesting to report.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Oct. 15. HENSINGHAM.—Erection and completion of seven cottages at Hensingham. Plans and specifications may be seen at the office of J. S. Stout, architect and surveyor, 36, Lowther Street, Whitehaven, to whom tenders are to be delivered by noon on October 15th.

Oct. 15. DARLINGTON.—Additions and alterations to the Offices of the guardians of the Darlington Poor Law Union. Persons desirous of tendering for the whole of the work may inspect the drawings, specification, conditions of contract, and obtain bills of quantities at the offices of the architects, Hoskins and Brown, Court Chambers, Darlington, until October 14th. Sealed tenders, endorsed "Tender for Additions and Alterations to offices," to be sent by noon on October 15th, to Chas. H. Leach, clerk to the guardians, Union offices, Darlington. Fair wages clause.

Oct. 15. LEAVESDEN (Herts).—Erection of a small open-air Balcony at the schools at Leavesden, near Kings Langley, Herts, for the guardians of the poor, in accordance with drawings and specification, which may be seen at the office of the surveyors, W. T. Farthing and Son, 46, Strand, W.C., between 10 a.m. and 4 p.m. Bill of quantities can be obtained on application to the surveyors. A deposit of one guinea is required to be made with the surveyors. Tenders upon the form provided, accompanied by priced bill of quantities fully marked out, in a separate sealed envelope, bearing outside the name of the contractor, must be delivered by 10 a.m. on October 15th, to Alfred A. Millward, clerk to the guardians, town hall, Pancras Road, N.W.

Oct. 15. WAKEFIELD.—Execution of the following works for the West Riding County Council:—Thorpe Salvin Provided School, via Worksop—Alterations and addition. Builder, painter, joiner, slater, plumber, plasterer, asphalter. Catcliffe Provided School, via Sheffield—Repairs and improvements. Joiner and plumber. Woodsetts Provided School, via Rotherham—Alterations, etc. Builder, joiner, slater, plumber, painter, asphalter. Treeton Provided School, via Rotherham—New heating chambers. Builder, joiner, painter, slater, plumber. No heating engineer. Plans may be seen and bills of quantity obtained on application to the county architect. A deposit of £1 is required in each case. Deposits must be posted to the West Riding treasurer, County Hall, Wakefield. A separate letter must be sent to the West Riding architect asking for quantities. Sealed tenders properly endorsed to be forwarded by 10.30 a.m. on October 15th to J. Vickers Edwards, county architect, Wakefield,

Oct. 16. BUSHEY.—Alterations and additions to the Merry Hill county council school at Bushey, for the Hertfordshire County Council. Persons desirous of tendering may see the drawings, specification, agreement, etc., at the county surveyor's office, Hatfield, between 10 a.m. and 4 p.m., Saturday, from 10 a.m. till noon. A copy of the schedule of works (quantities) and form of tender can be obtained at the county surveyor's office upon deposit of 2 guineas. Sealed tenders, endorsed "Tender for Merry Hill School, Bushey," must be delivered not later than 5 p.m. on Oct. 16, to Urban A. Smith, county surveyor, county surveyor's office, Hatfield. Security for the due erection of the works must be given by the contractor.

Oct. 17. KINGUSSIE.—Mason, carpenter, slater, plumber, plasterer, painter, and glazier works of two large villas to be erected on West Terrace. Plans and specifications may be seen with the architect, Alexander Mackenzie, C.E.

Oct. 17. PLYMOUTH.—Erection and completion of a horse slaughter-house at Prince Rock. Plans and specifications can be seen, and forms of tender and bills of quantities obtained, on deposit of £1 in cash with James Paton, borough engineer and surveyor, municipal offices, Plymouth, where conditions may be seen.

Oct. 17. LEEDS.—Erection of a transformer chamber (overground) in East Street, Leeds, for the electric lighting department of the Leeds Corporation. Specifications, plans, etc., may be seen and forms of tender obtained on application to H. Dickinson, manager of the department, 1, Whitehall Road, Leeds. Tenders must reach Robert E. Fox, town clerk, town hall, Leeds, by October 17th, endorsed "Tender for Transformer Chamber—Electric Lighting."

Oct. 17. SOLOHEAD (Co. Tipperary).—Repairs and improvements to Catholic church at Solohead, Co. Tipperary, for the parish committee. Drawings and specifications may be seen on application to the treasurer, Patrick Ryan, Hotel, Limerick Junction, to the priests of the parish, or at the office of O'Malley and O'Rourke, architects, 10, Glentworth Street, Limerick. Sealed tenders, endorsed "Tender for Solohead Church," will be received by the secretary, P. Doherty, Barnaleen, Monard, Tipperary, up to 1 p.m. on Oct. 17.

Oct. 17. NEWPORT (Mon).—(1) Extensions and alterations new playgrounds, and other work at the Tynewydd council school, Newbridge. (2) Asphalting playgrounds, matchboarding ceilings, and other repairs, to the Troedrhiwgwair council school, near Tredegar. (3) Asphalting playgrounds at Garnyrerw council school, Blaenavon. (4) Blocking floors at St. Dials council school, Cwmbran. (5) Repairs at Pontlanfraith council school, all for the Monmouthshire education committee. Plans and specifications can be seen at the offices of the secretary. Sealed and endorsed tenders, in separate envelopes for each school, to be sent by October 17th to C. Dauncey, secretary, county council offices, Newport, Mon.

Oct. 19. DILTON MARSH, WESTBURY, (Wilts).—Erection of four pairs of Cottages at Dilton Marsh, Westbury, Wilts., for the Westbury and Whorwellsdown Rural District Council. Persons desirous of tendering can inspect plans, specifications, and general conditions at the office of the council's architect, Gerald Stanley, Market House, Trowbridge. Copies of the bill of quantities can be obtained from the architect, on the payment of one guinea. Sealed tenders endorsed "Tender for Cottages" to be delivered by noon on October 19th to John Callaway, clerk to the council, Westbury, Wilts.

Oct. 19. BANGOUR (Scotland).—Works required in the extension of a greenhouse at Bangour, for the Edinburgh District Board of Lunacy. Plans, specifications, and general conditions of contract may be obtained on application to the architect, Hippolyte J. Blanc, R.S.A., 25, Rutland Square, Edinburgh. Offers to be lodged by 10 a.m. on Oct. 19, with James Kyd, clerk and treasurer, Edinburgh District Board of Lunacy, Castle Terrace.

Oct. 19. CASTLETON MOOR, ROCHDALE.—Erection of branch baths at Castleton Moor, for the Corporation of Rochdale. Plans, specifications, etc., prepared by Wallis and Bowden, architects, may be seen and quantities, form of tender, and all other particulars obtained at the town hall, Rochdale, on payment of one guinea. Tenders, endorsed "Branch Baths," must be delivered by Oct. 19 to Wm. Henry Hickson, town clerk, town hall, Rochdale.

Oct. 19. DUBLIN.—Erection of two four-roomed gatekeepers' cottages, in masonry, between Armagh and Keady, masonry tank house at Keady, one four-roomed gatekeepers' cottage at Drumclay Crossing near Enniskillen, for the Great Northern Railway Company (Ireland). Parties wishing to tender may see the drawings and specifications at the office of W. H. Mills, engineer-in-chief, Amiens Street terminus, Dublin; or copies at the office of the district engineer, Belfast, and can obtain at the said offices forms of tender on payment of one shilling each (not returnable). Tenders, made out on the forms supplied to be delivered, under sealed cover, endorsed "Tender for ——," to T. Morrison, secretary, Amiens Street Terminus, Dublin, by 10 a.m., on October 19th.

Oct. 20. AMMANFORD.—Erection of bank premises and two shops adjoining in Quay Street, Ammanford, for Joseph Phillips. Plans and specification can be seen with Joseph Phillips, The Square, Ammanford, and quantities obtained upon payment of £2 2s., at the offices of Arthur S. Williams, M.S.A., architect and surveyor, Llandilo, to whom sealed and endorsed tenders are to be sent by October 20th.

Plans, specification, and general conditions of contract may be seen and bills of quantities obtained at the Office of the County Education Architect, Shire Hall, Durham. Sealed tenders (endorsed with name of school) to be sent by October 20th to A. J. Dawson, clerk to the education committee, Shire Hall, Durham.

Oct. 20. DURHAM.—Alterations and improvements at Flint Hill, Marley Hill Colliery, Croxdale, and Hetton girls' and infants' council schools, for the county council. Plans, specifications, and general conditions of contract may be seen and bills of quantities obtained for Flint Hill and Marley Hill Colliery council schools only at the office of F. E. Coates, A.R.I.B.A., Shire Hall, Durham. Sealed tenders, endorsed with name of school, to be sent to A. J. Dawson, clerk to the education committee, shire hall, Durham, not later than Oct. 20.

Oct. 20. LEICESTER.—(1) Pulling down nine tenements, etc., in Colton Street, and (2) erection of six cotages on the site thereof, for the Corporation. Particulars may be obtained at the office of E. George Mawbey, M.Inst.C.E., borough surveyor, town hall, Leicester. A deposit of £1 will be required in respect of quantities for Contract No. 2 only. Sealed tenders on the forms supplied, addressed to "The Chairman of the Watch Committee," must be delivered at the town hall, by noon on Oct. 20, endorsed "Tender for Pulling Down, or Cottages," or as the case may be.

Oct. 22. MORLEY. — Various works except mason's required, in addition and alteration to Glen Mills, Morley, for Albert Glover. Quantities to be obtained at the office of T. A. Buttery, Exchange Buildings, Queen Street, Morley, on Oct. 15. Tender to be sent to the proprietor, Glen Mills, Morley, on Oct. 22.

Oct. 23. SHREWSBURY.—Erection of elementary schools at Coleham, Shrewsbury, for the education committee of the corporation. Persons desirous of tendering are requested to send their names to the architects, A. B. and W. Scott Deakin, 12a, Pride Hill, Shrewsbury, by Oct. 23. Quantities will be supplied on deposit of one guinea.

Oct. 23. GLANTON, near Alnwick.—Demolishing existing offices, and erecting new latrines, etc., at Glanton schools for the managers. Plan, specifications, bills of quantities, and forms of tender are deposited with the schoolmaster at the school house, Glanton. Tenders, endorsed, to be sent to H. W. Walton, clerk to the managers, Fenkle Street, Alnwick, by October 23rd.

Oct. 23. LONDON.—Extension of the Royal Courts of Justice (first contract), for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to Sir Henry Tanner, I.S.O., F.R.I.B.A., at Storey's Gate. Bills of quantities and forms of tender may also be obtained there on payment of one guinea. Tenders must be delivered before noon on Oct. 23, addressed to the secretary, H.M. office of works, etc., Storey's Gate, London, S.W., and endorsed "Tender for Royal Courts of Justice Extension, First Contract."

Oct. 19, 28. LAINDON (Essex).—Erection of iron buildings, and additions and alterations to existing buildings, and other works at the Laindon branch workhouse, Essex, for the Poplar Board of Guardians, in accordance with drawings and specification prepared by the architects, J. and W. Clarkson, 136, High Street, Poplar, E. Drawings and conditions of contract may be seen at the offices of the architects, and specification and form of tender obtained upon payment to the architects of three guineas. Persons desirous of tendering for the work must send their names to the architects, by Oct. 19. Tenders, sealed and endorsed "Tender for Additions and Alterations at the Laindon Branch Workhouse," must be delivered by 6.30 p.m. on Oct. 28, to G. Herbert Lough, clerk to the guardians, 45, Upper North Street, Poplar, London, E. Parties tendering will be required to name two sureties, each of whom must be willing to be bound in half the amount of the contract for the fulfilment of same. The successful contractor must only employ the men whose names are on a list supplied by the Poplar distress committee, or the Poplar Employment Exchange. The contractor is at liberty to choose and employ a foreman. Fair wages clause.

Oct. 21—Nov. 14. BRENTWOOD.—Erection and completion of a new central kitchen, etc., at Brentwood asylum, for the visiting committee of the Essex county lunatic asylum. Drawings, specifications, conditions, and form of contract may be inspected at the office of the county architect, Frank Whitmore, 73, Duke street, Chelmsford, between 10 a.m. and 4 p.m., any day except Saturday. Contractors desirous of tendering must

send their names and addresses to the county architect, by noon on Oct. 21, enclosing £5 deposit. Sealed tenders, on the form supplied, endorsed "Tender for New Kitchen, Brentwood Asylum," must be delivered by 10 a.m. on Nov. 14, to W. P. Gepp, clerk to the committee of visitors, Chelmsford. The contractor whose tender is accepted may be required to find security in the sum of £500, for the due performance of contract.

Oct. 24. NORWICH.—Erection of a secondary school, with alterations to existing buildings, at Eaton Road. Personal application must be made at the offices of C. J. Brown, architect and surveyor, Cathedral offices, The Close, to inspect the drawings, specification, etc., after which form of tender, etc., can be obtained at the city accountant's office, Municipal Buildings, upon depositing Bank of England notes of the value of £25.

Oct. 26. WILMSLOW (Cheshire).—Erection of new council schools, to accommodate 700 scholars, at Wilmslow, Cheshire, for the Knutsford and Wilmslow administrative sub-district committee. Plans, specifications, etc., prepared by Herbert H. Brown, architect, may be inspected at his offices, 17, Dickinson Street, Manchester. Persons desirous of tendering must send their names to the architect, accompanied by a deposit of two guineas, before Oct. 9. Tenders, enclosed in sealed envelopes, endorsed "Tender for Council Schools at Wilmslow," must be delivered by 10 a.m. on Oct. 26, to George Leigh, clerk, union offices, Knutsford, Cheshire.

Oct. 29. SCUNTHORPE.—Erection of a fire station, highways depot, cart sheds, and public convenience at the corner of Mary Street, E., and Cole Street, for the U.D.C. Plans, sections, and details may be seen, and any further information given upon application to Walter F. Bickford, engineer and surveyor, Engineer's and Surveyor's Office, Home Street, Scunthorpe. Form of tender, general conditions, specifications, and bill of quantities may be obtained upon payment of two guineas. Tenders, sealed and endorsed "Tender for Fire Station, Buildings, etc.," to be addressed to F. C. Hett, clerk, 2, Trafford Street, Scunthorpe, and delivered by noon on Oct. 22.

Oct. 31. LEEDS. — Erection of the firemen's dwellings and hose tower, in Park Street, for the Corporation. Contractors desirous of tendering must send their names, accompanied by a deposit of one guinea, to the architect, Percy Robinson, F.R.I.B.A., Yorkshire Post Chambers, 53, Albion Street, on Oct. 31, when bills of quantities will be forwarded. Tenders, endorsed "Firemen's Dwellings," must be delivered by Nov. 18, to Robert E. Fox, town clerk, town hall, Leeds.

No date. WEST LYNN.—Alterations to cottages at West Lynn, for Wm. Wing. For bill of quantities and all information apply to Walker and Walker, architects and surveyors, Wisbech and Terrington.

No date. NANTWICH. — Erection of new schools in Hospital Street, Nantwich, for the Wesleyan Methodist school trustees. Bills of quantities and form of tender may be obtained from R. Matthews, architect, Parr's Bank Chambers, Nantwich, on payment of £1 1s.

Burch, clerk, 39, Castle Street, Canterbury, by Oct. 19.

Oct. 28. WOOLWICH, S.E.—Tar paving work at the Brook fever hospital, Shooter's Hill, Woolwich, S.E., in accordance with drawing, conditions of contract, and specification prepared by W. T. Hatch, M.Inst.C.E., M.I.Mech.E., engineer-in-chief, for the Metropolitan Asylums Board. Drawing, conditions of contract, specification, and form of tender may be inspected at the office of the Board, Embankment, E.C., and can be obtained upon deposit of £1. Tenders, addressed as noted on the form, must be delivered at the office of the Board, by 10 a.m. on Oct. 28.

Late News.

Derby.—Sir Henry Bemrose on Saturday laid the foundation stone of a Men's Institute in connection with St. James's Church. The new building, which is to be called The Olivier Institute, in memory of the late Canon Olivier, the founder and a great benefactor of St. James's and St. Thomas's Churches, will be on land adjoining the former church in Dairy House Road, and the total cost will be about £1,000.

Leicester.—The contract for the technical and art schools extension, Leicester, amounting to £11,090, has been let, the successful contractor being Mr. Thomas Herbert, of Leicester. The new buildings consist of a four-storey block along the south side of the site, forming, with the existing building, half the quadrangle, which it is hoped will be made complete at some future time. Provision in the new buildings is made for engineering workshops, building trades classes and workshops, physical laboratories and lecture-rooms, chemical laboratories and lecture-theatre, balance and store rooms, etc., and also class-rooms for commercial and science subjects. The heating and ventilation will be by the Plenum system, and the construction generally is of a fire-resisting character. The present school was erected about twelve years ago. The architects for the extension are Messrs. Everard, Son, and Pick, of Leicester, and this firm designed the original building.

London, Fulham.—The tower and belfry of the Parish Church have been repaired, and the bell rehung, at a total cost of more than £700.

Paddock, Yorks.—Four memorial stones were laid on the 10th inst. at the Paddock Adult School Institute. The institute is to be erected at the north end of a plot of ground enclosed by Cowslip Street, Robin Street, and Raven Street, and the main approach will be from the last-named street. The ground floor will comprise reading-room and library 24ft. by 18ft. 6in., committee-room, conversation-room, secretary's office, lavatories, bath-rooms, etc. On the first floor will be an assembly hall 44ft. by 30ft., with raised platform at one end, a well-lighted billiard room 44ft. by 24ft., games room, vestibule and entrance hall, lavatories, etc. The building will be lighted by electricity, and heated by radiators on the low-pressure system. The following are the contractors for the various works:—Masons, Messrs. W. S. Firth and Co., Crosland Moor; joiners, Messrs. W. and J. Singleton, Paddock; plumbers, Messrs. E. Bould and Son, Huddersfield; plasterers, Messrs. Robinson and Shaw, Paddock; painters, Messrs. W. and P. Holroyd, High Street; slater, Mr. Alfred Bower, Crosland Moor; concreter, Mr. John Cooke, Huddersfield; and electricians, Messrs. E. Bould and Son, Huddersfield.

Redcar, Yorks.—The new police station, erected at a cost of £6,000, has been completed, and the constabulary entered into possession on Saturday. The scheme includes residences for an inspector and a sergeant, quarters for ten single constables, and all modern police requirements.

Walsall.—The Queen Victoria Memorial organ has been formally opened in the Town Hall. The instrument, which has been constructed under the supervision of Mr. C. W. Perkins, city organist, Birmingham, has cost £2,300.

Appointments Wanted.

The charge for Advertisements under this heading 1s. 6d. per insertion for the first four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two. Advertisements can be received up to 10 o'clock on Tuesday morning.

ADVERTISER requires situation in south of England; experienced in all branches of land and building surveying, levelling, quantities, dilapidations, 5 years with Urban Council, near London; good draughtsman; qualified P.A.S.I.—Box 4538, BUILDERS' JOURNAL Office.

ARCHITECT'S Assistant seeks engagement; has had nine years' experience in good offices (London and the provinces); just completing engagement with City firm; excellent testimonials; moderate salary.—Box 4636, BUILDERS' JOURNAL Office.

ARCHITECT (practising) is willing to assist others in all kinds of architectural and office work, at own office, or elsewhere.—S., 143, Cannon Street, E.C. 4528

ARCHITECT and surveyor's assistant (22), wide experience, working drawings, details, and full sizes; specifications, measuring and supervising, etc.; excellent refs.; salary 30s.; trial willingly.—Box 4596, BUILDERS' JOURNAL Office.

ARCHITECT and surveyor's assistant desires engagement, 15 years' experience; good draughtsman, colourist, etc., working drawings, details, specifications, surveying, levelling, and general routine; moderate salary; excellent references.—A. R., 1, Ivy Villas, Cheam, Surrey. 4557

ARCHITECT'S Assistant, fully qualified, wide experience; excellent testimonials, desires London engagement, whole or part time. — Box 4601, BUILDERS' JOURNAL Office.

ARCHITECT and Surveyor's Assistant (24); 9 years' London exp.; working drawings, specifications, superintendence, quantities and land surveying; prizeman, architectural drawing, and quantities; medallist building construction; excellent testimonials; mod. sal.—W., 20, Holmewood Road, Streatham Hill, S.W. 4592

ARCHITECT'S and Surveyor's Assistant (21) requires engagement with good architect, 3½ years' student in architect, construction and kindred subjects, land surveying and levelling. Board of Education qualifications; prelim. R.I.B.A., refs.—Apply Box 4572, BUILDERS' JOURNAL Office.

ARCHITECTURAL Improver, or junior assistant (21), excellent knowledge in good design, very neat and clever draughtsman; assist quantities, surveying, perspectives; moderate salary; specimens.—Box 4635, BUILDERS' JOURNAL Office.

ASSISTANT, A.R.I.B.A. (29), thirteen years' London experience, working drawings, perspectives, specifications, supervision; office work; well up in management; salary 2 guineas; London preferred.—Apply Box 4622, BUILDERS' JOURNAL Office.

ARCHITECT and surveyor's managing assistant, A.R.I.B.A., desires engagement at home or abroad. Twenty years' experience. Good testimonials and references.—C. A. C. Springfield, 31a, Leyland Road, Lee, S.E. 4542

ARCHITECT'S Assistant, well recommended, 14 years' good all-round experience; practical, working and detail drawings, quantities, specifications, supervision; salary 2½ guineas. — Box 4536, BUILDERS' JOURNAL Office.

ARCHITECT and surveyor's junr. assistant; 5½ years' experience; working and detail drawings; levelling, perspectives, specifications; assist quantities; excellent testimonials; moderate salary.—Box 4546, BUILDERS' JOURNAL Office.

ARCHITECT'S Assistant (21) seeks re-engagement (abroad if required); 5 years' all-round exp.; ecclestical, domestic and public buildings; prepare, working and detail drawings from rough sketches; surveying, leveling, etc.; P.R.I.B.A.; honours in construction, etc.—Box 4639, BUILDERS' JOURNAL Office.

ARCHITECT and surveyor's assistant, 10 years' good all-round experience, north and south; take charge; capable draughtsman; working drawings, details, quantities; moderate salary.—W. T., 49, Whitstable Road, Canterbury. 4561

ARCHITECT'S Assistant (23), over 7 years' London and Provincial experience; excellent references. Inter.R.I.B.A. Exam.—H. J. Wilson, 17, Clifton Road, Crouch End, N. 4612

ARCHITECT'S and Surveyor's Assistant desires change; 6 years' varied general experience; assist quantities, good refs.—Box 4617, BUILDERS' JOURNAL Office.

ARCHITECT'S Assistant, 7 years' experience, desires engagement in London or provinces; designs, working drawings, details, etc.; excellent references; moderate salary. — Apply Box 4548, BUILDERS' JOURNAL Office.

ARCHITECT'S son, 10 years' office experience, wishes to take up agency or post as representative in Lancashire, or North of England, to well-known firm in any special line of Building trade.—Apply Box 4585, BUILDERS' JOURNAL Office.

BUILDER'S clerk, used to double entry, dissecting time sheets, etc.; good general experience; draughtsman; within 60 miles radius.—Henry, 4, Plimsoll Road, Finsbury Park, N. 4493

BUILDER'S or Architect's Assistant (24), seeks re-engagement; drawing, typewriting, shorthand, correspondence, accounts, and general office routine; also assist in quantities; 9 years' references; moderate salary.—Apply Box 4626, BUILDERS' JOURNAL Office.

BUILDER'S Clerk and assistant (20), seeks engagement, general experience, book-keeping, time sheets, plans, etc.; good references, and moderate wages.—Apply Box 4555, BUILDERS' JOURNAL Office.

BUILDER'S Assistant desires situation. Sixteen years' experience in office routine, estimating, measuring, accounts, etc. Also experienced in outdoor management. Moderate salary.—W. P., 65, Leicester Road, East Finchley. 4569

BUILDER'S and decorator's clerk seeks situation, well up in all trades; ten years' experience; age 26; Midlands preferred; wages moderate.—Apply Box 4599, BUILDERS' JOURNAL Office.

BUILDER'S assistant desires change, 29, abstainer, experienced, quantities, plans, surveying, estimating, book-keeping, shorthand, typewriting, measuring, variation accounts, supervise jobs; excellent references; moderate salary.—Box 4604, BUILDERS' JOURNAL Office.

BUILDER'S Clerk (24), seeks situation; 7½ years' London experience. P.C. jobbing, wages; schedule work and assist estimates; good refs.—B., 11, Belitha Villas, Barnsbury, N. 4608

CLERK of Works, 16 years' experience, supervision and management of important buildings in London and country, well up in details, special knowledge of ecclesiastical buildings. — T. B., Box 4603, BUILDERS' JOURNAL Office.

CARPENTER and joiner, work wanted, piecework; any quantity; labour only; good references.—W., 14, Gorrings Park Avenue, Mitcham, Surrey. 4526

CARPENTER and joiner wants work; bench fixing, alteration, or jobbing. Could take charge of general work. Life abstainer. Good references. Age 32. Very energetic.—Pearson, 53, Hartham Road, Isleworth, W. 4471

ESTATE, Buildings Manager (33), desires re-engagement; ten years' experience in mills, farms, cottages, etc., including the preparation of plans, quantities, estimates and accounts; good knowledge of timber trade; salary 3 guineas; country preferred; abstainer.—Box 4632, BUILDERS' JOURNAL Office.

ENGINEER wants post, London or Provinces; 12 years' experience, calculations, quantities, designs, detail drawings, bridges, structural steelwork, prepared, reinforced concrete.—Box 4579, BUILDERS' JOURNAL Office.

FOREMAN Painter (working); life experience; good colourman; do any class of work; manage any number of men; life abstainer; non-smoker; good references.—T., 39, Northbrook Road, Croydon, Surrey. 4625

GENERAL Foreman, just completed West-end job; experienced and capable.—Reply J. L., 20, Wellington Avenue, Lower Edmonton. 4618

GENERAL Foreman shortly disengaged, just finishing large job; town or country; thirty years' experience; thoroughly practical in all branches; good manager; steady and reliable; first-class testimonials.—W. R., New Council Schools, Biddulph Moor, Congleton. 4621

GENERAL Foreman, long and varied experience in town; thoroughly practical; good at reinforced concrete work; trade joiner; moderate wages; good references.—50, Peel Road, Wembley. 4565

GOOD Classic Details. Architect's Assistant with 10 years' thorough experience in good offices on important classic and renaissance work, disengaged. Give part evenings to competition work; age 28; salary £2 5s.—Apply to H. G., Box 4638, BUILDERS' JOURNAL Office.

IMPROVER, surveyor's or builder's office (21), technical student, four years' practical knowledge, supervise, neat draughtsman; abstainer; good references.—Marfleet, Totland Bay, I.W. 4581

IMPROVER, brass-finisher, requires situation; 3 years' previous experience with well-known London firm; excellent references. Apply Box 4550 BUILDERS' JOURNAL Office.

JUNIOR Assistant desires situation, home or abroad; good practical knowledge of construction and details; competent draughtsman and colourist, working drawings, measuring and supervising, surveying and levelling; moderate salary.—Box 4613, BUILDERS' JOURNAL Office.

LATE Pupil (22), four years' experience, requires berth as surveyor's or architect's assistant, drawing, surveying, levelling, qualified Stage III., Building Construction and Architecture.—J. W. D., Laurelwood, Hare Lane, Godalming. 4582

MANAGER of masonry works or general foreman, well up in management of men and machinery, London and country experience; practical in all trades. — Thomas, 38, Napier Road, Tottenham. 4602

PLUMBER (26), abstainer, well up in all sanitary or lead-laying; will do piecework; town or country. Can do zinc and hot water.—W. E. B., School House, Muriel Street, Barnsbury, N. 4615

PLUMBER, experienced (registered), gas and hot water fitter, new jobbing, sanitary work, good lead layer, desires permanency; excellent references; town or country. — Box 4556, BUILDERS' JOURNAL Office.

QUANTITY Surveyor, Member Q.S.A., 32, eight years' practical building experience, eight years' office practice, desires post as senior or managing assistant.—Box 4610, BUILDERS' JOURNAL Office.

SLATE MERCHANTS AND BUILDERS' MERchants.—Experienced traveller (with 14 years' connection Midlands), desires re-engagement; at liberty middle of December; or could arrange earlier.—Address, Slate, c/o Secretary, Builders' Exchange, Sheffield. 4624

SLATING and tiling wanted (labour only) day or piece; any quantity, large or small; distance no object.—Mack, Slater and Tiler, 3, Granville Cottages Tower Hamlets Street, Dover. 4619

SHOP or General Foreman, long West-end experience, used to alterations and repairs; understands stairs; used to good jobbing work. Address A., c/o Mr. Seymour, 14, Allsop Place, Regent's Park, N.W. 4586

STUDENT R.I.B.A., 23, well trained man, desires situation as assistant; 1½ guineas. — Box 4607, BUILDERS' JOURNAL Office.

TO Estate Owners.—Builder (38), varied experience, desires position as agent or clerk of works, surveys, plans, quantities, setting out, accounts and supervision; country preferred.—Box 4591, BUILDERS' JOURNAL Office.

Property & Land Sales

By EDWIN FOX AND BOUSFIELD.

At the Auction Mart.

On Wednesday, October 21, at Two o'clock.

To be let on Building Leases, in Four Lots.

CITY OF LONDON (on the verge of).—FREEHOLD BUILDING SITES advantageously situate, being Nos. 1 and 3 and 2 to 18 (even) Clifton Street, Nos. 31 to 37 (odd) Sun Street, Nos. 32 to 38 (even) Earl Street, and Brown's Buildings, with access also to Appold Street, close to Finsbury Square and the railway termini at Liverpool Street and Broad Street. The property possesses the extensive fontages of 175 ft. to Clifton Street, 82 ft. to Sun Street, and 72 ft. to Earl Street, and covers the total area of about 30,000 superficial ft., and is admirably adapted, both from the extent and position, for the erection of manufacturing warehouses or other commercial premises suited to the various trades carried on in the locality.

Building leases for 99 years from December 25, 1908, will be granted at rents to be determined by competition, subject to an allowance of one year's peppercorn.

Lot 1.—8,800 super. feet.
Lot 2.—7,500 super. feet.
Lot 3.—12,600 super. feet.
Lot 4.—1,100 super. feet.

Particulars at Messrs. Edwin Fox and Bousfield's office, 99, Gresham Street, Bank, E.C., and of the vendor's solicitors, Messrs. Kinsey, Ade and Hocking, 9, Bloomsbury Place, W.C.

CITY OF LONDON.—FENCHURCH STREET.—LETTING by AUCTION of an important BUILDING SITE of 3,000 square feet, being Nos. 1 to 5 NORTHUMBERLAND ALLEY, situate one door from Fenchurch Street and next to Lloyd's Avenue.

MESSRS. NORTON, TRIST and GILBERT will LET by AUCTION, at the AUCTION MART E.C., on TUESDAY, November 3, 1908, the above SITE on BUILDING LEASE for 90 years from Xmas, 1909.

Particulars, with plan, etc., of Messrs. Dawson Bennett and Co., Solicitors, 2, New Square; or Messrs. Waterhouse and Co., Solicitors, 1, New Court, Lincoln's Inn, W.C.; at the Mart; and of the Auctioneers, 70, Queen Street, Cheapside E.C.

October 21, 1908 Volume 28, No. 715.

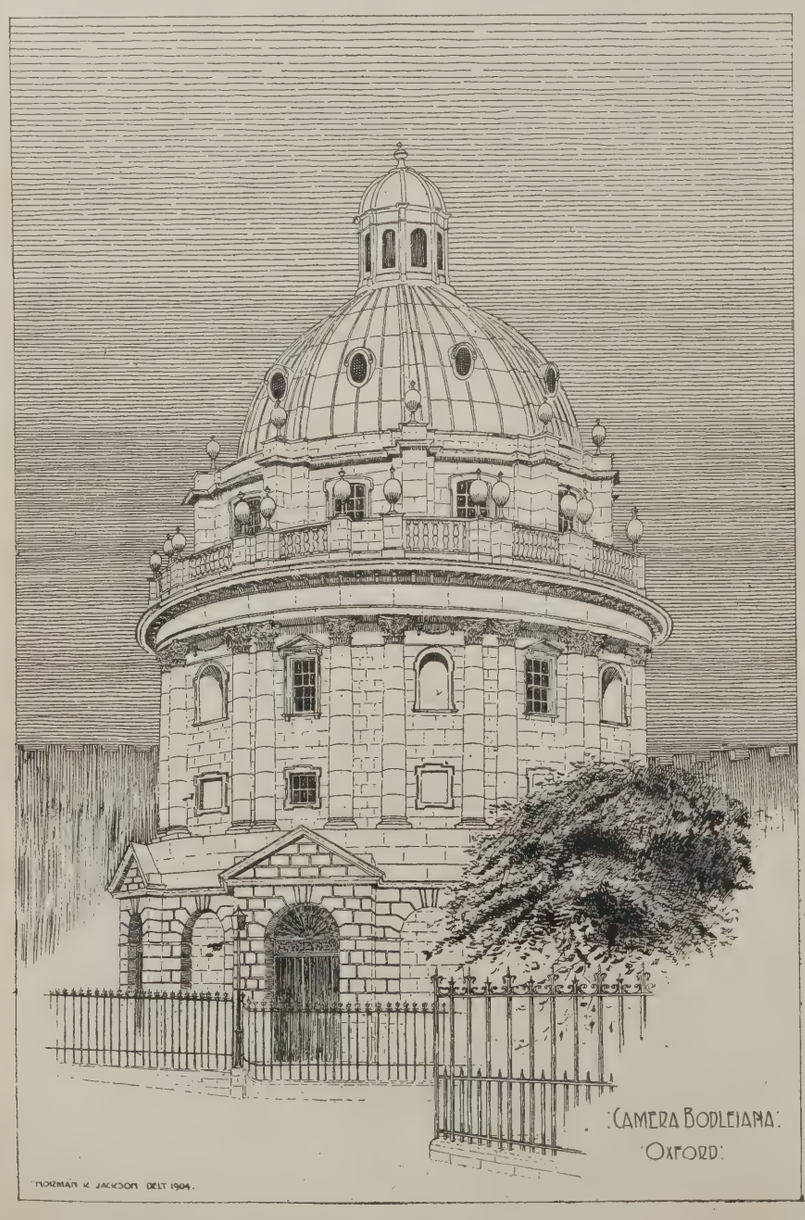
Hearth and Home.

An interesting discussion took place in the House of Commons on October 12th on the necessity for the provision of guards to open firegrates. It will be remembered that clause 14 of the "Children's Charter" provides that where a person having the custody of a child who is under seven years old allows the child to be in any room containing an open firegrate that is insufficiently protected, and the child is killed or suffers serious injury, the custodian of the child is liable to a fine not exceeding £10. Mr. Rawlinson, the member for Cambridge University, moved to omit this clause *in toto*. Mr. Samuel, the Under-Secretary of the Home Department, who has throughout had this Bill in hand, in replying, said that the Government attached the greatest importance to retaining this particular portion of the Bill, and instanced in support of it that some 1,400 children were burned to death every year in England and Wales in consequence of unguarded fires; also that he had been shown a simple but excellent fire-guard which could be bought at the price of 1s., so that the expense could not be said to press heavily upon anyone. Mr. Samuel might perhaps have carried his argument a little further. It is an axiom that a demand will cause a supply, and it is obvious that the demand for a fireguard could also be met by the supply of a guarded firegrate. It is probable, too, that the demand would be made principally by the occupants of the cottage properties and smaller flats. Surely, the owners of such properties might be counted upon to supply any legislative requirement that would enhance the letting value of their tenancies, providing, first, that the expense was nominal, and, secondly, that it did not need frequent renewal. The most reputable owners of these properties do now, as a matter of fact, make an allowance when calculating their percentages for all reasonably required fittings and repairs, and probably they would not raise any serious objection to an addition of this character. What is wanted, then, is a guarded firegrate. Many improvements in open fireplaces have been recently made, but they have been chiefly directed towards the creation of more thorough combustion of the fuel. It should not be beyond the powers of inventors to devise a safety arrangement that could be put into or out of use at will, and that at the same time would not disfigure the fireplace.

Fair Wages Clause in Contracts.

This question is attracting special attention, owing to the activity which the representatives of labour are now displaying in their endeavours to increase the stringency of existing clauses in municipal and Government contracts. A Departmental Committee of the Treasury has been considering this question as affecting Government contracts, and our Federation reports in last week's issue contain references to what is being attempted in regard to municipal contracts in Oldham and Bristol. The clauses suggested by the Labour representatives show an endeavour to procure, under cover of a fair wages clause, privileges and advantages which have no real connection with the matter, as, for example, at Oldham, where the clause suggested demands liberty for workpeople to fulfil the usual conditions of membership, such as paying or collecting subscriptions, at any place or time required by the workpeople, "provided that the duties of workmen are not thereby interfered with." Obviously this is a question that should be dealt with in framing the trade rules governing the relations between employer and employed, and it is not the business of municipal authorities to pull the chestnuts out of the fire for the workmen by enforcing, under the guise of a fair wages clause, a privilege which the employers would probably not willingly concede to a direct demand on the part of the men. The remaining clauses of the Oldham demand are equally inadmissible, making them, as they would, parties to contracts for the execution of which they incur no responsibility, and permitting an intolerable amount of inquisition and interference on their part. In the case of Bristol, much of the suggested clause was supererogatory, the conditions sought to be imposed being already adequately provided for in the general clauses of all building contracts. It is of much importance that builders' associations everywhere should keep a watch on all such attempts to modify accepted fair-wages clauses, and that such associations should at once take up the question with any corporation which is approached by the workmen with such insidious designs. It is also essential that some general form of clause should prevail throughout, and it is therefore advisable for builders' associations to consult their Federation, whose officers are experts in such matters, before committing themselves to any suggested revision of existing accepted fair-wages clauses.



Captious Quacks.

According to a somewhat cryptic proverb, "there is reason in roasting eggs." Mr. Paul Ogden, F.R.I.B.A., president of the Manchester Society of Architects, seems to think that there is usually manifest far less reason in "roasting" architects. In his lecture on "Architectural Aims," delivered at the Municipal School of Art, Manchester, on October 14th, Mr. Ogden declared that architecture suffers to an almost unimaginable extent from meaningless criticism, both by laymen and even by practitioners. The captious critic, it is contended, should be compelled to give a sound reason for the faith that in in him before it can be admitted that his criticism is valid, or is in the least degree worthy of attention. Thus would "the tongues of busybodies and quacks be silenced, and schools of art, technical schools, and universities, would not be worried for detailed explanation of their teaching methods." Possibly Mr. Ogden's meaning has been obscured by condensation of the report. Otherwise it would appear that we are to insist on reasons from our critics, but are to give none ourselves. We cannot believe that this is one of Mr. Ogden's "Architectural Aims." And why should architects allow themselves to be worried by ignorant criticism? Much, surely, may be learned from it, even when it is the worst kind of claptrap or quackery. As for "silencing the busybodies and quacks," that consummation seems to be neither possible nor altogether desirable, pending the millennium. Art and character should rise superior to it all; and if, in the nature of things, they cannot "by opposing end it," they may at least make it the whetstone of truth. That, one vaguely discerns, is its peculiar function in the cosmic scheme. Wherefore let us suffer fools gladly, and be not frighted with the false fires exhaled or kindled by busybodies and quacks.

"This Desirable Dwelling."

An auctioneer's opinion on house property should be valuable to builders. The man who "puts 'em up" may often derive very serviceable hints from the man who "knocks 'em down"; the latter's point of view affording the larger opportunities of examination and comparison. Auc-

tioneers, as a class, are uncommonly astute men of business; and the president of their Institute is—at any rate, for the nonce—at the head of his profession. Hence the presidential address delivered on October 14th by Mr. Arthur George Dilley to the Auctioneers' Institute of the United Kingdom commands our respectful attention. His address necessarily dealt with the topical aspects of Britain's two greatest industries, agriculture and building. His remarks on agricultural holdings need not trouble us for the moment. We are more closely concerned with what he had to say about the exodus from towns, and the consequent slump in flats. He seems to think that there are signs of a revulsion from this movement. "People of all classes are asking why they should waste time in daily journeys to what becomes really a dormitory, and is situated a long way from all the central institutions which cater for amusement and instruction." He believes that the skill of architects may eventually evolve a type of flat that, differing essentially from what, with the facile eloquence of the rostrum, he stigmatises as "the huge vertical slums styled 'Dwellings,'" shall be of moderate height, extensive air-spaces, abundant light, and some artistic quality, and that, by their situation, shall enable the toilers to walk to their work. He has not much faith in garden cities. They are either "the abiding places of faddists," or, where they are connected with industrial concerns, they place the worker in a position of dependence. He believes in the healthy development, by independent effort, guided by something on the lines of an equitable town-planning scheme, of the nearer suburbs. This seems to him to be a better way, and to offer a more practical and more rational solution of present-day building problems, than any combination of the faddism, philanthropy, and five-per-cent. order; and builders are but little likely to say him nay. On the contrary, they will probably envy the professional felicity with which he has expressed their inmost thoughts.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Oct, 31	BURY. NEW SECONDARY SCHOOL for the Education Committee. Premiums of £50, £25, and £10. Particulars and site plan from Robert Wilkinson, Director of Education, 8, Bank Street, Bury. Deposit £1 1s.
Oct. 31	*ROMFORD. COUNTY HIGH SCHOOL FOR GIRLS. Applications for Conditions to D. T. Williams, 71, South Street, Romford, Essex, to be made by or before August 24th, accompanied by deposit of five guineas, of which sum five pounds will be returned on receipt of bona fide design.
Nov. 1	CARDIFF. COUNTY HALL AND OFFICES. Particulars and site plan from T. Mansel Franklen, Clerk, Glamorgan County Council Offices, Cardiff.
Nov. 14	WHITEHAVEN. NEW PUBLIC ELEMENTARY SCHOOL, Irish Street, for 700 children. Limited to Cumberland architects. Plan of site and conditions from W. D. P. Field, Secretary, Education Committee, Town Hall, Whitehaven. No statement as to premiums or deposit.
Dec. 1	POSTER FOR BUILDING EXHIBITION, OLYMPIA, April 17th to May 1st, 1909. Premium £105. Open to Architects and Architectural Students only. Particulars and entry forms from H. Greville Montgomery, M.P., Exhibition Offices, 43, Essex Street Strand, London.
Dec. 14	BLACKPOOL. CENTRAL PUBLIC LIBRARY.—Premiums of £52 10s., £31 10s. and £21. Particulars and site plan from T. Loftos. Town Clerk, Town Hall, Blackpool. Deposit £1 1s.
Dec. 19	WHITTINGHAM. ANNEXE TO ASYLUM FOR PAUPER LUNATICS, for the Lancashire Asylums Board. Limited to Architects who are in practice and are ratepayers in the County of Lancashire. The new building is to accommodate 700 Inmates. Premiums of £100, £50, and £25. Particulars and plan of site from Leonard Colman, Law Clerk to Committee of Visitors, 8, Lune Street Preston. Deposit £5 5s.
Dec. 31	CORNWALL COUNTY OFFICES.—Designs and *Estimates* invited Premiums of £50, £20 and £10. Premium for successful design to merge in Commission. Particulars from C. L. Cowlard, Clerk to County Council. Bodmin. Deposit, £1 1s.

* *This competition has been unfavourably reported upon by a Correspondent.*

The Ilford Emergency Hospital Competition.

The designs submitted in this competition were exhibited on the 8th and 9th inst., but pressure on our space has prevented us, up to the present, from drawing attention to the fact that the selected design departs considerably from the conditions laid down in the original conditions, and also in the supplementary answers to questions from competitors.

The Ilford Emergency Hospital must be classed among the already heavy list of mismanaged competitions. The Governors first of all appointed a doctor to be assessor, and we presume that the original conditions were drawn up by him. Under pressure from the R.I.B.A., the Governors agreed later to appoint an architect assessor in conjunction with the doctor, but the latter withdrew, leaving the nominee of the Institute, Mr. H. Percy Adams, F.R.I.B.A., to assess the competition alone. That Mr. Adams had no very high opinion of the original conditions is evidenced by the remark, in his report:—"I think it a little unfortunate that the instructions to the architects were not more explicit in some details, and a little less vague in others; and I think a quite unnecessary amount of work has been imposed upon the competitors." How

Mr. Adams decided to assess the competition we have no means of knowing; he acknowledges having read "the instructions issued to competing architects and the answers sent to their questions." This seems to prove that he had nothing to do with drawing up the original instructions, or answering the very formidable list of questions received from competitors as a result of the defects in those instructions.

It would seem, however, that the assessor either decided that the original instructions were valueless, and therefore proceeded to select what he considered the best design; or that, recognising that the sum the Governors desired to spend was hopelessly inadequate, he selected the design that, being generally meritorious, was most economical. In either case, we cannot but think that the decision grievously wrongs those competitors who endeavoured to comply with the ideals of the original assessor.

To take just a few of the discrepancies between the selected design and the instructions:—

(a) It was desired (but not obligatory) to have the wards on one (the ground) floor. The selected design has them on two.

(b) The floor area per bed in the wards was fixed as "not less than one hundred and thirty-three feet." This allowance was queried as unusual and excessive, but was affirmed. "The assessor says it may be unusual, but it is not excessive." The selected design allows 118 square feet.

(c) Sculleries were stipulated for in addition to the nurses' duty rooms. The selected design omits these.

(d) Four rooms were required for the two medical officers—presumably two bedrooms and two sitting-rooms. The selected design gives three rooms only—two bedrooms and one sitting-room.

(e) The board-room was required to accommodate thirty people. The selected design provides a room 20ft. 6in. by 18ft., which hardly seems sufficient for the purpose.

We do not wish to be misunderstood in this matter. We do not contend that the selected design is a bad piece of planning; on the contrary, the assessor himself, well-known as an expert and experienced hospital planner, says the design "is admirably worked out," and any required modifications "could easily be effected by so skilful a designer." But what we do wish to say is that this selected design deliberately disregards a number of the conditions laid down, however unreasonable or unsatisfactory they may have been; and if, as seems probable, the assessor regarded them as unsatisfactory, we think he should have drawn the attention of the promoters to that fact upon his appointment. It would then have been possible either to amend or redraft the conditions; or to select a limited number of the best designs sent in for a second competition under revised instructions and conditions. In any case, it was wholly unwise and inadvisable for architects to enter a competition for which no professional assessor had been appointed: and to that extent the disappointed competitors have themselves to blame.

Building Exhibition Poster.

We have pleasure in drawing particular attention to the competition for a poster for the Building Exhibition at Olympia, April 17th to May 1st, 1909, which has been instituted by Mr. H. Greville Montgomery, M.P. The competition is open to architects and architectural students only. Mr. Ernest George, Pres. R.I.B.A., Sir Aston Webb, R.A., and Mr. George Frampton, R.A., are the judges.

MANCHESTER AND SHEFFIELD SOCIETIES OF ARCHITECTS.

The Kalendar for 1908-9 of the Manchester Society of Architects contains the forty-fourth annual report, in which it is shown that the Society consists of 109 Fellows, 89 Associates, and 59 Students; total, 257. In addition to the opening meeting, which occurred on October 8th, when the presidential address was delivered by Mr. Paul Ogden, F.R.I.B.A., the syllabus includes the following arrangements:—November 12th, Mr. C. Clement Hodges, on "Norman Architecture in the Northern Counties of England"; December 10th, Mr. Edward S. Prior, M.A., F.S.A., on "English Parish Churches, chiefly of the Fifteenth Century"; January 28th, Mr. Arthur T. Bolton on "The Dome as the Basis of an Architectural System"; February 12th, Professor Beresford Pite, M.A., F.R.I.B.A., on "The Growth of Design and Craftsmanship in English Masonry and Woodwork"; March 11th, discussion on students' drawings. Twenty-nine prizes are offered to students for drawings, sketches, designs, and an architect's note-book.

The annual report—the twenty-first—of the Sheffield Society of Architects and Surveyors states the membership at 123, as compared with 121 last year. The programme for the session includes, besides the president's address, which was given at the opening meeting on October 8th, the following arrangements:—December 11th, Councillor John S. Nettlefold, of Birmingham, on "Housing Reform and Town Planning"; February 11th, 1909, Professor C. H. Reilly, M.A., on "The Grand Manner in Architecture"; March 11th, Mr. Temple Moore, F.R.I.B.A., on a subject to be announced. The lecturer and subject for a general meeting that is to be held on January 14th are not yet announced. The annual meeting is to be held on April 8th.

ROYAL COMMISSION ON ANCIENT MONUMENTS.

The King has been pleased to appoint a Royal Commission to make an inventory of the ancient and historical monuments and constructions connected with or illustrative of the contemporary culture, civilisation, and conditions of life of the people in England from the earliest times to the year 1700, and to specify those which seem most worthy of preservation. The Commission is constituted as follows:—Lord Burghclere (chairman), the Earl of Plymouth, Viscount Dillon, Lord Balcarres, Sir Henry Hoyle Howorth (president of the Royal Archæological Institute), Sir John Francis Fortescue Horner, Mr. E. J. Horniman, M.P., Mr. Francis John Haverfield, LL.D. (Camden Professor of Ancient History in the University of Oxford), Mr. Leonard Stokes (vice-president of the Royal Institute of British Architects), Mr. James Fitzgerald (assistant secretary to the Office of Works), and Mr. J. G. N. Clift (hon. secretary to the British Archæological Association). The secretary of the Commission is Mr. George Herbert Duckworth, 35, Charles Street, Berkeley Square, W.

THE ARCHITECTURAL PROFESSION OF TO-DAY.—VI.

In the brief references, occurring in our former articles, to the over-crowded state of the profession, no attempt was made to discriminate between the various component influences which have brought about the unfortunate congestion from which architectural practitioners are now suffering. But, after careful study of the old and ever-recurring problem of cause and effect, we have arrived at the conclusion (which we fear will not be palatable to some architects) that the constant increase in the number of applicants desirous of becoming members of the architectural fraternity is due, in a very large measure, *to an initial mistake made from within the profession itself*. We allude to the latent weaknesses observable in the scheme of examination qualifying for registration, as probationer and student, and for candidature as Associate, prepared under the auspices of the Royal Institute of British Architects, which has now been in operation for many years. Notwithstanding the disorganised condition of the architectural profession, there is not, and so far as we are able to judge there never has been, any cogent reason why architects, to their own detriment and undoing, should have persisted, for so long a period of time, in the policy of assisting and encouraging undesirable students to enter the ranks of the profession. Yet the examinations of the R.I.B.A. seem to be framed, almost exclusively, with this very object. To put it briefly: the examinations, qualifying respectively for the grade of probationer, student, and Associate, and known as the Preliminary, the Intermediate, and the Final, are in no instance of a *sufficiently severe, thorough, or exacting nature*. For example, under the scheme of professional qualification now in vogue, it is possible for an architectural student of the immature age of twenty-one year to pose—by virtue of the Associateship of the R.I.B.A.—in the eyes of the public, as a fully qualified architect! How many medical men, how many lawyers, are permitted to commence practice (or in other words to complete their education, at the expense of the public) at that age? Further, have we not often been told, by past presidents of the R.I.B.A. and other prominent members of the architectural profession, that a good "liberal education" and a considerable degree of "culture" are *essential* to the welfare of every architect? Yet, under the ridiculous scheme organised by the R.I.B.A. for testing the qualifications of the architectural student, no provision *whatever* is made for examining him in these "essentials." We learn that the examinations "have been so arranged as to induce the gradual development of artistic and scientific powers to secure a systematic training in the art and science of architecture from the entry into an office until the commencement of actual practice."

We are also told that "they afford guidance in professional studies, and opportunities for testing, at well-marked intervals, the progress made." So far, so good, for, theoretically at least, the views expressed by the organisers of the examination scheme—up to this point—are excellent. Unfortunately the concluding paragraph of the preamble is not so satisfactory, albeit its frankness is highly commendable.

It informs the student that "a *minimum* standard of knowledge may be thus attained by all who enter the profession, serving as a basis for future studies, necessary to the fuller development of architectural ability." But it does not tell him how, under the operation of his scheme of examination, he has to obtain the requisite leisure to perfect himself in the "essentials," viz., "culture" and advanced education. Let us examine, stage by stage, the details of the scheme for testing, by "progressive examinations," the systematic course of education" to which reference is made; although, so far as we know, *no* systematic course of education of a thoroughly sound nature is at present to be obtained within the boundaries of the United Kingdom.

In the Preliminary Examination, framed with the object of testing the general knowledge of candidates in ordinary subjects of school education and other subjects described as being of a "technical character," such as elementary mechanics and physics, geometrical drawing, perspective and freehand drawing, from the round, the "minimum standard of knowledge" required has assuredly been fully maintained. We are aware that it is intended that the subjects comprised in this first examination should be studied by the would-be architectural probationer before he enters an architect's office; in other words, it is considered that this remarkably easy examination is in itself a sufficient test of the embryonic architect's possession of the requisite "general education" and "culture." A very brief examination of the syllabus suffices to prove that, as a matter of fact, it is nothing of the kind. With perhaps the possible exception of the one hour's examination in English composition, the scheme of examination (*final* as far as any test of "general education" and "culture" is concerned) appears to be one that it would be not unfair to expect the average schoolboy of 14 or 15 to pass *without* any special preparation whatever. But, apart altogether from the question of the efficiency or otherwise of the test sought to be imposed by the examination, we should like to know who is responsible for the inanities of its curriculum. For example, why should the candidate's historical researches be restricted (in the case of the history of his own country) to the period commencing "with the Norman Conquest and ending with the extinction of the Tudor dynasty," or why, regard being had to the close connection between the history of architecture and the general political history of the world, does the examination offer no encouragement to the young architectural student to obtain a sound and comprehensive knowledge of the progress of civilisation and the consequent evolution of art? Surely this subject is one of the *first* importance to the man who is expected to aspire to the attainment of a considerable, or indeed to any degree of "culture?"

We are glad to hear, although we confess that in the course of our experience we have not had occasion to become greatly impressed with the necessity, that "clear and well-formed handwriting, correct spelling, and grammar and punctuation are indispensable to the architect," but our very soul revolts at the degradation inflicted upon the man of "culture" by requiring him to "write out" and punctuate a short passage read by the examiner. If it be alleged that this preliminary examination is only intended to be one of a nature that the ordinary Council school boy might be expected to pass, we may well ask how men of "culture" and "liberal education" are to be attracted to a profession whose obligatory entrance examination is one of so elementary a nature? In any case, whilst the preliminary examination remains in its present state (and thus admittedly throws the door of the profession wide open for the reception of illiterate students), the great leaders of their profession might reasonably be expected to cease to draw attention to the difference observable between their precepts and practice by discontinuing their demands (on behalf of the architectural profession) for the acquisition of cultured and well-educated recruits.

Strangely enough, although the architectural profession has proved itself incompetent to deal efficiently with the great subject of the general education of the future architect, yet it is, apparently, determined to oppose any educational movement emanating from outside designed *inter alia* to further that end. Thus, when the University of Cambridge produced its well-meaning, but not altogether satisfactory, scheme for founding a school of architecture, the proposal was opposed in a most intolerant and bigoted manner. The disapproval of that august body, the Board of Examiners of the R.I.B.A. was upheld and strengthened(?) by the appearance, in *The Times*, of some very voluminous and silly letters on the subject, contributed by three "eminent" architects whose arguments, if we understood them rightly—and they were so enshrined in verbosity that it is conceivable we may not have done so—were to the effect that an architect should be a man of the highest education and culture, that uner the proposals put forward by the University Syndicate undergraduates intending to take their degree in architecture, necessarily could not receive the *best* possible *general* education, and *therefore* it was the duty of the profession to oppose the movement. It seems remarkable that whilst these doughty opponents of the University's proposal formerly held such "advanced," not to say absolutely unpractical views, they should now be content to fall into line with the present examination scheme of the R.I.B.A., under which their former *sine qua non*, i.e., "the best possible general education," has been absolutely abandoned, for no one can say that evidence of the possession of even a modicum of general culture is required from the candidates offering themselves for the preliminary and, so far as their general education is concerned, the *final* examination conducted by the R.I.B.A.

After remaining thirty years almost a ruin, the historic church house at Crowcombe, Somersetshire, has been completely restored, in keeping with the ancient character of the building, at a cost of £550. The upper floor has been adapted for the parish room and the men's institute of the parish. At the opening ceremony the Ven. Archdeacon Askwith, of Taunton, said in the history of that parish they could look back to the year 1246, when Godfrey de Crocumbe gave to the Prioress of Studeley, Oxfordshire, the revenue accruing to him in connection with the church house.

Notes and News.

The jubilee of "the finest parish church in England" (it would not be surprising to hear that there are several to dispute this proud claim), that of Doncaster, has just been celebrated. Doncaster's first parish church was built at the beginning of the thirteenth century. It was burned down in 1853. A year afterwards, the foundations of the present church were laid, and the building was completed and opened on October 14th, 1858. It cost £43,000, and was built from the designs of Sir George Gilbert Scott, R.A.

* * *

Sheffield's new city architect, Mr. F. E. P. Edwards, is to have a staff of eleven persons, of whom five are being transferred from the architectural staff of the city engineer's department, and five from the building department at the Education Office, while Mr. G. E. Whitaker, of Bradford, is to be chief clerk. Mr. T. W. Newbold, of the city engineer's staff, is to be the city architect's chief assistant.

* * *

The Northern Architectural Association, of Newcastle-on-Tyne, has now entered upon its fiftieth session, and, in order to celebrate the occasion, it is proposed to hold a dinner, at a date not yet fixed, and to invite the presence of distinguished architects and others as guests. It is also proposed to hold an exhibition of architectural drawings, etc., illustrating the work executed during the last fifty years, with special reference to the district covered by the association.

* * *

During the course of a presidential address at the Architectural Craftsmen's Society in the Technical College, Mr. J. Campbell Reid, A.R.I.B.A., expressed the opinion that the present-day architect is far more skilful in the planning of buildings with regard to health, convenience, and comfort, than his confrère of any previous generation. The desire of the public to obtain a maximum of building at the minimum of cost has a depreciative effect upon architectural embellishment. Mr. Reid believes that the rudiments of architecture should be taught in schools, and that until the public are educated to realise the best, mediocre architecture is inevitable.

* * *

It appears that the further construction of skyscrapers in New York is to cease. The New York Building Code Revision Commission intends recommending the limitation of future buildings to a height of 15 storeys. It is anticipated that the proposed reform will be met with opposition chiefly in the business area at the lower end of Manhattan Island, where lateral extension is prevented by the Hudson and East Rivers, and the harbour.

* * *

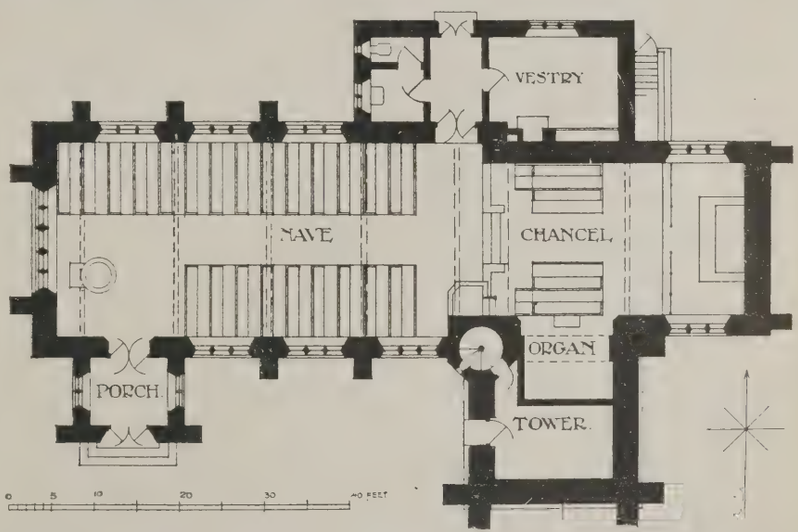
Excavations in the Forum at Rome are now going on in front of the Arch of Titus, with the object of tracing the remains of the fortifications of the sixth century after Christ—the period of the great struggle for Rome between the Byzantine Empire and the Goths. Signor Boni has already found a great number of clay vessels and fragments in the trench which he has opened there, and it is hoped that these investigations may furnish a new and valuable clue to the little-known social history of the Gothic period.

PRIZE DESIGN FOR A VILLAGE CHURCH. W. ARTHUR RIGG, ARCHITECT.

This is a perspective view and plan of a design for a small village church on a sloping site. The tower has a stone staircase to belfry and roof, and is so arranged that the bottom portion serves as organ chamber. The clergy and choir entrance may be used as an emergency exit. There is a heating chamber under the vestry. The walls are of local squared rubble, with freestone quoins and dressings, with tiled roof. The design is by Mr. W. Arthur Rigg, and is one of two with which he won the Donaldson Silver Medal at University College, Gower Street, last session.

The monument to the late Crown Prince Rudolf was unveiled at Budapest, on October 10th, by the Emperor Francis Joseph, who personally expressed his thanks to M. Molnar (Secretary of State for Public Instruction) and to M. Ligeti, the sculptor.

* * *



Spray baths for an elementary school have been decided upon by the Norwich Education Committee. The cost of the experimental installation will be £300, and maintenance is estimated at £105 per annum. Three batches of children will pass through the baths in an hour, so that 80 can be dealt with in a day, or 400 per week. Dressing-rooms will be provided, and the bath divided so as to deal with ten children at a time. No other elementary school in the country has yet had an installation of the kind, so that there is no experience to guide the committee, but the scheme was strongly recommended by the newly appointed school medical officer, Dr. Mathieson, who explained that in a spray bath the water falls in a shower upon each child, and immediately runs away by the waste pipe, removing any chance of infection.

* * *

Mrs. E. A. Freeman has presented to Manchester University a collection of pen-and-ink sketches of English and Continental churches by the late Professor Freeman. These will be placed in the Freeman Library, where they may be seen by anyone interested.

* * *

The "Air-pit Fire" (Sherwin's patent) is explained and illustrated in a booklet that has been sent to us for notice by Mr. W. B. Clarke, of Saracen's Head Buildings, Snow Hill, E.C., who is, we understand, agent for the manufacturers.

Messrs. Sherwin and Cotton, of Hanley, Staffs. Nearly fifty patterns are shown, and the makers undertake to supply special designs and to work to architects' orders.

* * *

Mr. F. Bennett Smith, F.R.I.B.A., of 17, Brazenose Street, Manchester, informs us that he has taken sole charge of the practice in which he formerly had for a partner the late Mr. Alfred Darbyshire, F.R.I.B.A., and will continue it under the style of Darbyshire and Smith.

* * *

Vulcanite, Ltd., manufacturers of patent Vulcanite roofing and sheet asphalt for roofing, sarking, and dampcourse, 118, Cannon Street, London, E.C., Old Ford, London, E., and Laganville, Belfast, inform us that their Manchester address is now 41, Corporation Street, and not as formerly.

* * *

At the fortnightly meeting of the Brampton Rural District Council, Lady Carlisle moved that the final approval of all building plans be submitted to the Council. She explained that at present the building surveyor did not forward plans until they complied with the by-laws. She desired to enable builders to appear before the Council to state any hardship that might arise. The Council could then waive certain points if they thought fit, which at present the building surveyor could not do. At present the Council did not get the plans until the building surveyor certified that they were in strict conformity with the by-laws. After discussion, the matter was adjourned.

Proposed New Works.

The Local Government Board has decided to hold, or has recently held, as the appended dates may indicate, inquiries into proposed expenditure by public bodies as follows:—Water supply works and plant: Okehampton R.D.C., £1,000 for South Zeal, Ramsley, Shelley, and Prospect (October 22nd); Ampthill and Newport Pagnell R.D.C., £7,700 and £4,973 for Aspley Guise, Aspley Heath, and Woburn Sands (including the construction of a reservoir wtih a capacity of 390,000 gallons, etc., at Bow Brick Hill) (October 20th). Electric lighting and power supply works and plant: Watford U.D.C., £1,830 (October 20th); Nuneaton B.C., £2,500 (October 21st). New bridges and renewals: Salford B.C., strengthening Palatinit Bridge, u.a.s. (October 21st). Street improvements, new roads, public walks, and pleasure grounds: Mansfield B.C., £1,080 (October 20th); Hanwell U.D.C., £320 and £5,400 (October 20th); Wollaston R.D.C., £500 for cemetery (October 24th); Nuneaton B.C., £4,300 (October 21st). Sewerage, drainage, and sewage disposal works and plant: Wolstanton United U.D.C., £7,000 (October 23rd); Mold U.D.C., £3,500 (October 22nd); Brentford U.D.C., £4,794 (October 23rd); Mossley B.C., £9,000 (October 22nd); Mansfield B.C., £36,718 (October 20th); Wembley U.D.C., £1,000 for storm water filters (October 22nd); Richmond (Surrey) B.C., £5,350 (October 21st); Hoddeston U.D.C., no amount stated (October 21st); Hanwell U.D.C., £1,350 (October 20th); Uphill R.D.C., £1,300 for Weston-super-Mare (October 21st); Chelmsford B.C., £1,093 (October 20th); Ampthill and Newport Pagnell R.D.C., £7,224 and £4,774 for Aspley Guise, Aspley Heath, and Woburn Sands (October 20th); Bacup B.C., £2,525 and £645 (October 21st).

Acton.—The Local Government Board has given its sanction to the borrowing of the following amounts for public works at Acton:—£5,000 for new sewerage works, £4,700 for acquiring further properties in connection with the Acton Improvement Act, £18,098 for the erection of new schools at Acton Vale, £1,135 for furniture and fittings for those schools, and £20,600 for new public offices.

Bolton.—The Corporation have accepted the offer by Mr. Andrew Carnegie of three branch libraries at a cost of £5,000 each.

Broadstone, Dorset.—It is proposed to add an aisle and enlarge the vestry of the parish church (St. John the Baptist), at a cost of about £700.

Burslem.—Plans for a new central school in Moorland Road have been prepared by Mr. A. R. Wood, and approved by the Town Council.

Camberwell.—The Borough Council have accepted the estimate of the borough engineer (£1,500) for the erection of seven cottages in Pitman Street.

Cardiff.—An enquiry has been held at the City Hall, Cardiff, with regard to an application for a further loan of £45,000, to defray extra costs in connection with the new City Hall and Law Courts, and also for approval of the sale of the old Town Hall and municipal buildings, to the Co-operative Society, Ltd., for £60,000. The matter is to be reported to the Local Government Board in due course.

Dundee.—Foundation stones of the new physics and electrical engineering laboratories at Dundee University College, which are estimated to cost about £16,500, were laid on October 11th.

Eastbourne.—The church of Holy Trinity is to be enlarged and completed, at an estimated cost of £7,000.

Edinburgh.—The governors of George Heriot's Trust have decided to accept the offer by the War Office to purchase the estate of Redford, near Edinburgh, for the erection of cavalry barracks. The price is £15,500.

Golder's Green, N.W.—A new church is proposed for this rapidly growing district. Mr. Wills has been appointed architect, and tenders are to be invited as soon as the necessary plans have been prepared and passed. The site in North End Road has been presented to the vicar by the Ecclesiastical Commissioners.

Great Crosby.—At a recent meeting of the Urban Council, the following plans were approved:—Plan of detached villa on the west side of Coronation Drive, for Messrs. Lawson and Rimmer; plan of three pairs of houses on the east side of Sherwood Road, for Mr. W. Wright; amended plan of drainage to the Great Crosby elementary schools, for the County Council; drainage plan of two houses on the north side of Moor Lane, for Mr. Charles Townsend.

Harrogate. — Chancellor Tristram, K.C., D.C.L., conducted a Consistory Court at St. Mary's Church, Harrogate, on October 14th, when a petition was presented for the building of a new church at Westcliffe Grove and Harlow Terrace. The petition for a faculty for rebuilding was presented in consequence of the old church having been condemned by the Harrogate Corporation as unsafe. The faculty was granted.

Hereford.—Improvements to the church of St. Nicholas, at an estimated cost of £1,300, are in contemplation.

Ilford.—At a recent meeting of the Ilford Urban District Council, plans and estimates for a dust destructor were submitted by the surveyor (Mr. H. Shaw). The estimated cost, with the necessary buildings, is £15,000, and it was decided to apply for sanction to borrow £8,115 for the erection of the buildings.

Kingston-on-Thames.—Owing to the continued delay in taking steps for the widening of Kingston Bridge, the Kingston Corporation have requested the local member to draw the attention of the Surrey County Council to the matter. The widening has been under discussion now for several years.

Leeds.—Mr. Edgar Dudley, an inspector from the Local Government Board, held an inquiry at the Leeds Town Hall on October 14th with respect to applications by the Corporation for leave to borrow £48,000 for the purchase of Kirkstall Grange and part of the estate for the purpose of a training college, and to borrow £8,022 for street improvements.

Newport, Mon.—Two blocks of artisans' dwellings are to be built here, at an estimated cost of £1,400.

Newport, Mon.—For the erection of a technical institute here, the Education Committee have accepted the tender of Mr. W. E. Blake, Plymouth—£36,130.

Newquay, Cornwall.—A scheme has been inaugurated to build a new church here, at a cost of £10,000, to seat 1,000 people. A site has been secured for £545, and it is proposed to build the nave section first, which is estimated to cost £5,000.

Scarborough.—At a meeting of the Town Council, the borough engineer having submitted a plan showing the construction of an apron to the damaged portion of the Marine Drive sea-wall, leaving spaces where excavations could be made into the shale, if necessary, and an estimate of the cost of such apron amounting to £2,000, it was resolved that such plan and estimate should be approved, and that the borough engineer should proceed with the work forthwith.

Southampton.—The foundation stone of a new sailors' home here was laid on October 15. The building has been designed in Georgian style by Mr. A. F. Gutteridge, of Southampton. Mr. W. E. Blake, of Plymouth, is the contractor.

Tipton.—Mr. W. A. Ducat held a Local Government Board inquiry, on October 13th, with reference to an application by the District Council to borrow £1,000 for extension of the public offices.

Wallasey.—The U.D. Council are looking for a site for their Carnegie Library.

Wilmington, Kent.—The old Parish Church, part of which was erected in pre-Norman days, is in need of urgent repair, the tower especially, which is the oldest portion, being unsafe. Mr. Robert Marchant, A.R.I.B.A., has prepared a survey of dilapidations, and funds are to be collected, the work being started immediately.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible.
The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.
The querist's name and address must always be given, not necessarily for publication.

Architects' Responsibilities to Clients.

LEEDS.—R. S. writes: "A contractor (joiner) receives notice under Clause 26 of the R.I.B.A. contract form, that owing to his default the work of completing his contract will be taken from him and given to another contractor. The justice of this is not questioned. The first contractor A has given to the architect on signing a priced schedule in compliance with special condition in contract. The architect certifies strictly according to these prices, and when the contractor A is turned off, has certified for £160, whilst the work done priced on the above schedule comes to £250. The rate of payment inserted in clause 30, R.I.B.A. form, is 80 per cent., but, owing to the defective character of the work, the architect withheld the additional amount. The cost of repairing and making this work satisfactory has amounted to, say, £50, leaving £40 nominally due to contractor A. The new contractor brought on to the job at the request and recommendation of the proprietor, completes the work satisfactorily, but at much great cost, so that when completed the building costs the proprietor, say, £100 more than the amount of the original contractor's estimate. It will be seen that in certifying the architect has in hand, so to say, £40 when the contractor A is dismissed after repairing his bad work. The prices in all cases being based on the above schedule, presumably this shows sufficient care on the part of the architect. The proprietor, who considers himself a judge of such things, informs the architect that contractor A is, in his (the proprietor's) judgment overpaid, and he will claim some indefinite amount from the architect (who has all measurements of material in job priced according to

TOWN HALL CHAMBERS, 374—8, OLD STREET, LONDON, E.C. LOVEGROVE AND PAPWORTH, ARCHITECTS.

schedule), and will also claim from the architect damage for delay owing to the trouble with contractor A, although he has previously admitted in his letters that the contractor has caused the delay. (*a*) Will the priced schedule stand good, and has the architect acted correctly—*i.e.*, will he, under these conditions, be considered to have certified correctly and not excessively? (*b*) To whom should certificates be made out? The architect has given ample personal inspection to the work—in fact, more than was really necessary. (*c*) Is there any claim whatever on the architect?"

The proprietor should recollect that the building contract is between himself and the builder (or builders), and that the architect is not in any way a party to that contract. The architect is engaged by the proprietor to execute certain duties; and provided he carries out those duties honourably, and is guilty of no negligence, he is under no personal liability whatever. To make him liable for damages, the proprietor must prove either fraud or negligence on the part of the architect, and in my opinion there can be no question of either charge being justly made under the circumstances detailed. The answers to your queries are therefore (*a*) Yes, (*b*) Yes, (*c*) No. F. S. I.

Best Book on Materials.

LONDON.—N. H. C. writes: Can you advise me as to the best technical book dealing with materials?

Rivington's "Notes on Building Construction," vol. iii.

Our Plate.

Town Hall Chambers, 374-8, Old Street, E.C., has been erected by the owner, employing direct labour, and is of fire-resisting material throughout. The street front is faced with sand-faced red bricks, the arches and aprons being in brighter coloured gauged brickwork and Portland stone dressings. The building is let off as offices, each floor being divided differently to suit the tenants' requirements, the irregular frontage to Loyne's Buildings generally dictating the arrangement of the rooms. The cost was 8¾d. per foot cube. The architects were Messrs. Lovegrove and Papworth, of 374-8, Old Street, E.C.

LONDON FACTORIES RECENTLY ERECTED.

A correspondent having asked for a list of the factory premises that have been erected in or near London during the past year or so, we referred the question to the Factory Department of H.M. Home Office, and have been favoured by Mr. Knyvett, H.M. Superintending Inspector, with the following reports, which have been prepared by various district inspectors, and which are published in the belief that the information may be found useful by others besides the correspondent at whose request it has been obtained. The list may be taken as being representative rather than complete.

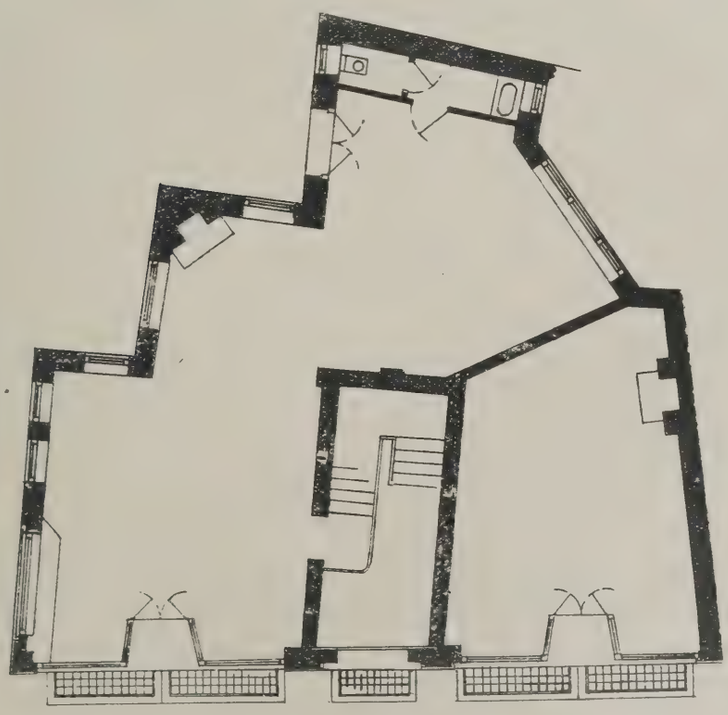
North London District.

Eagle Pencil Co., Tottenham Hale, Tottenham, N., pencils; Cadett and Neale, Ltd., Wealdstone, Middlesex, dry plate; Caley and Co., Ltd., Chenies Street, W.C., mineral waters; The White Co., Carlow Street, Arlington Street, N.W., motor cars; Metropolitan Railway Co., Neasden, N.W., electricity; Stavers, Messrs., Angel Road Edmonton, N., sawmill.

South London District.

Moore and Nettlefold, Anchor and Hope Lane, Charlton, glass bottles; Kirby and Sons, Peckham Grove, Camberwell, corsets; Hayes and Sons, Coldharbour Lane, Lambeth, laundry; Harvey and Co., Kenbury Street, Lambeth, bookbinding; Cross and Blackwell, Ltd., Nine Elms Lane, Lambeth, preserves.

West London District.



Line and Sons, Ltd., Southall, wall-paper manufacturers; The Gramophone Co., Ltd., Hayes, gramophone records; Horlick's Malted Milk Co., Ltd., Slough, malted milk; The Direct Supply Aerated Water Co., Ltd., 135-137, Fulham Palace Road, S.W., aerated waters; Renault Frères, Ltd., Seagrave Road, S.W., motors; The "Morning Post," Strand, W.C., newspaper production; S. Oborne and Co., Warple Way, Acton, printing, etc.

North-East London District.

Three new repair sheds for motor omnibuses—London Road Car Co., Ltd., Redclyffe Road, Upton Park, East Ham; Great Eastern London Motor Omnibus Co., Ltd., Lea Bridge Road, Leyton, and also at 234, Green Street, Upton Park, West Ham. Several large firms in this district are greatly increasing their works. The Co-operative Wholesale Society, Ltd., have erected a soapworks at their group of factories off the North Woolwich Road at Silvertown, in West Ham; J. Rank, Ltd., and W. Vernon and Sons, are doubling their flour-mills at the Victoria Docks; Conrad Schmidt, Carpenter's Road, Stratford (paints), has acquired large premises adjoining present factory, which will no doubt double original capacity. There are three small new places of a rather unusual character which it may be worth while to mention, namely, Dusmo, Ltd., West Ham Lane, Stratford, dust-laying material; Dustabaters, Ltd., Hartmann Road, Silvertown, dust-laying material; and Cast Iron Brazing Co., Station Street, Stratford, engineering repairs. The Lamson Paragon Supply Co., Ltd., have found it necessary to remove the carbon paper branch of their work to a large new factory in Etloe Road, off Church Road, Leyton. T. W. Ward, Ltd., have abandoned several scattered depots, and concentrated at a large new site off the North Woolwich Road, at Silvertown. Their occupation is the breaking-up of scrap metals. The following five factories are of recent construction: Burgoyne Burbidges and Co., High Street South, East Ham, drugs: London Butchers' Hide and Skin Co., Ltd., Creekmouth, Barking; Midland Cattle Products Ltd., Creekmouth, Barking; British Coalite Co., Ltd., Creekmouth, Barking; Oowana Soap and Candle Co., Ltd., High Street, Stratford, West Ham.

East London District.

Co-operative Wholesale Society, Ltd., Leman Street, E., now in course of construction for coffee, butter-blending, etc.; Princepts Patent Lighting Co., Narrow Street, E., brass foundry; The Micanite and Insulator Co., Blackhorse Lane, Walthamstow, now in course of construction: and a factory near Stoke Newington Station, N.E.

Correspondence.

Relations Between Architects and Insurance Surveyors.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Undoubtedly, as *Audi Alteram Partem* states, instances might be quoted of unsatisfactory treatment of Insurance Surveyors by Architects, and while such treatment is reprehensible either on the one side or the other, may it not be occasioned by some underlying grievance against the action of the Surveyor? The architect, presumably being a conscientious man, is desirous of doing the best for his client, and to this end would gladly consult with the insurance surveyor preparatory to the erection of his building if he thought any benefit would be derived by his client thereby. What are the advantages of such a consultation? A greatly improved fire risk from the insurance man's view, but a negative result so far as the client is concerned. If, as the result of such an interview, it were possible to obtain from insurance surveyors a schedule of rates applicable to certain grades of fire-resistant constructions, then the architect, or at any rate his client, would gladly welcome it, but if it be that the only result is an increased cost of building without a reduction in the insurance, your correspondent can barely wonder that the conferences he suggests are not welcomed. *Audi Alteram Partem* seems to know the insurance surveyor's side, and perhaps he could tell us what benefit in actual insurance rates would accrue to an intending builder if on the one hand he confers with the insurance surveyor, and embodies his suggestions in, for example, a reinforced concrete construction, and on the other hand, without reference to the insurance surveyor, he puts up a building which, while complying with the fire insurance rules, could not be considered as a first grade building from a fire resistant view. The comparison would be all the more interesting if it applied, say to the Cripplegate area.

Yours (from the view of)

THE MAN WHO PAYS.

Art in the Countryside.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Re Mr. Delissa Joseph's letter to the "Times," which you quote in a recent isue, where he advocates the establishment of a Minister of Fine Arts and Local Committees of Taste, with powers to control the design of rural buildings, in order that the country-side may not be disfigured, and incidentally provide hundreds of capable architects with work. The idea, not strikingly novel, is too Utopian for this commercial age. In the first place, the better class country houses are very frequently designed by more or less capable architects, leaving to others those erected for the benefit of aagricultural and poorer classes. We all appreciate the exceedingly difficult problem of providing well-built hygienic cottages to suit the pockets of the latter class and at the same time to bring in a fair return to the building owner. However, if we add to the already arbitrary powers of the Rural Councils, the whims of a Crown Minister, and the fads of a Local Committee of Taste, the cost of adequate rural housing would inevitably rise, and many capable architects would find themselves without the small country jobs they now obtain, and, further, the already overburdened agricultural classes would have to pay an increased rental for the privilege of providing an improved outlook for the artistic few. Should the time be ripe for creating a Minister of Fine Arts, with his attendent satellites of good taste, surely London would provide an excellent field for the exercise of their good offices.

F. C. W.

Thrusts and Moments.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Referring to the detailed explanation, in your issue of September 23rd, of the thrusts and moments given in the answer to query in the issue of July 8th, has not the answer neglected one very important point? The resultant given would be the same if there were no collar beam at B, or if the joint at B were hinged. Would not the resultant thrust depend entirely upon the stiffness of the joint B, or if this point were quite rigid, then upon the elastic deflection of the cantilever A—B and the extension under stress of the collar beam? Of course, the assumption of a frictionless joint at B is on the safe side, but to neglect large factors in order to simplify calculations often means ugly proportions by calling for masses of material in situations where it is really unnecessary and wasteful. Please forgive this criticism, which is not necessarily for publication, but as a guarantee of interest.

PERCY J. WALDRAM.

London, W.C.

[The contention made by your correspondent with reference to the thrusts in a collar-beam truss is, in the main, correct. There is, I believe, no known simple method of calculating accurately the thrusts in a collar-beam truss, and for this reason I preface all the replies to enquiries of this kind with a statement that the stresses and thrusts cannot be found accurately. I would welcome any work on the subject which would clear the matter up. One could, of course, work on the elastic theory of Rigid Arches, but such treatment would be very involved, and would not I think, be followed by the majority of your readers. The method I have adopted, which I agree tends to make the scantlings rather on the large side, is practically to design the truss so as to be strong enough if the walls should yield, and also to design the walls so that they should not yield. Your correspondent states that the resultant given would be the same if there were no collar beam; this is true as far as the maximum thrust on the walls goes, but as regards the truss itself, this is greatly strengthened by the collar beam. If one could please oneself, collar-beam trusses would never be designed, because the calculations are so unsatisfactory. A.]

Unemployment Insurance for Architects' Assistants.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Apart from the question of unemployment itself, is the question of the maintenance of the unemployed, which is, perhaps, of more importance and is fairly easy of solution, if all, or a large percentage of, architects' assistants were unanimous in their interest in and appreciation of the difficulty.

The question presents itself in this manner:—Unemployed assistants must either be maintained (1) by their savings, accumulated whilst in work, (2) If these are exhausted (or non-existent) by their friends, that is to say by charity, or (3) by the ratepayers. If the assistants of the United Kingdom formed an association to promote a system of unemployed insurance, to which every member should contribute, they could then support such of their number as were out of employment or unable to find work.

Such an organisation should prove of great value to employers, for it would involve the creation of unemployment bureaux, and the division of the unemployed into classes in accordance with their capabilities, thus rendering it an easy matter for an employer to find a capable assistant without delay, and leading up to the ultimate exclusion of those assistants who are quite useless. I think it unnecessary and impracticable to mention State aid of any description at the present moment. I believe that architects' assistants have sufficient capital, energy, and intellect to manage their own affairs in their own way and to suit their own convenience without any appeal to any outside influence whatever. I may point out that it is only by means of organised effort that the question of unemployment can be dealt with, and *only* by a thoroughly efficient organisation that it can admit of a solution. This will appear dogmatic to many, but a little consideration will show that the means of dealing effectively with any problem involving thousands of detached units is by association of some kind. Meanwhile we require particulars as to the state of unemployment in the various centres, the number of the unemployed, and, at least approximately, the number of assistants who would be prepared to join such an organisation as I suggest. I should be pleased to hear from anyone interested in the proposal, or its objects, with a view to the formation of a committee to obtain the necessary information, and to consider any proposals for immediate action. I shall be agreeably surprised if I obtain any response to this request, as I do not think that the main body of architects' assistants are sufficiently interested in their welfare as a class (possibly regarding themselves as mere birds of passage destined for a future paradise of lucrative practice), and prefer to rely wherever possible on individual effort; but individual effort has been recognised by every trade and profession (with few and doubtful exceptions) to be a failure in all questions of this nature; and, in the face of the combinations for mutual help and economy continually being formed around us, the anarchic position of the architects' assistant is quickly becoming an anachronism. I feel confident (a confidence based on the experiences of other trades, professions, and industries) that if some such proposal is not adopted voluntarily, architects' assistants will be forced into combination in the near future by sheer stress of circumstances.

ERNEST J. DIXON, A.R.I.B.A.

23, Idmiston Road, Stratford, E.

[We are pleased to give publicity to our correspondent's suggestion, which we trust will meet with a better response than he anticipates. Certainly "the stress of circumstances," of which he writes, is already present. But any suggestion of a combination among architects is greeted with the cry of "trade-union," as if a "trade-union" were something horrible and abominable instead of a very desirable and reasonable development under modern social conditions. We hear praise enough from our leaders of the old trade unions which we call craft gilds, but they will not tolerate the idea of a modern craft gild. It is a reproach to many of our artizans' trade unions that

they are more interested in promoting the financial interests of their members than in producing educated and skilled workmen. But that is no reason why architects should not be enrolled in a modern craft gild of more enlightened aims, while not disdaining those financial matters which their ancient prototypes took due account of.—Editor B.J.]

Experimental Investigation of Materials.

SIR,—I have read with great interest the article, in the last Concrete and Steel Section of THE BUILDERS' JOURNAL, on "Theory and Experiment." I must agree with the author when he says that the number of persons engaged upon experimental work, in connection with the materials and methods of construction used in building, is small. But I cannot agree with him when he says that "Insufficient means are provided for experimental investigation." There are very few districts in London, and very few towns in the provinces that are not provided with technical colleges, and many of these, particularly in London and in towns like Birmingham and Leeds, are very completely equipped for carrying out experiments to determine the physical properties of materials. It is not because the heads of the engineering departments of these colleges are "mechanical or electrical engineers" that research work of this kind is not undertaken, but because there are so few students who take enough interest in the work to come forward and do it. The trouble is not to induce the authorities to lend their laboratories to the building students, but to induce the students to use the laboratories. When I read the paragraph in which the writer of the article advises the members of the architectural and civil engineering professions to go to the head of the college engineering departments and instruct them in what to look for, I was astonished; it would be very interesting to know how many members of the architectural profession could go to the professors at, say, the City and Guilds Institute, or University College, and tell them what they should look for in experimenting, for instance, with a buckled plate with fixed edges, to discover the principal stresses and their direction.

For the past five years I have been a student at a London Engineering College, one of two "building" students amongst about two hundred mechanical engineering students, and we have the unrestricted use of the whole of the apparatus in a very completely equipped testing laboratory, which includes a Buckton Wicksteed testing machine with autographic recorder, Ewing's extensometer, deflection microscopes, and a complete testing equipment for cement, as described in the specification of the Engineering Standards Committee. There are about one hundred and fifty students attending lectures in building construction at this college, but I have not seen one of them in the testing laboratory during the whole of the time I have been a student there, and this I think is the condition of things in nearly all technical colleges. The lecturers in Building Construction prepare their students for the Board of Education examinations in this subject, and this body require so much time to be spent in drawing and theory that there is no time for practical experimental work, and until they require a certain number of hours' laboratory work as an essential part of the course to gain a certificate in each stage, so long will the majority of architects and builders in this country remain without a practical knowledge of the physical properties of the materials that they use.

Plaistow. G. N. KENT.

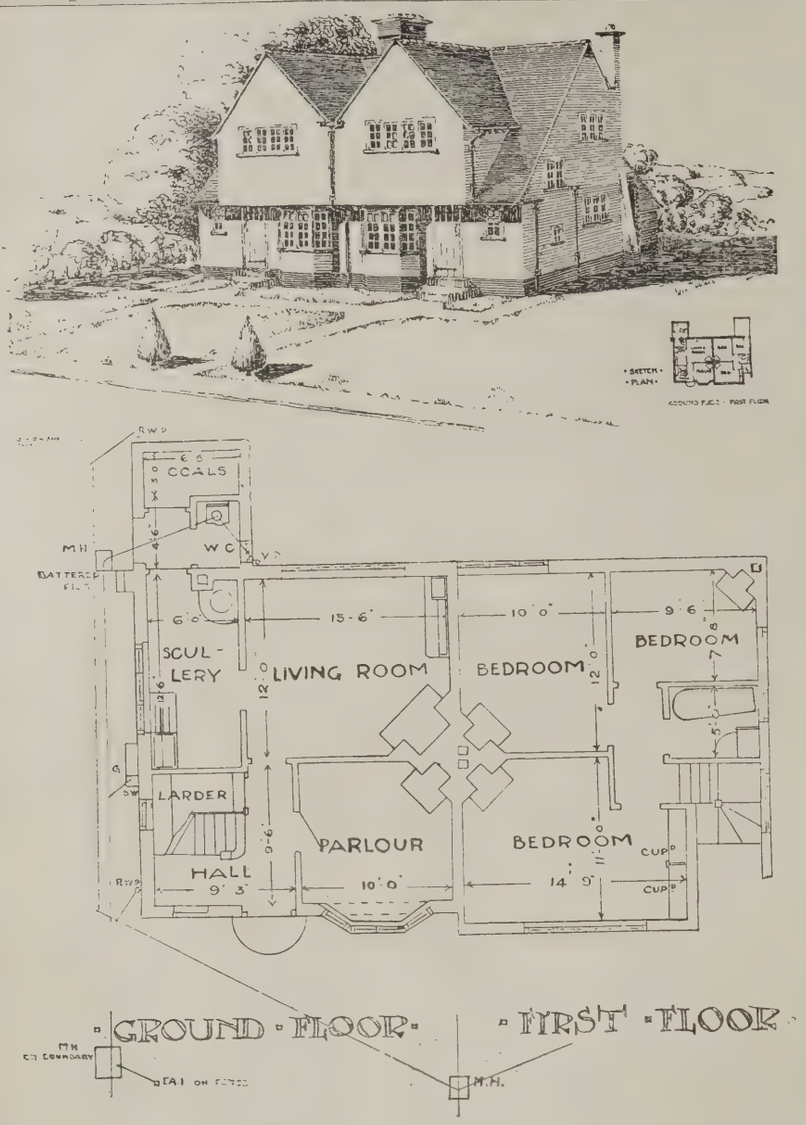
The Architectural Profession To-day.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In order to bring about union in the architectural profession, and avoid jealousy and other factors of disunion, why not begin at the bottom and work up, instead of waiting for the word from the shining ones at the top? Out-of-work architects and assistants would gladly subscribe their signatures to a broadly-worded declaration to help on work of reform in the profession, and others would also, no doubt, join in the face of such universal depression. There are few who would not favour reform. The campaign would be conducted after the manner of other campaigns, but for the purpose of sifting out those who would not be a source of strength to the movement, each member would bind himself to work for the cause, and would have to send a periodical report to headquarters. Every member not working would be struck off the rolls. An official organ would be run in order to keep members all in touch. The moral force of such a body of men would be very considerable. The method of working would be for members to bring their cause before at least one suitable person in a given time, and as a test get him to become a subscriber to the official organ. This would serve to keep those won, and enable members to get introductions or other help from them when needed. Councillors and all those having the power of passing plans, etc., would be the chief people to approach, but many others of the public would also be useful. Then the Union would also direct its attention to all and sundry minor matters connected with the profession, and thus deal with the matter piecemeal till the whole matter had been dealt with. For instance, the local bye-laws in each district might be altered, and, if possible, a clause inserted to the effect that all plans submitted to the local authorities should be prepared by architects. And architects might make a rule that builders getting out their own plans should not be asked to tender for work under any architect. Possibly makers of building materials might be approached in the interests of the profession. Might not a pillory be started, as in "Truth," for publishing petty meannesses and spites against the profession? It is certain that such a policy—starting at the bottom and working piecemeal—contains some prime factors of success, in which union and enthusiasm would not be lacking. A REGULAR READER.

Biggleswade.

The Architectural Profession in Western Canada.



To the Editor of THE BUILDERS' JOURNAL

SIR,—I am writing this letter in the hope that it may save trouble and expense to any of your readers who may contemplate going to the western part of Canada, more particularly British Columbia, either as practising architects or as assistants. I arrived here ten or twelve months ago, as the result of glowing newspaper and other reports, and have since been gradually learning that it is possible to make a mistake in leaving England, even with the present congested state of the architectural profession in that country, and will attempt to briefly state my reasons for saying so. The most boomed town in Western Canada at the present time is Vancouver, the population of which is between 70,000 and 90,000. For the last few years I think that there is no exaggeration in stating that over half the business premises in the town have been occupied by real estate agents, whose sole aim is to boom the district, so that they may sell land. Not only is the town boomed in Great Britain, but also in the United States, Australia, New Zealand, Africa, and Eastern Canada, and at the present time there are practising, architects and assistants from all these different countries, the largest part of whom are without work. Statements appear from time to time in building and other papers showing that building permits issued in the western towns, especially Vancouver, are very numerous in proportion to the size of the towns, but as information for architects' use they are most misleading, for with very few exceptions they represent licences to erect frame houses where the builder who erects the work makes his own drawings, as his client, who in nearly all cases knows nothing of art and good planning, and cares less, is happy to think that he saves the architect's fee. As yet the population is very migratory in character, and the people of the class who, if they finish building a house for themselves to-day, are prepared to sell it to-morrow, if they can make a few dollars out of the transaction. The principal north-westerly town of the United States is Seattle, with a population of about 400,000, and only a few hours' journey distant from Vancouver. Many of the industries and enterprises in Vancouver are supported by capitalists from Seattle, and as a consequence most of the buildings erected, having any pretence to size, are designed by non-resident architects. Then, again, competitions, which might prove a means for an outsider to occasionally obtain work, are usually conducted under such conditions that it is a sheer waste of time to submit drawings unless an architect has, and is willing to resort to, what is called the pull. For example, a competition was held recently, for a city council building, to cost £1,500 (fifteen hundred pounds), and below is a summary of procedure:—(a) Plans to be deposited within ten days of advertisement first appearing; (b), plans sent by Council to fire chief and building surveyor to report upon; (3), fire chief and surveyor recommended plans of Architect A at next meeting of Council; (d), the matter was postponed again until the following meeting of Council, but before this meeting had arrived two other competing architects, B and C, had submitted amended plans, and, to cut a long story short, the amended plans of Architect B were accepted, and he is now advertising for tenders

This is the account as told by the newspapers week after week, for I have not yet heard that the other competing architects have been officially informed of the award, nor have their drawings been returned. In connection with this affair, a certain alderman said that "he had never seen so much leg-pulling in connection with any civic work as was being done by architects." SCOTCHMAN.

Vancouver, B.C.

[We trust that the publicity afforded to our correspondent's letter may have the effect he desires.—ED. B.J.]

WOLVERHAMPTON MODEL HOUSING EXHIBITION.

First Prize Design, Class 1A. Pepler & Allen, Architects.

WOLVERHAMPTON MODEL HOUSING EXHIBITION.

Preliminary List of Awards.

The judges of this exhibition, which is being held at Fallings Park, Wolverhampton, and of which our report is unavoidably held over for want of space, have authorised the following announcement of awards.

CLASS 1A.—The best cottage containing not less than three bedrooms erected at a cost not exceeding £250. Gold medal: (Nos. 89 and 90), architects, Pepler and Allen, Croydon. Builders: Fallings Park Gardens Suburb Tenants, Ltd., Heath Town. Silver medal (Design): (Nos. 303 and 304), architect, A. W. Worrall, Wolverhampton. Commended (construction): (Nos. 303 and 304). Builders: Geo. Cave and Sons, Wolverhampton. Highly commended: (Nos. 322 and 323), architect, F. W. Chapman, Sheffield. Builders: R. Charlesworth, Sheffield. (Nos. 79 and 80), architect, Basil Stallybrass, New Brighton. Builders: Fallings Park Garden Suburb Tenants, Ltd., Heath Town. Commended: (Nos. 305 and 306), architects, Benton and Roberts, Sheffield. Builder: F. W. Beard, Heath Town.

CLASS 1.—Gold medal: (Nos. 11, 12, 13, and 14), architect, W. J. Oliver, Wolverhampton. Builders: Fallings Park Garden Suburb Tenants, Ltd., Heath Town. Silver medal: (Nos. 317 and 318), architect, C. M. Crickmer, London. Builders: Geo. Cave and Sons, Wolverhampton.

CLASS 2A.—Gold medal. (Nos. 78 and 81), architect, Basil Stallybrass, New Brighton. Builders: Fallings Park Garden Suburb Tenants, Ltd. Gold medal: (Nos. 1 and 4), architect, A. Randell Wells, Hastings. Builders: Fallings Park Garden Suburb Tenants, Ltd., Heath Town.

CLASS 3.—No gold medal. Silver medal: (Nos. 309 and 310), architect, F. T. Beck, Wolverhampton. Builders: Geo. Cave and Sons, Wolverhampton. (Nos. 8, 9, 16 and 17), architect, W. J. Oliver, Wolverhampton. Builders: Fallings Park Gardens Suburb Tenants, Ltd. (Nos. 77 and 82), architect, Basil Stallybrass, New Brighton. Builders: Fallings Park Garden Suburb Tenants, Ltd., Heath Town.

CLASS 4.—Best cottage in exhibition. Gold medal and £20 (Nos. 89 and 90), architects, Pepler and Allen, Croydon. Builders: Fallings Park Garden Suburb Tenants, Ltd., Heath Town. Silver medal: (Nos. 303 and 304), architect, A. W. Worrall, Wolverhampton. Builders: George Cave and Sons, Wolverhampton.

CLASS 5.—Special prize for excellency in design of back elevation. Bronze medal: A. Randell Wells, Hastings. Basil Stallybrass, New Brighton.

CLASS 6.—Designs Competition.—Best design of houses to be erected containing not less than three bedrooms, and at a cost not to exceed £200. First prize: Robert Bennett, A.R.I.B.A., and Wilson Bidwell, Letchworth. Second prize: W. J. Oliver, Wolverhampton.

CLASS 7.—Best design of house containing three bedrooms and not to exceed £150. First prize: A. W. Worrall, Wolverhampton. Second prize: Leonard Tracey, Birmingham.

CLASS 8.—Best design of house containing not less than three bedrooms, to be erected at a cost not to exceed £400. First prie: Geoffry Lucas, A.R.I.B.A., London. Second prize: H. L. Paterson, Sheffield. Third prize: Geoffry Lucas, A.R.I.B.A., London.

The following is a list of the judges: — The Mayoress of Wolverhampton; Mrs. A. Baldwin Bantock; Mrs. Medley (nominated by Trade Council); C. E. Bateman, F.R.I.B.A. (nominated by Birmingham Architectural Association); C. H. Barnsley, builder, Birmingham; Detmar Blow, F.R.I.B.A., London; William Edwards, President of Wolverhampton Architectural Association; Henry T. Hare, F.R.I.B.A., London; T. Medley (nominated by Trade Council); Halsey Ricardo, F.R.I.B.A., London.

Obituary.

Mr. Thomas Winn, architect, of Leeds, who died at his residence in Shire Oak Road, Headingley, recently, had enjoyed a large practice in the building and more particularly in the valuation, of licensed premises. The recent extensions of Leeds Union Workhouse were also planned by him. He was a prominent Freemason, and his geniality and generosity had redered him one of the most popular of Leeds worthies.

Professor Friedrich Adler, the well-known German authority on the history of architecture, and an architect of considerable merit, died at his residence in Berlin, last month, in his 81st year. Dr. Adler, who received his training at the Berlin Academy of Architecture under Strack, Drewitz, and Stueler, became professor at this institution in 1863, and received a variety of distinctions and decorations until his retirement five years ago. In addition to a number of churches in Berlin and in the provinces for the plans of which he was responsible, he designed the new Church of the Redeemer at Jerusalem. When the Berlin Technical High School was opened Dr. Adler joined the academical staff, and in 1877 he was appointed consulting adviser to the Prussian Ministry of Public Works. He took a prominent part in the excavations at Olympia, and, in conjunction with Professor Curtius, wrote an account of the results. His numerous technical publications included monographs on the Stoa of King Attalos at Athens, the Pharos of Alexandria, the Mausoleum of Halikarnassus, and the Church of the Holy Sepulchre, while among the best known of his larger treatises were "A History of the Architecture of Berlin" and "The Architecture of some of the World's Historic Cities." Dr. Adler was a member of a large number of learned and archæological societies, both at home and abroad.

Mr. John Wilson Bland, who died at his residence in Trafalgar Square, Scarborough, on September 21st, in his sixty-seventh year, was a member of the firm of Messrs. W. J. Bland and Co., builders, and had been associated with many important contracts.

The body of Mr. William Waterson, builder, of Darlington, was found in the reservoir at Bushel Hill, about a mile and a half from that town, on September 26th. At the subsequent inquest the jury returned a verdict of "suicide while temporarily of unsound mind." Mr. Waterson, who was sixty-five years old, is described as having been one of the most successful speculating builders in Darlington.

The Council of the Junior Institution of Engineers inform us with deep regret of the death of the president of the Institution, M. Gustave Canet, the eminent French artillerist, which took place at La Tourelle, St. Aubin-sur-Mer, on October 8th.

Mr. Francis Adams Sprules, A.R.I.B.A., of Sheffield, who, with his brother, died on Scawfell last Thursday, became an Associate of the R.I.B.A. in 1906. He was just past the twenty-seventh year of his age. He was an experienced mountain climber, and was a member of the Derbyshire Pennine Club.

FIRE-RESISTING CONSTRUCTION SECTION.
(MONTHLY.)

FIRE AT THE PARIS TELEPHONE EXCHANGE.

We are presenting some important photographs of this fire, which we consider to be one of the most interesting from the fire-preventive point of view that have occurred on the Continent of Europe for many years.

Apart entirely from the importance of the fire as such, which entirely disorganised the Paris telephone service, and has involved the French Government in heavy financial loss, this fire stands out as a characteristic one amongst those in a building which has been erected regardless of expense, and in which, nevertheless, the very elements of fire-resistance have been overlooked.

Photo: Topical.

VIEW SHOWING METAL-FRAMED FRONT.

The Paris Telephone Exchange was a modern building of architectural pretensions, covering an important site opposite the General Post Office, and having a frontage of about 220ft, to a depth of about 35ft. It had a basement, a very high ground floor, three storeys of considerable height, and a fourth floor of moderate height. It was lighted at the back from a large courtyard, and it is also well lighted from its two sides. Its planning was simple in the extreme, each floor practically comprising a single room, and there being a spacious staircase at each end. The structure was filled from top to bottom with the most expensive and elaborate telephone equipment, in wood casings, and wood furnishings, and the whole of the wiring is of a very highly wax-taped type. We believe the service has been recently turned into one on the central battery system, and we observe that the voltage used was 440. A rough estimate describes the contents of the building as being worth about £700,000, the building with its contents having cost the Government close on a million sterling. From a fire point of view, the building is well situated, and has the advantage of also being close to a fire station of the Paris Fire Brigade.

Now, it may be scarcely believed, but this structure, which has substantial brick rear and flank walls, and substantial brick walls to contain its staircases, has some 150ft. of its main frontage entirely of metal construction, and this metal construction is in no way protected by any fire resisting material. The floors which rest to the rear on the brick wall, rest to the front on this unprotected metal construction, and there is further on each floor a row of central supports in the form of unprotected cast iron columns. The floors themselves are well made of concrete of good quality, with a kind of porous brick centering slab, but the bottom flanges of the metal joists on which these slabs rest are unprotected, whilst the main girders which carry the metal joists and floors were also either entirely unprotected, or only had a light coating of plastering.

Whatever the cause of the fire may have been originally, it could have easily been stopped, had there not been wide ducts carrying the cables from floor to floor, which ducts had no fire resisting coverings, and which ducts were not even broken in their extent at the floor levels.

The fire broke out in the basement, it spread with great rapidity from floor to floor, and resulted in the absolute gutting of the whole installation, except the fittings on the first floor. The destruction of the second, third, and fourth floors was particularly complete. The temperatures on the second and third floors, although not of great severity, were sufficient to fuse many of the columns, and cause breakage of several. Thus the unprotected girders have sagged in places, and the floors, good in themselves, are now so out of the level, that they will have to be entirely reconstructed.

Photo: Topical.

A SWITCHBOARD BEFORE THE FIRE.

Some of the photographs we present indicate the state of several of the columns.

It is difficult for those conversant with fire-resisting construction to understand how this form of construction should have come about, and yet it is not perhaps as remarkable as one would think, if we remember that much nearer home than France, we have telephone exchanges with excellent floor and roof construction, but with similar entirely unprotected columns, girders, and metal roof trusses.

Paris has certainly had to suffer very severely in its conduct of business and financially, from the constructional blundering in its Telephone Exchange building; we only trust that London will not be put to the same inconvenience through similar blunders. But as the true elements of fire resistance are frequently

PARIS TELEPHONE EXCHANGE FIRE. VIEW SHOWING CORNER.

See also the steel frame building in course of erection in the roadway to form a temporary Exchange.

Photo: Topical.

A PARIS SWITCHBOARD AFTER THE FIRE.

not known to those whose duty it should be to be properly informed on such matters, wonder need not be expressed if a similar *contretemps* were to befall our own metropolis.

The illustrations, we think, all explain themselves, but we would add that a temporary telephone exchange is now being erected, and will be seen on one of the photographs, on the road that lies between the General Post Office and the Exchange building destroyed.

Where there is so much to condemn, perhaps we should however add, that there is one point deserving of all praise, and that the staircase arrangements at the Paris Telephone Exchange were quite excellent, and that the stampede of the operators thus did not result in loss of life.

FERNIE CONFLAGRATION.

The conflagration at Fernie, in south-eastern British Columbia, may be said to have been due to the manner in which some timber limits in the vicinity had been cut over. The timber growth in that district is very rank, and in the forests there are several varieties of trees. It has been the habit of the lumbermen to go through a portion of their limit, cutting out only that kind of tree which they desire to saw into lumber, leaving in the bush the tops, branches, and other debris incident to their cutting operations. At a distance the forest does not seem to have been much cut into, but after a time the ground becomes littered in many places with a mass of dry bush, while numerous small openings have been made in the dense forest.

It was in a limit cut over in this way that, on the afternoon of Saturday, August 1st, a very strong wind suddenly fanned a small fire into a fierce blaze, which fed upon the brush and swept rapidly through the openings made in the forest, burning embers being carried a

PARIS TELEPHONE EXCHANGE. VIEW OF THE THIRD FLOOP, SHOWING BROKEN COLUMN.

long way and igniting buildings some distance ahead of the main fire.

When this wave of flame reached Fernie, which was built upon a plateau 100ft. above the Elk River, the wind apparently divided at the face of the hill and left about fifteen dwellings standing, but swept everything on each side and beyond in the remaining part of the town. The embers and flames were then swept onward by the gale through the forest, destroying all in its path save some timber limits which had not been touched, the dense growth of which apparently turned the wind as if it were a wall.

The catastrophe in Fernie was almost inconceivably sudden. There were few business men who had time to get to their homes to look after the safety of their families. There were delivery waggons which had to be abandoned in the streets. In numerous instances people attempting to save some article of special value had to drop it on the street and run for their lives. There were hundreds of families where the husband was unable to get word of his family, or the family of the husband, for two or three days after the conflagration, some being taken to safety to the east, and others to the west of the town, so that the accounts of the suffering incident o the disaster have not been overdrawn.

The waterworks were untouched, and after the main fire had passed, the water supply was made good use of in saving the buildings left at the first onslaught.

The insurance loss sustained by companies licensed by the Dominion Government will be over $1,300,000, nearly every company doing business bearing some share of the loss. In addition to this sum probably $400,000 more was sustained by English Lloyds and American companies, which wrote some lumber and saw-mill insurance; also the insurance of the Canadian Pacific and the Great Northern Railways, the latter of which lost five bridges and three hundred freight cars loaded with coal and coke.

There were some newly organized companies which suffered losses very much out of proportion to their assets. In one case a company had been organized with very small capital, and had sold stock with the promise that the stockholder would receive a discount of 40 per cent. from the tariff rate for his own insurance. The company's adjuster had not arrived three weeks after the conflagration, and it was said that they had losses amounting to over $25,000. This is a case where cheap insurance will probably prove to have been very dear.

TESTS OF THE BRITISH FIRE PREVENTION COMMITTEE.

There have already been three testing days at the British Fire Prevention Committee's Testing Station since the commencement of the autumn session. The tests undertaken were with extinguishing gear, and one of the appliances so tested should probably have the attention of architects engaged in country house practice. There has generally been a great dearth of water under pressure at country house fires, and the appliances put forward for test are intended to obviate this lack of water under pressure. A cylinder of 125 gallons was under test. It stood at 40lbs. pressure. By an automatic device, the moment a sprinkler comes into operation, or a hydrant is put into force, the pressure in the tank is materially increased to over 100lbs. pressure. The appliance, which is an American invention, was under test for two afternoons, and is at present still under duration tests, so that the report can scarcely be expected until the end of the year.

As is customary at these tests, there was a Sub-Committee of the British Fire Prevention Committee in charge, and Mr. Ellis Marsland acted as directing member, supported by Mr. Fulkes, Chief Officer Dyer, Chief Officer Henderson, and others. The Council were represented by Major-General Festing and Mr. Edwin O. Sachs. There was a considerable attendance of members, and more particularly on this occasion, the Insurance Surveyors.

Another appliance under test should have the attention of architects engaged on the construction or alteration of motor garages. This was an appliance intended mainly for the extinction of petrol fires, and the appliance, if it succeeds in its tests, should be a most valuable acquisition with the increasing motor traffic.

The tests are being continued during this week, and during the following month

Photo: Topical.

PARIS TELEPHONE EXCHANGE. VIEW OF WRECKED SWITCHBOARDS AFTER FIRE.

a report may be expected, i.e., towards the end of November. A most extensive series of tests are being undertaken with this particular appliance. The invention is a Danish one, and it has been put forward by an English concern. In this case there was the usual sub-committee in charge, with Mr. Percy Collins, J.P., as directing member, and there was an exceptionally large attendance of members and visitors, having special regard to the importance of the subject, the Admiralty, War Office, Home Office, and other Public Departments, being strongly represented.

Of other reports shortly expected from the committee will be one with regard to non-inflammable textiles, and one on ordinary buckets of water as fire extinguishers. Of tests expected during the next few weeks are an important series with doors and fire-resisting shutters.

Bournemouth.—On October 13th, the Bishop of Winchester consecrated the new church of St. Andrew's, Boscombe, erected at a cost of £9,000. On the following day, the bishop dedicated the new tower which has been built at St. Stephen's Church at a cost of £6,300. On the third day, the bishop was present at the opening of a new parish hall, costing £2,000, at Holy Trinity Church. Another new church, to be called St. Alban's, in connection with St. Augustin's Church, is also in course of erection, at a cost of £9,000.

THE PARKER BUILDING FIRE, NEW YORK.

So much has been heard of this fire, that a correct statement of what occurred should be of value. This statement, which we present, is the official version issued by the insurance companies concerned, through the medium of their joint office. The building, as is well-known, was of steel frame, with dense terra cotta floor building, and an unsatisfactory form of dense terra-cotta protection for the steel work. Certain floor sections fell bodily during the fire, and fatalities resulted. There were twelve storeys to the building, if we include the ground floor and three basements.

The structure was on a corner site, with two frontages of 121ft. and 150ft. respectively, covering an area of 17,750ft., and the roof ridge was 175ft. above street level. We present some photographs taken almost immediately after the fire.

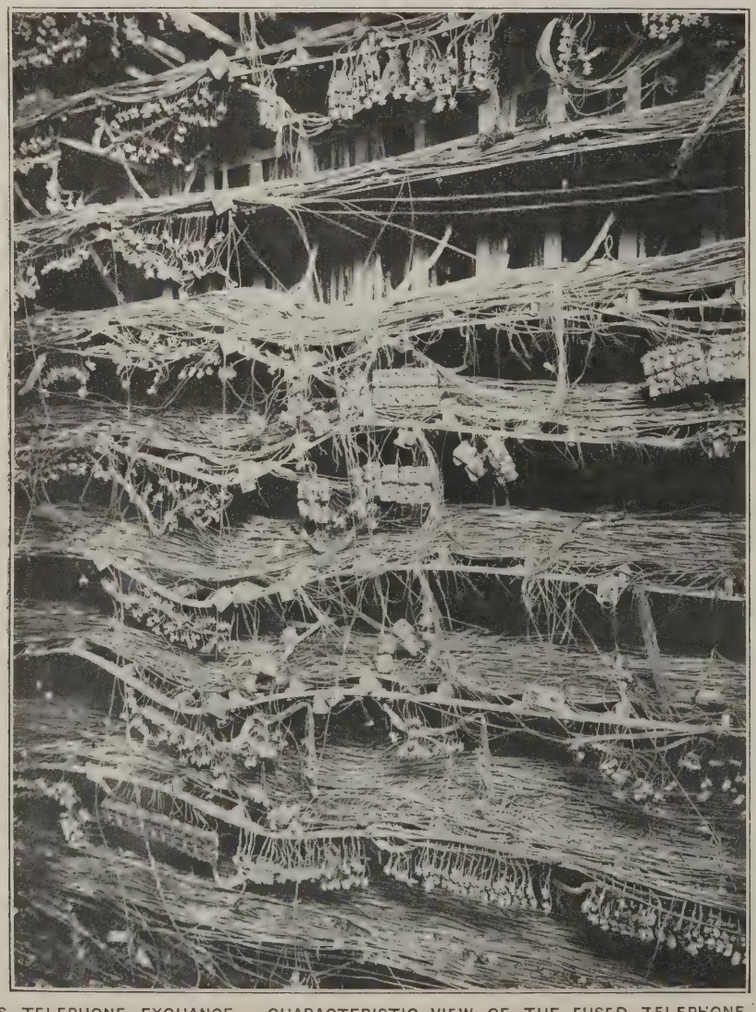
The official statement reads as follows:

Start and Progress of the Fire.

The fire started in the eastern portion of the fifth storey, in the vicinity of the rear stairway. No reliable information regarding its origin was obtainable. It was discovered between five and ten minutes before eight in the evening by Mr. C. J. Spalding, of the Detmer Woollen Company, who, with another employee, was at work in the sixth storey. These people first noticed an unusual number of mice running about the premises, and shortly afterwards heard glass cracking, and saw a bright glow through the glass in the east stairway partition. Mr. Spalding placed the books in the safe, saw his companion out, and afterwards went back into the sixth storey several times, meeting the firemen in the south hall way the last time he left. The fire broke through the glass in the east stairway partition soon after it was discovered, and ignited a stock of empty packing cases and some supplies of stationery located near the stairs. The packing boxes were well afire a few minutes after eight o'clock, and about six to eight minutes after the sixth storey was so full of smoke that it was impossible to enter the rear portion. The night watchman, who passed through the halls, and did not enter the lofts, is reported to have been in the engine-room about 7.25, and to have discovered the fire in the east stairway about the same time it was discovered by Mr. Spalding.

The watchman first turned in the alarm from special building signal box No. 3, 892, located in the south hall way on the first storey, which, in common with similar boxes in other buildings, was directly connected with Fire Department headquarters by private circuit. He afterwards turned in the alarm from street box No. 361, at the corner of Fourth Ave., and Eighteenth Street.

The first alarm was received by the Fire Department from special box No. 3, 892, at 8.01 p.m., followed by street box No. 361 at 8.02. A second alarm was received from street box No. 362 at 8.12, and other other alarms were sent in from the same box at intervals until 9.51 p.m., when the fifth alarm was given. Twenty-five engine companies and five truck companies were engaged at the fire.



The Fire Department responded promptly. The first company coupled up to the Siamese stand-pipe connection on the Fourth Ave. side of the building, and took off the first lead of hose in the south hall-way on the sixth storey. Both fifth and sixth storeys were found to be on fire and filled with smoke, the fire being located in the rear or eastern portions.

The firemen were soon forced to retreat from the sixth to the fifth storey, and afterwards withdrew from the south hall-way on account of lack of water and the dense smoke. No effective inside streams were applied during the early stages of the fire, which was also entirely beyond the control of the outside streams finally brought into service.

The south stairway was inaccessible above the sixth storey, on account of smoke, and the east stairway above the fourth storey on account of fire. The building was not provided with outside fire escapes.

Probably about eight or ten minutes elapsed from the time of the first discovery until the alarm was turned in, and it is reasonable to believe that the fire had gained considerable headway on the fifth storey before it was discovered. It spread rapidly to the upper storeys through the rear stair well, and gained great headway in the eastern portions of the fifth and sixth storeys, the fifth burning slightly more rapidly than the sixth. At about 8.40 the fire burst out on the Fourth Ave. side on the fifth storey, followed almost immediately by fire on the sixth.

Soon after nine o'clock the fire had extended quite generally over the seventh and eighth storeys, the twelfth taking fire a little later, and it was next noted on the ninth, eleventh, and tenth in the order named. All storeys above the fourth burned fiercely, but the fire was appar-

General View of Building after Fire.

View showing column protection dismantled and floor panels collapsed.

FIRE AT THE PARKER BUILDING, NEW YORK, U.S.A.

ently hottest on the sixth, eleventh, and twelfth, particularly in the north and east portions.

Although the wind was not high, the fire extended well out into Nineteenth Street. The records of the Weather Bureau show the wind to have been west and south-west, the velocity being six miles at eight o'clock, and gradually falling to one mile per hour at seven o'clock on the following morning. The temperature was 28 to 29 degrees.

Shortly before ten o'clock all floors of a section of the building approximately 40 by 24ft., next to the rear court, suddenly collapsed, killing three men, seriously injuring fourteen, and slightly injuring many others. The collapse was said to be without warning, no falling of floor arches or portions of the building being previously heard or observed.

The collapse of a section of the twelfth floor, roof and roof house, approximately 60 by 30ft., and located about the centre of the north side, occurred later, knocking out many of the arches in the floors of the lower storeys. Most of the heavier material falling in this collapse was retained by the steel framing of the eleventh floor.

Heavy safes and machinery on several floors broke through the arches at intervals during the later progress of the fire.

The fire was carried into the basement and lower storeys by the first collapse, the damage by fire and to the structure below the fifth storey being due to this collapse. The large, open well holes and openings through the floors formed by the failure of the various sections mentioned, caused the fire to burn with increased intensity. During the more advanced stages, the fire communicated from storey to storey through the exterior windows, being drawn in after the glass was broken by the flames issuing from lower windows. This was most noticeable in the angle of the exterior court in the rear, but occurred to some extent on the Fourth Ave. side. The fire was not under control until seven o'clock on the following morning, about eleven hours after it started, and it continued to burn in the various storeys for several days.

Subsequent examination shows that only the two upper storeys, the large roof house on the north side of the ninth and west end of the seventh storeys were fire swept, practically everything combustible being consumed in these localities. Large quantities of partially burned stock, sections of wood flooring, furniture, etc., next to the rear court windows and to some extent along the west wall, show the effect of the streams applied from the outside. The streams from the building across Fourth Ave. washed the cinder fill-up into piles in several storeys. These streams struck the floor twenty-five to thirty feet back from the windows.

Temperatures Developed.

Careful examination of the metals and materials in the various storeys shows that the maximum temperatures reached in this fire were seldom lower and often higher than those developed in the average fire-proof building in the Baltimore and San Francisco conflagrations.

Glass, brass electric fixtures, and lighter brass parts on typewriters and machinery fused freely at many points in most all storeys above the fifth. (Temperatures estimated at 1,400 to 1,800 degrees Fahr.) Copper wire was not so generally fused, but incipient fusion (slightly in excess of 1,900 degrees Fahr.) was noted in several places in the seventh, eighth, and ninth storeys, and a fairly large stranded copper cable was melted by heat from the fire at several points in the rear of the eleventh storey.

The highest temperature noted in any storey (estimated at slightly in excess of 2,000 degrees Fahr.) was in the N.W. corner of the eighth, where the cast-iron frame of a typewriter was fused. This was the only case where any signs of fusion were observed in cast-iron, although presses and machines were examined wherever accessible. Brass castings having heavier sections were rarely fused, although steam valves had reached the brittle point in a number of places, and brass fixture arms were broken into short sections by their own weight and were melted in several storeys. The temperatures were more uniformly higher in the eleventh than in any other storey in the building. The south stairs and elevators were subjected to comparatively little heat, but the condition of the steel in the east stair and elevator shafts show the effect of temperatures quite as high, if not higher, than in any other part of the building.

FIRE AT THE PARKER BUILDING, NEW YORK, U.S.A. VIEW LOOKING UPWARDS, SHOWING FLOOR PANELS COLLAPSED.

THE DISCOURAGEMENT OF PREVENTABLE FIRES.

By James C. Bayles, Ph.D.

(From Cassier's Magazine).

The annual chart prepared under the direction of the New York Board of Underwriters, showing that through the past year the fires in Manhattan and the Bronx have averaged twenty-three a day, with a loss aggregating about ten millions of dollars, would fail of its purpose if regarded as merely interesting. Such statistics should at least be suggestive of plans of practical reform looking to the better safeguarding of property against injury or destruction from preventable fires. That they are not likely to do so may perhaps be explained by what has become our national habit of thought on this subject. We do not say Kismet, but, if we did, it would perhaps express our attitude. We have accepted the conclusion, quite unwarranted by the facts, that in some mysterious way fire insurance, by distributing fire losses, repays them, and that to keep "well insured" is wiser as a business policy than to take precautions against fires. Hence, the reluctance with which the average policy-holder gives even perfunctory compliance to the few and simple requirements which the companies carrying fire risks have found the courage to prescribe. The elementary economic truths, that insurance creates no wealth to replace that destroyed, and that as a system it penalizes prudence to make good the consequences of imprudence, carelessness and crime, should not be difficult of comprehension; but if comprehended it would perhaps be easier than it now appears to be effectual to discourage preventable fires.

Carried far enough, an analysis of fire statistics would show that only a small percentage of the fires result from causes which properly admit of classification as accidental. The number having their origin in causes which might easily have been foreseen and guarded against by such vigilance as it is proper to demand of those responsible for life and property, is probably 90 per cent. of the total. The remaining ten per cent. would include all that are really accidental, as due to unknown causes or to unusual effects of known causes, besides a good many impossible of thorough investigation. Most fires result from carelessness involving specific violations of laws or ordinances, and on the part of those responsible should be regarded as crimes or misdemeanors, according to the gravity of their consequences. It is impossible to discover and effectually to discourage carelessness in such matters, and to enforce with adequate penalties, impartially applied, the laws and ordinances which are designed to make preventable fires infrequent and unimportant? The discussion of this subject is not wholly academic.

Let us suppose that when a fire occurred it was the immediate duty of a person properly qualified and vested with authority, to learn at once all that could be learned as to the cause or causes of it. This is assumed to be done in cases where incendiarism is suspected, but is done so tardily and clumsily, and with so little intelligence, as to be of very little value. That, however, is another phase of the subject. We are not at the moment discussing incendiary fires, but those which result from preventable causes. If in the investigation of such fires violations of law or criminal negligence are found, it should be the duty of the investigating officer to file an information against the owner, tenant, and any one else involved, or all of them collectively. The next step would obviously be a summons for such persons to appear before the officer, commission or court vested with jurisdiction, and their examination. When the blame was finally focussed, and especially if a violation of the building or fire laws was established, or gross carelessness shown, why should not the person responsible meet the prescribed penalties of such violation, compensate the community for the service he made necessary, and stand, *prima facie*, accountable in damages to those who have suffered injury? Such a procedure would not be unduly drastic, in view of the fact that each resident of a city is in a sense responsible not alone for his own life and property but for those of others. It costs a great deal to maintain a fire department in a high condition of efficiency. Even to respond to a false alarm is said to involve an expense averaging fifty dollars in wear and tear of apparatus, and not infrequently the cost is much greater. If a fire is to be dealt with, the cost may rise to very large figures. Why should not the city recoup itself as far as it can from those who make this waste of public and private property necessary? More than all, why should not the carelessness which invites conflagration be discouraged by measures calculated to implant in the mind of the average citizen a wholesome respect for the law, if not for the rights of others?

One does not need to visit a city lying somewhere between Altruria and Utopia to find the same principle exemplified in a very practical and successful way. An American gentleman living with his family in Berlin was one morning awakened by the smell of smoke in his apartment, and found that a fire originating in a room overhead was eating its way down through the ceiling of his dining-room. He dressed, went to the street, and turned on an alarm, which in due course was responded to by the fire department. Such response is never what might be called precipitate in Germany, but is as prompt as circumstances seem to require. What is known in America as "red tape" seems to a foreigner very much in evidence in every German official proceeding, but I was never able to observe that it interfered with getting official work done in the best and most thorough way. The fire I am describing was extinguished with chemical apparatus without any water damage, and without needless destruction of walls or furniture; and before the firemen left they had removed every trace of debris and scrubbed the floors of the rooms in which they had worked.

Meanwhile, a careful investigation was made by officers equipped with note books, not by asking questions of tenants or gossipping with servants, but from personal observation. Next morning the gentleman who had turned on the alarm was sent for, and conducted before a fire marshal, or equivalent officer, with inquisitorial powers. That he had important engagements elsewhere counted for nothing. Public business never waits on private convenience in Prussia. He was asked all sorts of questions, which he was able to answer satisfactorily. The fire was known to have originated in a coal which has dropped from a laundry stove in the attic, and rolled upon an unprotected wooden floor. The tenant showed that the stove was an appointment of the building, provided by the landlord, and that it was neither his duty nor his privilege to change it. Then the landlord was called. He showed that he had but recently purchased the building, under the usual guaranty that all laws and ordinances had been complied with in construction and appointments; that he had neither set nor moved the stove in question, and that his attention had not be called to any conditions involving a fire risk. This was not considered quite satisfactory, and he was told to await further instructions. Then the builder from whom the landlord purchased, was called. He had to admit that he, as builder, was responsible for the setting of the stove as the police had found it, and that he had violated the law in neglecting to provide a suitable metallic hearth, of the required kind and dimensions, between it and the floor. For this he was held culpable. The assessment against him began with the estimated cost to the city of responding to the alarm and extinguishing the fire, included the damage to the furniture and property of tenants, and was rounded by an exemplary fine of 500 marks, as a reminder that the laws are enacted for a purpose, and carry substantial penalties for their violation. The damage to the building was not included in the assessment against the builder. It was held that while the owner had not committed the violation of law which caused the fire, he had been negligent in not discovering it and correcting it, and for this reason he should pay for his own repairs, and stand charged with knowledge of his duty in like cases. That he escaped a fine was deemed a cause for congratulation among his friends. Had he owned the building longer, he would undoubtedly have had to pay a fine for neglect of duty in permitting a violation of law to exist on his premises.

Well, why not? Perhaps we cannot expect in American cities to do things as they are done in the capital of which the late Abram S. Hewitt once said: "If we could forget all we know about municipal government it would be no misfortune, since we might learn it much better in Berlin." But if we could even approximate the Berlin standard of intelligence and thoroughness in dealing with those responsible for preventable fires, he would cut down the annual fire loss to a very small percentage of what it is. In Berlin it pays those responsible in such matters to be careful to do nothing and neglect nothing for which, in the event of fire, they will be held responsible. Consequently, fires there are relatively infrequent and rarely serious. During some three years' residence there, I recall but one which attracted attention—an old market building, the destruction of which was regarded generally with satisfaction. In the United States we insure—and leave the rest to the fire department. The natural result is that fires are both numerous and costly. There are plenty of very good laws and ordinances, but they are of little practical value, since no one pays attention to them. They would enforce themselves if the penalties they describe were made great enough, and were impartially exacted of those who incur them. Whether public opinion is ready for a movement in the direction of a reform so important and so obvious is another question.

BIRMINGHAM BUILDING TRADES EXHIBITION.

At the opening of the Birmingham Building Trades Exhibition on October 12th, the Lord Mayor of Birmingham, who performed the ceremony, congratulated the management on having brought together such a large and representative kind of exhibition. British manufacturers, he said, were proverbially modest compared with foreigners, who boomed goods that were frequently of inferior quality. The British manufacturer relied too much on the quality of his goods for advertisement, and in this he made a great mistake. He understood that 5 per cent. of the receipts of the exhibition were to be given to charity, and he suggested that the money should be given to the City Aid Society, to help those who were at present out of work. In proposing a vote of thanks to the Lord Mayor, Lieutenant-Colonel J. Barnsley remarked that the building trade was in a more depressed state that it had known for forty years, and the unemployed of that trade would certainly have reason to feel grateful for the Lord Mayor's dedication of the percentage of receipts. The exhibition remains open until October 21st. Many exhibits were described in last week's issue. Further notices are now given. Readers are again reminded that our stall (No. 79), where copies of our publications may be purchased, is freely available to visitors. for the receipt of parcels, for the keeping of appointments, writing of letters, etc.

The following Exhibits at the Exhibition were not noted in our issue last week:—

THE ASSOCIATED PORTLAND CEMENT MANUFACTURERS (1900), LIMITED.

This firm, whose offices are at Portland House, Lloyds Avenue, London, E.C., have, at the Building Trades Exhibition, Bingley Hall, Birmingham, a large and handsome stall (of which we are able this week to show an illustration), at which the products of the firm are shown at all stages of preparation and manufacture. Samples of their raw materials employed in the manufacture of Portland cement are shown, as well as samples of slurry, and of clinker at various stages, and of the finished cement. Samples of the company's special "Ferrocrete-" brand, for reinforced concrete construction, are attracting special attention; and there is an interesting display of a quantity of briquettes of various ages for testing tensile strain and complete testing apparatus in conformity with the requirements of the British standard specification. The practical tests that are being carried out at the stand are watched with close attention. Mouldings, etc., in plaster of Paris, Keene's Parian, and Roman cements lend an artistic interest to a thoroughly attractive and quite educational series of exhibits. Pamphlets descriptive of the A.P.C.M. Co.'s works and process of manufacture can be had on application at the stand. It may be here opportunely recalled, in the year 1900, this company acquired the works and businesses belonging to twenty-two firms or companies, including the oldest-established and best known in the world. Amongst these were:—John Bazley White and Bros., Ltd.; Hilton, Anderson, Brooks and Co., Ltd.; Knight, Bevan and Sturge; Burham Brick Lime and Cement Co., Ltd.; Francis and Co., Ltd.; London Portland Cement Co., Ltd.; Gibbs and Co., Ltd.; Robins and Co., Ltd.; The Arlesey Lime and Portland Cement Co., Ltd. The various properties owned by the Company in the valleys of the Thames and Medway alone cover 4,000 acres. The river frontages with their extensive docks and wharves are more than nine miles in length, and a fleet of 200 vessels (steam tugs, lighters, and barges), owned by the Company, is daily employed for the transport of materials and products to and from the various works. Several of the works have equal facilities for delivery by rail and water. The cask-making machinery at the company's cooperages is capable of turning out upwards of three million barrels a year, chiefly for export, the greater part of the cement for the home trade being supplied in sacks. At the numerous factories, every approved method of mixing the raw materials and burning and grinding the cement may be seen in operation, and careful experiments are being continually made to test any new process which may lead to improvement in quality or economy of production. The largest works on the Thames are situated at Northfleet, Swanscombe, and Grays, and on the Medway at Rochester, Halling, and Burham. The company employs fully 6,000 people, and the annual capacity of its works will shortly be brought up to approximately one and a half million tons. At Gravesend the central offices and laboratory are in telephonic communication with each of the works, and their respective laboratories and testing rooms, from which daily reports of chemical and other tests are received and registered. There is constant communication between every department and the London offices at Portland House, Lloyd's Avenue, E.C., where the whole of the sales, finance and general organisation are controlled.

THE ASSOCIATED PORTLAND CEMENT MANUFACTURERS' STALL AT THE BIRMINGHAM EXHIBITION.

MAENOFFEREN SLATE QUARRY COMPANY, LTD.

This Portmadoc firm, the main part of whose workings are in the "Old Vein," at Blaenau-Festiniog, have roofed their stand with slates from this quarry. They show also other samples of their products, as well as an interesting series of photographs illustrating quarry scenes.

OAKELEY SLATE QUARRIES COMPANY, LIMITED.

This firm, whose London offices are at 53, Parliament Street, S.W., and whose quarries are at Blaenau-Festiniog, show samples of their "Old Vein," blue roofing slates, which, it is stated, are in high favour for engine sheds and gas works, on account of their ability to withstand the fumes from locomotives and gas retorts.

MESSRS A. BOULTON AND CO.'s BRICKS AND TERRA COTTA.

This firm, whose office is at Central Chambers, Shrewsbury, show a selection of their stock of terra-cotta goods and beaded and moulded bricks, as well as some red and white chimney-pots

LOCKERBIE AND WILKINSON, LTD.

This firm, whose address is Exeter Street, Birmingham, show, in addition to various kinds of door furniture, fanlight gearings, and miscellaneous metalwork goods, some fine examples of architectural ironwork, such as gates, railings, and grilles.

STOTHERT AND PITT'S "SMITH" CONCRETE MIXER.

Stothert and Pitt, Ltd., Bath, exhibit their "Smith" concrete mixer, which, we understand, is widely and favourably known in America, and is no doubt destined to become equally popular in this country. It deals swifty and efficiently with any material, and its 3,000 users will no doubt be greatly augmented as a result of inspection at the present exhibition, where, in view of the enormously increasing use of concrete, the machine is allocating a great deal of attention.

The SILICATE PAINT COMPANY (Messrs. J. B. Orr and Co., Ltd.), of Charlton, London, S.E., show examples of what can be done with their well-known "Duresco" washable water paint.

The recent improvements and additions to the "Guardian" offices, Warrington, were under the supervision of Messrs. W. and S. Owen, architects, Warrington, and the constructional steelwork and fireproof floors were carried out by Messrs. Homan and Rodgers, Manchester.

Federation News.

THE INSTITUTE OF BUILDERS.

Annual Dinner.

The annual dinner of the Institute of Builders took place at the Whitehall Rooms, Hotel Metropole, on Wednesday last, Mr. James Carmichael, the President, occupying the chair. Among those present were Messrs. C. H. Barnsley, President, National Federation of Building Trade Employers; Wm. Laurance, President, London Master Builders' Association; and M. H. Pocock, Master of the Carpenters' Company; Messrs. Joseph Bell, Frank May, J. Howard Colls, H. H. Bartlett, B. J. Greenwood, J. Randall, T. J. Dove, William Shepherd, F. L. Dove, and Charles Wall, past Presidents of the Institute; Messrs. W. F. Wallis, J. S. Holliday, Fredk. Higgs, and H. Arthur Bartlett, Vice-Presidents of the Institute; and Messrs. Howell J. Williams, F. G. Minter, R. J. Holliday, C. H. Mabey, W. Higgs, and W. M. Higgs, and Mr. Thomas Costigan, Secretary of the Institute. The architects and surveyors present included Sir Aston Webb, R.A.; E. Guy Dawber, F.R.I.B.A.; Sidney Young, F.S.I.; J. S. Gibson, F.R.I.B.A.; William Woodward, F.R.I.B.A.; Professor Beresford Pite, F.R.I.B.A.; Ralph Knott; Edwin T. Hall, F.R.I.B.A.; Henry T. Hare, F.R.I.B.A.; H. Steward, F.S.I.; G. Corderoy, F.S.I.; E. Gabriel, F.R.I.B.A.; W. D. Pite, F.R.I.B.A.; R. L. Custis, F.S.I.; H. J. Leaning, F.S.I.; Ernest Runtz, and Fernand Billerey.

After the loyal toasts had been honoured, Mr. William Laurance, President of the London Master Builders' Association, proposed the toast of "The Architects and Surveyors," with which he associated the names of Sir Aston Webb, R.A., and Mr. Sydney Young. He noted the number of distinguished architects and surveyors present, and wondered if it was a foretaste of that future state when the lion and the lamb should lie down together. They felt great respect for the architects, and thought, as Englishmen, they should be proud of their architecture. They had great reason to be proud of the graceful beauty of our South Kensington Museum; though he wondered if such a building could ever be reproduced in reinforced concrete. The surveyors were a great guidance and help to the builders, and he was glad to mention that that day was the jubilee of Mr. Sydney Young, with whose name his toast was associated, Mr. Young having commenced his articles on October 14th, 1858.

Sir Aston Webb, R.A., replying for the architects, said he hoped and believed his was a modest profession, and that they would not compare present work with that which had stood and excited admiration for centuries. Of all men he knew, builders were the ones who paid most attention to their business and to carrying out the work. While he was in America he heard of a builder in Boston who carried that principle too far—so far that his wife objected to this exclusion of all other interests; and persuaded him that he might have a hobby, or take up a course of reading. It being Sunday she suggested the Bible as a suitable volume, and one that could be commenced wherever opened. The builder acted on this advice, and soon became very absorbed. Presently he began figuring on sheets, covering quantities of foolscap with diagrams and calculations. A call to lunch was disdained, and in the middle of the afternoon, his wife, extremely puzzled at his behaviour, came to ask him to find out what he was doing, and if he had really not finished. "Yes," he said; "guess if I had to build that Temple I'd do it in half the time and for half the money!" If he might speak seriously for half-a-minute, he wished to say how architects appreciated and sympathised with builders over the great difficulties with which they had to deal at the present time. They needed the qualifications of great generals—organisation, foresight, and courage. He regretted that the workmen should be organised against them, and taught to regard them as enemies instead of friends. He thought the workmen were to blame for much of the unemployment, and there would be more unemployment if builders did not frequently take work at little or no profit, in order to keep their staffs going. The extraordinarily low price at which work was being done would, he thought lead them to consider the necessity of adopting American methods. He instanced the Scotch crane which we used here in addition to outside scaffolding; but the Americans, like the Scotch, dispensed with the outside scaffolding. He was not there, of course, to teach them their business; but he felt that they were all members of one fraternity, hoping to produce good buildings, which he trusted might be beautiful.

Mr. Sydney Young, responding for the surveyors, called to mind many of the surveyors he had known during the time of his articles, most of whom had now passed away, and said that quantity surveyors in those days gave better work and got better pay. They had not then the elaborate drawings to take off—drawings frequently lacking very necessary details—and they never then received less than 1½ per cent. He thought Sir Aston Webb's Boston builder a remarkable man, for his remembrance of the details of the Temple were that they were far too scanty to take out quantities from.

Mr. J. S. Gibson, proposing the toast of "The Institute of Builders," coupled with the name of the President, said he supposed they might all regard themselves as comrades in the great army of the unemployed, and he thought, to use an Americanism, that "they would have to get on a bit of a hustle before they got through with it." The Institute of Builders had a great work in controlling the work of architects. Builders relieved the latter of much of the difficulties of building which they had neither the time or the inclination to deal with. The Royal Institute was concerned not merely with the interests of architects, but with the encouragement of good building. There were many phases of good building, and they valued the hearty co-operation of the Institute of Builders in the practical aspects, in dealing with sanitary laws, and so on. With respect to their President, he thought that by the building up of a great business in London he was doing a work of great value to the country. The Institute of Builders, during his term of office, would be carried on with the tact and shrewdness necessary to such a great institution.

The President, Mr. Carmichael, returned his thanks for the cordial manner in which the toast had been received, and said he would waive aside the references to himself which Mr. Gibson had been kind enough to make; but he wished to endorse all that he had said in support and commendation of the Institute of Builders. It had now been established 35 years, carried on its work in a quiet and unostentatious manner, and was steadily growing in power, numbers, and influence. It was the only incorporated association of builders in the country. When he mentioned that its work was done in a quiet and unostentatious manner, he meant that they had no part in the strife or disputes with workmen in the country; all those matters were carried on by the Federated Associations and by the National Federation of Building Trades Employers, whose President, Mr. Barnsley, was with them that evening. The work of the Institute of Builders, he explained, was to keep a watchful eye upon legislation and a sympathetic eye upon education. He thought he heard someone say it was a big job. Well, perhaps at the present time they ought to keep both eyes on much of the vexatious legislation that was being promoted. He thought they ought to follow the example of the builders of the Temple—to which reference had that night been made—and keep swords girded at their side, ever watchful of the movements of the foe. With regard to education, two of their members, Mr. Rice and Mr. F. Higgs, had been appointed examiners to the City and Guilds of London Institute. So successful have their efforts been that the Council has granted sums of money for medals and prizes for the students. He was glad to see and to have the support of so many of the fathers of the Institute of Builders, who added a dignity and grace to their meeting. He thanked the Council for their efforts and support, and Mr. Costigan for his unwearied efforts and help, often given while suffering from bodily weakness. To every member of the Institute he tendered his hearty thanks.

Mr. Edwin T. Hall said the difference in the functions of the Institute of Builders and the National Federation, though well known to their hosts, were not known to many until the President had defined them that evening. Reference had been made to the lion and the lamb, which he at the time did not understand; but it had since been pointed out to him that the letters l—a—m—b were those of the London Association of Master Builders, so that he supposed he had the pleasure of proposing the toast of the lion—the National Federation of Building Trades Employers coupled with the name of its president, Mr. C. H. Barnsley. The National Federation was composed of the various associations of building employers all over the country, and they were associated for mutual support, help, and consultation. Their friends in the north probably saw more of the antagonism between capital and labour than they of the south. He wondered why there should be this antagonism. What was the good of capital if it was not expended? If it was stored up it could not fructify; and where then was the money coming from to pay the wages of those employed? Capital and labour were so mutually interdependent that they should work together in harmony. They were all members of a great world confederation of building, and when they came to realise the history of building they would recognise to what a noble craft they belonged.

Mr. C. H. Barnsley, responding, said the work of the Federation increased every year—not so much in regard to their relations with the workmen, as with legislation—which was often vexatious, and prevented them from carrying out their contracts. Mr. Young had made a humorous reference about getting out quantities, but he found that there were surveyors and surveyors, and it would puzzle the fertile brain of the most experienced contractor to get out costs from many of the quantities frequently supplied to builders. That showed the necessity for them trying to get all surveyors interested in the Quantity Surveyors' Institution, so that they would get quantities they could understand. It was not only difficult to analyse quantities; but they must have a basis of experience and knowledge as to pricing them. In many cases, when they came to the end of a contract, the basis on which they had been working was found to be wrong. The desire of the Federation was to make their workmen understand that their interests were inseparably bound up with those of the employers. The Institute of Builders and the Federation were working hand in hand, and the relations with their workmen were never better than they were to-day. That good feeling they hoped to increase and strengthen.

Mr. H. Arthur Bartlett briefly proposed the visitors, and Mr. William Woodward, responding, remarked that they were said to be of the great army of unemployed; but when he looked round that assembly, so happy, so well nurtured, and so well-dressed, he saw no evidences of it. He concluded some humorous remarks by saying that it was to the workmen that they must look for improvement in trade. With less labour interference there would be more work, and the client would unbutton his pocket and start building, which would lead to the general revival of trade which they all desired.

Contractors' Notes.

The "Times" is responsible for the statement that Mr. George Dew, L.C.C., having failed to retain the support of the Carpenters' and Joiners' Society, has relinquished his Parliamentary candidature for the Attercliffe Division of Sheffield.

The Guildford Town Council have received a letter from Mr. A. W. Hall, secretary of the Guildford and District Master Builders' Association, asking their kind consideration in providing bills of quantities for building works to be carried out and tendered for in open competition from time to time. It was felt that such an appeal was desirable on the fact that builders should not be expected to bear the expense and be put to the inconvenience of taking off their own quantities in competitive tendering. Further, they suggested that bills of quantities and forms of tender should be provided for all future works of a more or less extensive character; and that names and addresses of sureties usually inserted in the form of tender should not be demanded except in the case of the successful competitor, and even then not until after the acceptance of his (or their) tender. The matter was referred to the General Purposes Committee without discussion.

Matters of Opinion.

No. 1.—The Increasing Employment of Specialist Contractors.

(Continued.)

The following further opinions have been received in addition to those published last week:—

MESSRS. BREWILL AND BAILY, F F.R.I.B.A., Nottingham.

In connection with the complaints of contractors regarding the selection by architects of specialists to execute various works for which provisional sums are included in the quantities, we would point out that in the provinces there are very few builders with fully-equipped shops, or who employ workmen in all trades, it is, therefore, absolutely necessary to sublet a very large amount of the work and it would never do to rely upon the builder's selection. It is customary in the Midlands for a master bricklayer or master joiner to undertake a general contract, and he sublets the other trades (in case of a master bricklayer) joinery, plastering, plumbing, etc., and in order to prevent inferior tradesmen being employed it is necessary for the architect to approve the name of such tradesmen. It is also obvious that where specialists employ a staff of workmen carrying out only the work described, that they are better able to execute such work than the builder, who probably only does small quantities and whose workmen are therefore not accustomed to the same.

MR. H. C. CORLETTE, F.R.I.B.A., London.

The point you refer to as having been raised by general contractors is important. But the cases must be few indeed where 40 per cent. of the work under a contract is covered by p.c. provisions. The instance referred to was, no doubt, one where special furniture fittings and decorations not ordinarily done by a general contractor, and of considerable value in proportion to the total amount of the general contract were required. And, presumably, the general contractor was allowed a percentage as profit on all the work done by specialists for which he was held responsible, a compensation being thus provided to meet his accepted liability in respect of it. Possibly this compensation in certain cases would be inadequate, and a claim for a higher percentage might be preferred. Architects could consider such cases on their merits, and arrange a fair provision. The profit allowed to a contractor would no doubt be kept as low as possible in the client's interests. But contractors would ordinarily claim what they considered an adequate profit on p.c. provisions. It may become desirable also to define what work can with reason be reserved for specialists. Many contractors are able to undertake certain work themselves as specialists. But where particular crafts are concerned, and where the individuality and personal capacity of the workers in these are an essential element in that co-operation which an architect must secure for the benefit of the work as a whole, the principle of p.c. provisions could not be dispensed with. It is conceivable that financial interests may clash unless fairly provided for and controlled by adequate stipulations. The responsibility of each principal for his own special work and for workmen directly employed by him is necessary. Those specialists whose work can be provided for through the general contractor, as sub-contractors, could be held responsible to him, he himself being responsible to the architect. But those specialists who are called in direct, and not as sub-contractors in this sense, would be separately responsible. The sole reason why architects employ specialists is for the purpose of getting the best work and material required in every branch. If general contractors specialise to a greater degree than at present in certain directions, it will not be necessary for architects to seek elsewhere than among their own skilled men for the craftsmanship they require. But from the nature of the case architects would still have to accept the responsibility of deciding how and by whom the work may be done in each particular case. And it is only reasonable to suppose that contractors would themselves agree that specialists have always been, and will continue to be, necessary in works of importance. The difficulty is to discover how to take advantage of their skill without detriment to their interest, or those of the general contractor, and without the risk of damaging the efficiency of a building or losing the chance of realising an architectural ideal. And, speaking in a general sense, it seems too much to expect that a contractor should be made responsible for work which he does not control, unless he is prepared to accept the responsiblity in consideration of some compensation in the form of profit allowed on the cost of the work dealt with under the p.c. provisions. Legal liabilities under the Workmen's Compensation Act are, no doubt, provided for by insurance. If these are equitably distributed in agreements as between principal and contractor, sub-contractors would indemnify their principal in each case, and be responsible for their own staff alone.

Coming Events.

Monday, October 12, to Wednesday, October 21.
MIDLAND COUNTIES BUILDING TRADES EXHIBITION, Bingley Hall, Birmingham.

Thursday, October 22.
ROYAL SANITARY INSITUTE.—Mr. H. D. Searles Wood, F.R.I.B.A., on "Sanitary Building Construction and Planning: Soil and Local Physical Conditions," 7 p.m.

Friday, Oct. 23.
ARCHITECTURAL ASSOCIATION.—Prof. Beresford Pite, F.R.I.B.A., on "Michael Angelo as an Architect," 7.30 p.m.

Monday, October 26.
ROYAL SANITARY INSITUTE.—Mr. W. C. Tyndale, M.Inst.C.E., on "Sanitary Appliances," 7 p.m.

Tuesday, October 27.
ROYAL SANITARY INSTITUTE.—Mr. J. Osborne Smith, F.R.I.B.A., on "Ventilation, Warming, and Lighting," 7 p.m.

ARCHITECTURAL ASSOCIATION OF IRELAND. — Mr. W. A. Scott, A.R.I.B.A., on "Celtic Romanesque Work in Ireland."

Wednesday, October 28.
ROYAL SANITARY INSTITUTE.—Mr. J. Wright Clarke on "Details of Plumbers' Work," 7 p.m.

Wednesday, November 4.
INSTITUTE OF SANITARY ENGINEERS.—Sessional Meeting. Mr. J. Lawrance on "Modern House Drainage," 8 p.m.

Thursday, November 5.
BUILDERS' BENEVOLENT INSTITUTION.—Annual Dinner, Whitehall Rooms, 7 p.m.

Monday, November 9, and Tuesday, November 10.
ROYAL INSTITUTE OF BRITISH ARCHITECTS. — Preliminary Examination.

Monday, November 9, to Thursday, November 13.
ROYAL INSTITUTE OF BRITISH ARCHITECTS. — Intermediate Examination.

Thursday, November 12.
MANCHESTER SOCIETY OF ARCHITECTS. — Mr. C. Clement Hodges, on "Norman Architecture in the Northern Counties of England," 6.30 p.m.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.—General Meeting. Mr. W. H. Allen, on "The Manufacture of Glazed Bricks, Terra-cotta, and Pottery," with limelight illustrations.

Date of Publication:—The BUILDERS' JOURNAL AND ARCHITECTURAL ENGINEER is published every Wednesday, price 2d.

A Special Section is regularly presented free with the ordinary issue, three weeks out of every four. These three regular monthly supplements are entitled "Contractors' Section," "Concrete and Steel Section," and "Fire-resisting Construction Section" respectively.

The Subscription Rates per annum are as follows:—

	s.	d.
At all newsagents and bookstalls	8	8
By post in the United Kingdom	10	10
By post to Canada	13	0
By post elsewhere abroad	17	4

The Index (with Title Page) for each half-yearly volume is supplied free on application to the Publisher.

Subscribers can have their volumes bound complete with Index, in cloth cases, at a cost of 3/6 each.

Advertisements for the current week, alterations to serial advertisements, etc., must reach the office not later than first post on Saturday.

Rates for Serial Advertisements, Special position etc., sent upon application.

Situations Wanted, Situations Vacant.

4 lines (about 28 words), one insertion - 1s. 6d.
Each additional line - - - - - 6d.
Three insertions* - - - - - 3s. 0d.

This includes 6 weeks under Employment Register.

Miscellaneous, Drawings and Tracings, Educational, Competitions Open, Partnerships etc. per 6d. line.

The above must be prepaid.

Property and Land Sales, Legal Notices, etc., 9d. per line

Advertisements for the above can be received up till 10 o'clock on Tuesday at

CAXTON HOUSE, WESTMINSTER.

Tenders.

Addressed postcards, on which lists of tenders may be stated, will be sent free on application to the Manager, BUILDERS' JOURNAL, Caxton House, Westminster.

Information from accredited sources should be sent to "The Editor," at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Colchester.—Accepted for erection of superstructure of new asylum at Colchester, for the Essex County Lunatic Asylum Committee:—

Waring and White, Cockspur Street, S.W.	£191,545

Ebbw Vale (Mon.).—For erecting a surgery and certain alterations at Beaufort, for Ebbw Vale Doctors' Fund Committee. Mr. H. Waters, architect, Market-chambers, Ebbw Vale:—

S. Beavan	£837 0 0
J. Watkins	569 12 0
D. Morgan,* Beaufort	503 2 6
W. Davies and Co.	498 18 0

Guildford.—For the erection of certain buildings over the gas producer plant and machinery at the waterworks, Millmead, for the Town Council. Mr. G. C. Mason, A.M.I.C.E., borough engineer and surveyor:—

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Oct. 22. DARLINGTON.—Erection of a governor house and time office at the gasworks for the Corporation. Plans, etc., may be seen, and form of tender, etc., obtained on application at the offices of George Winter, borough surveyor, town hall.

Oct. 22. PRIDEAUX. — Alterations to Nanscawen Farm, Prideaux, for Sir Colman B. W. Rashleigh. Plans and specifications may be seen at the office of the architect. Sealed endorsed tenders will be received by noon on Oct. 22, by B. C. Andrew, M.S.A., architect, Biddick's Court, St. Austell.

Oct. 22. BEDLINOG.—Erection of 15 or more cottages at Bedlinog, for the South Wales Estates Company (Limited). Plans and specification may be seen and all particulars obtained at the office of William Dowdeswell, architect, Treharris. Tenders, endorsed "Cottages," to be sent to Edwards Bros., Cambria Chambers, Dowlais by Oct. 22.

Oct. 22. MORLEY. — Various works except mason's required, in addition and alteration to Glen Mills, Morley, for Albert Glover. Quantities to be obtained at the office of T. A. Buttery, Exchange Buildings, Queen Street, Morley, on Oct. 15. Tender to be sent to the proprietor, Glen Mills, Morley, on Oct. 22.

Oct. 23. SHREWSBURY.—Erection of elementary schools at Colcham, Shrewsbury, for the education committee of the corporation. Persons desirous of tendering are requested to send their names to the architects, A. B. and W. Scott Deakin, 12a, Pride Hill, Shrewsbury, by Oct. 23. Quantities will be supplied on deposit of one guinea.

Oct. 23. GLANTON, near Alnwick.—Demolishing existing offices, and erecting new latrines, etc., at Glanton schools for the managers. Plan, specifications, bills of quantities, and forms of tender are deposited with the schoolmaster at the school house, Glanton Tenders, endorsed, to be sent to H. W. Walton, clerk to the managers, Fenkle Street, Alnwick, by October 23rd.

Oct. 23. LONDON.—Extension of the Royal Courts of Justice (first contract), for the Commissioners of H.M. Works and Public Buildings. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to Sir Henry Tanner, I.S.O., F.R.I.B.A., at Storey's Gate. Bills of quantities and forms of tender may also be obtained there on payment of one guinea. Tenders must be delivered before noon on Oct. 23, addressed to the secretary, H.M. office of works, etc., Storey's Gate, London, S.W., and endorsed "Tender for Royal Courts of Justice Extension, First Contract."

Oct. 23. CORK.—Erection of new additions, etc., to the resident engineer's house at the pumping station, Lee Road, Cork, for the Corporation, in strict accordance with the specification, drawings, and conditions of contract prepared by the city engineer. Drawings, general conditions, and specification may be seen and tender form and all information obtained at the city engineer's office, city hall, Cork, from 10 to 4 daily. Intending contractors must first lodge £1 with the city treasurer. Persons tendering must lodge with tender a sum of £10. All materials used to be as far as possible of Irish manufacture. Sealed tenders, endorsed "Tenders for New Additions and Improvements to R.E.'s House, Waterworks," must be deposited before noon on Oct. 23, with F. W. M'Carthy, town clerk, Cork. Fair wages clause.

Oct. 24. ABERYSTWYTH.—Alterations and additions to a house in High Street for Evan Davies. Plans and specifications may be seen at the office of the architect. Sealed tenders are to be delivered by Oct. 24, to J. Lewis Evans, architect and surveyor, 21, Great Darkgate Street, Aberystwyth.

Oct. 24. BRAUNTON (DEVON).—Erection of a pair of semi-detached villas at Vellator, Braunton, for E. J. Slee. Plans, specification and conditions can be seen at the office of H. W. Weir, M.S.A., 32, Greenclose Road, Ilfracombe, between 10 and 4, where sealed endorsed tenders are to be delivered by noon on Oct. 24.

Oct. 24. CAVERSHAM (Oxon).—Erection of a footbridge at Lower Caversham, for the Caversham U.D.C. Plans and specifications can be seen at the office of Alfred J. Smith, surveyor to the Council, Gosbrook Street, Caversham. Sealed tenders, endorsed "Footbridge," are to be delivered at the surveyor's office by mid-day on October 24.

Oct. 24—Nov. 18. ROWLEY REGIS.—Erection of public libraries, Nos. 2 and 3, being one at Ross Road, Black Heath and Rowley Regis, and the other at Dudley Road, Tividale, for the U.D.C. £1 for quantities in each case must be sent to the clerk before Oct. 24, with name, etc., of applicant. Plans, specifications, and conditions prepared by Wills and Anderson, the council's architects, may be seen at the council's offices, Old Hill, on and from Nov. 7, between 10 a.m. and 4 p.m. (Saturdays, 10 a.m. to 1 p.m.). Tenders, duly endorsed, must be delivered by 9 a.m. on Nov. 18, to Daniel Wright, clerk, council offices, Old Hill, Staffordshire.

Oct. 24. NORWICH.—Erection of a secondary school, with alterations to existing buildings, at Eaton Road. Personal application must be made at the offices of C. J. Brown, architect and surveyor, Cathedral offices, The Close, to inspect the drawings, specification, etc., after which form of tender, etc., can be obtained at the city accountant's office, Municipal Buildings, upon depositing Bank of England notes of the value of £25.

Oct. 26. WILMSLOW (Cheshire).—Erection of new council schools, to accommodate 700 scholars, at Wilmslow, Cheshire, for the Knutsford and Wilmslow administrative sub-district committee. Plans, specifications, etc., prepared by Herbert H. Brown, architect, may be inspected at his offices, 17, Dickinson Street, Manchester. Persons desirous of tendering must send their names to the architect, accompanied by a deposit of two guineas, before Oct. 9. Tenders, enclosed in sealed envelopes, endorsed "Tender for Council Schools at Wilmslow," must be delivered by 10 a.m. on Oct. 26, to George Leigh, clerk, union offices, Knutsford, Cheshire.

Oct. 26. DONAGHADEE (Ireland).—Alterations and additions to Methodist church and schools at Donaghadee, in accordance with plans and specifications, which may be inspected at the office of the architect, or on the school premises, Donaghadee. Quantities may be obtained from S. C. Hunter, on payment of two guineas. Sealed and endorsed tenders must be delivered by Oct. 26, to J. St. John Phillips, A.R.I.B.A., architect, 16, Donegall Square South, Belfast.

Oct. 27. MENSTON.—Erection of a villa residence at Menston, for Dr. W. J. Hyslop. Persons desirous of tendering must forward their names by Oct. 27, to Harold Chippendale, architect, Guiseley, when quantities will be forwarded in due course.

Oct. 27. PARK GATE, GUISELEY.—Erection of twelve houses at Park Gate, Guiseley, for Rev. Sir Peile Thompson, Bart. Persons desirous of tendering must send their names by Oct. 27, to Harold Chippindale, architect, Guiseley, when quantities will be forwarded in due course.

Oct. 27. NAIRN.—Mason, joiner, slater, plumber, and gasfitter, plaster and cement, glazier, smith, heating, and painter work of new free church to be built at Gordon Street, Nairn. Plans may be seen with John Buchan, Ashiestiel, Nairn, and schedules of quantities had on application to James Strang, architect, Falkirk, with whom sealed offers are to be lodged by Oct. 27, marked on outside of cover, "Tender for Church."

Oct. 28. LYMINGE.—Alterations to the vagrant wards at the workhouse, Lyminge, for the guardians of Elham Union. A specification of the work can be seen with R. Longergan, clerk, 11, Cheriton Place, Folkestone, where tenders are to be delivered before Oct. 28.

Oct. 28. TONREFAIL (Glam.).—Erection of a residence at Tonrefail, Glam., for Dr. D. Naunton Morgan. Plans and specifications can be seen at the Tonypandy and Pontypridd offices and bills of quantities obtained there, and also at the Cardiff office, 12, Edwards Terrace, on payment of £1 1s. deposit. Tenders to be delivered at Tonypandy office by noon on Oct. 28, endorsed "Tender for Tonyrefail House," addressed to W. Morgan Lewis and T. Naunton Morgan, Pontypridd and Tonypandy.

Oct. 29. DORCHESTER.—Alterations at the Holy Trinity infants' school, Grey's School Passage, Dorchester, for the managers. Plans, etc., may be seen at the office of the architect, J. Peacey, South Walks, Dorchester.

Oct. 29. SCUNTHORPE.—Erection of a fire station, highways depot, cart sheds, and public convenience at the corner of Mary Street, E., and Cole Street, for the U.D.C. Plans, sections, and details may be seen, and any further information given upon application to Walter F. Bickford, engineer and surveyor, Engineer's and Surveyor's Office, Home Street, Scunthorpe. Form of tender, general conditions, specifications, and bill of quantities may be obtained upon payment of two guineas. Tenders, sealed and endorsed "Tender for Fire Station, Buildings, etc.," to be addressed to F. C. Hett, clerk, 2, Trafford Street, Scunthorpe, and delivered by noon on Oct. 22.

Oct. 30. LONDON.—Erection of a shelter and store for model yachts, at Victoria Park for the L.C.C. Persons desiring to tender may obtain the drawing, specification (without bill of quantities), form of tender, and other particulars at the Architect's Department, 19, Charing Cross Road, W.C., upon payment of 10s. to the cashier of the council, at the County Hall, Spring Gardens, S.W. Full particulars of the work may be obtained on application at the County Hall, before the payment of the fee. Each tender is to be delivered in a sealed cover, marked "Tender for Shelter, etc.," Victoria Park," by 11 a.m. on Oct. 30, to G. L. Gomme, clerk to the London County Council, County Hall, Spring Gardens, S.W., Fair wages clause.

Oct. 31. LEEDS. — Erection of the firemen's dwellings and hose tower, in Park Street, for the Corporation. Contractors desirous of tendering must send their names, accompanied by a deposit of one guinea, to the architect, Percy Robinson, F.R.I.B.A., Yorkshire Post Chambers, 53, Albion Street, on Oct. 31, when bills of quantities will be forwarded. Tenders, endorsed "Firemen's Dwellings," must be delivered by Nov. 18, to Robert E. Fox, town clerk, town hall, Leeds.

Oct. 31. ABERDEEN.—Erection of a new booking office, etc., at the corner of Bridge Street and Guild Street, with steel footbridge and stairs to the west platforms, for the Aberdeen Joint Station Committee. The drawings may be seen at the office of James A. Parker, C.E., 80, Guild Street, Aberdeen, where copies of the specification and schedule may be obtained on payment of one guinea. Sealed tenders, endorsed "Tender for Booking Office," to be lodged by 10 a.m. on Oct. 31, with T. S. Mackintosh, secretary, Aberdeen Joint Station Committee, 80, Guild Street, Aberdeen.

Nov. 1. DRUMAGHLIS (Ireland).—Erection of a new National school. Plans and specifications may be inspected on application to John M'Robert, J.P., Rademon, Crossgar, or 13, Wellington Place, Belfast, by whom tenders will be received up to Nov. 1.

Nov. 2. DUBLIN.—Addition to and alteration in the General Post Office, Dublin, for the Board of Public Works. Plans and specification can be seen at the offices of the secretary. Forms of tender and bills of quantities will be supplied on deposit of £1. Separate envelopes containing the tender and the bill of quantities must be endorsed "Tender for Works at the General Post Office, Dublin," and delivered by 10 a.m. on Nov. 2, to H. Williams, secretary, office of public works, Dublin.

Nov. 2. LISBURN.—Construction of a masonry and brickwork arch bridge over the railway at Ballinderry Road level crossing, near Lisburn, for the directors of the Great Northern Railway Company (Ireland).—Parties wishing to tender may see the drawing and specification at the office of W. H. Mills, engineer-in-chief, Amiens Street, Dublin, or copies at the district engineer's office, Belfast, and can obtain at the offices lithographed copies of drawing and specification, also form of tender, upon payment of 10s. per set (not returnable). Tenders, on the forms supplied, should be delivered, under sealed cover, endorsed "Tender for Bridge near Lisburn," by 10 a.m. on Nov. 2, to T. Morrison, secretary, secretary's office, Amiens Street terminus, Dublin.

Nov. 4. NORTH FARNBOROUGH.—Erection of a new council school at North Farnborough, for the Southampton County Council. Persons desirous of tendering may see plans, specification, and conditions of contract, and obtain bills of quantities, and other information, at the office of W. J. Taylor, county surveyor, The Castle, Winchester, on and after Oct. 21, between 9 a.m. and 5 p.m. (Saturdays, 9 a.m. and 1 p.m.). A deposit of two guineas is required for the bills of quantities and form of tender. Deposits must

be made by cheque, payable to the Hants county council, and crossed "Bank of England." Tenders, endorsed "North Farnborough Council School," to be delivered by Nov. 4, to H. Barber, clerk of the county council, The Castle, Winchester.

Nov. 4. NORTH DALTON (near Murton). — Erection and completion of an engine house, boiler house, coal store, chimney stack, etc., at the North Dalton pumping station, near Murton, for the directors of the Sunderland and South Shields Water Company. Plans and specifications may be seen, and quantities and further information obtained upon application to Alfred B. E. Blackburn, Assoc.M.Inst.C.E., the company's engineer, at 29, John Street, Sunderland. Quantities will be supplied only to contractors tendering for the whole of the works, on personal application. A deposit of three guineas must be made. Sealed tenders, marked "North Dalton Pumping Station," must be delivered to the secretary, 29, John Street, Sunderland, by noon on Nov. 4.

Nov. 5. ASTON-CUM-AUGHTON.—Whole or separate tenders in the erection of heating chamber at Aston-cum-Aughton; fence for provided school, near Rotherham, for the West Riding Education Committee. Plans may be seen and bills of quantities obtained on application to the architect. Sealed tenders, properly endorsed, to be forwarded by 10.30 a.m. on Nov. 5, to J. Vickers-Edwards, county architect, county hall, Wakefield.

Nov. 10. CHELMSFORD.—Erection of a covered cowshed and construction of a roof over an auction ring in the cattle market, for the Corporation. Specifications, bills of quantities, forms of tender and full particulars may be obtained on deposit of £2 2s. The plan may be inspected at the borough surveyor's office, 16, London Road, on and after Oct. 26. Tenders, on the form provided, enclosed in sealed envelopes and endorsed "Market," must be delivered by 4 p.m. on Nov. 10, to W. Smith, town clerk, Municipal Offices, 16, London Road, Chelmsford.

Nov. 13. HULL.—Additions and alterations to cattle market under two contracts, for the corporation. No. 1, three reinforced concrete galleries of a total area of about 1,100 yds., together with alterations to existing concrete floors and other works; No. 2, new pens and hurdles and alterations to existing pens (weight of new iron and steel about 22 tons). Forms of tender and other particulars may be obtained of A. E. White, M.Inst.C.E., city engineer, town hall, Hull, on payment of £1 in respect of each contract. Blue prints of the plans for either contract will be supplied on payment of 5s. not returnable. Remittances must be made payable to T. G. Milner, city treasurer. Tenders, endorsed as directed on the forms of tender, to be addressed to the chairman of the markets committee and delivered at the town clerk's office, Hull, before noon on Nov. 13.

Dec. 1. RUAN, ENNIS, (Co. Clare).—Erection of a new church at Ruan, Ennis, Co. Clare. Tenders will be received by the Rev. J. Garry, P.P., up to Dec. 1. Drawings, specification, and bills of quantities may be seen at the Parochial House, near railway station, Ruan, or at the office of O'Malley and O'Rourke, architects, 10, Glentworth Street, Limerick.

No date. WEST LYNN.—Alterations to cottages at West Lynn, for Wm. Wing. For bill of quantities and all information apply to Walker and Walker, architects and surveyors, Wisbech and Terrington.

No date. BRADFORD.—Erection of new wheelwright's workshops, in Bowland Street, Bradford. Plans may be seen and quantities obtained upon application to H. Hardaker, architect, Ivegate Chambers, New Ivegate, Bradford.

No date. DEVIZES.—Erection of a stone wall in stream on Poulshot Road, also moving and repairing the post and rails, for the R.D.C. Specification and particulars to be had on applying to Jas. M. Butcher, Southbroom Terrace, Devizes.

No date. BAWTRY (near Doncaster).—Erection of a villa residence at Bawtry, near Doncaster. Persons desirous of tendering are requested to forward their names to Garside and Pennington, architects and surveyors, Pontefract and Castleford.

No date. TALYBOUT (Cardiganshire).—Erection of a new mission church at Talybont, Cardiganshire. Plans, specifications, and further particulars may be obtained on application to the architects, Deakin and Howard Jones, M.S.A., Plas Ynys, Borth, R.S.O.

No date. NANTWICH. — Erection of new schools in Hospital Street, Nantwich, for the Wesleyan Methodist school trustees. Bills of quantities and form of tender may be obtained from R. Matthews, architect, Parr's Bank Chambers, Nantwich, on payment of £1 1s.

No date. OLDHAM.—Erection of thirty-eight houses on the Hollin Hall Estate, Oldham, for the Oldham Equitable Co-operative Society, Ltd. Specifications, etc., may be obtained of the Society's architect, F. Thorpe, 7, Clegg Street, Oldham, on deposit of £2 2s.

No date. GLOSSOP.—Works in connection with new Conservative club and shops, Norfolk Street, Glossop. Contractors may see plans and obtain bills of quantities on application to John Eaton, Sons and Cantrell, architects and surveyors, Stamford Street, Ashton-under-Lyne.

No date. LLWYNYPIA.—Erection of a house at Llwynypia, for the Glamorgan Coal Company, Ltd. Plans may be seen at the offices of Edgar G. C. Down, A.R.I.B.A., architect and surveyor, 31, High Street, Cardiff, from whom bills of quantities may be obtained on deposit of two guineas.

No date. BRIXWORTH (Northants).—Erection of a bakery at Brixworth, for the Provident Co-operative Society, Ltd. Bills of quantities will be posted to contractors on application to A. H. Walsingham, architect, or C. E. Roberts and Co., bakery engineers, 62, Market Street, Manchester. Drawings may be seen at the Society's office.

ENGINEERING.

Oct. 22. GOOLE.—Constructing and sinking in the bed of the river Ouse a cast-iron casing cylinder (about 55 tons), for a new accumulator, and construction of an accumulator house, etc., at Goole swing bridge, for the North Eastern Railway. Plans may be seen, and specification, detailed quantities, and form of tender obtained on personal application at the office of W. J. Cudworth, the company's engineer at York. Sealed tenders, marked "Tender for Cast Iron Casing Cylinder, etc., at Goole Swing Bridge," to be addressed to R. F. Dunnell, secretary, and delivered at his office at York by Oct. 22.

Oct. 24. KIMPTON, WELWYN. — Heating Kimpton Church by the low-pressure hot-water system, including the construction of a new heating chamber for the vicar and churchwardens. Plans, etc., may be seen at the church upon application to the sexton.

Oct. 26. BAMBER BRIDGE (near Preston). — Sinking a pump head well and borehole, on the site of proposed pumping station, situated at Bamber Bridge, near Preston, for the U.D.C. of Walton-le-Dale. Persons desiring to tender must first submit their names to the clerk. Tenders, endorsed "Well Sinking," to be delivered by noon on Oct. 26, to W. S. Woodcock, clerk to the council, council offices, Bamber Bridge, near Preston.

Oct. 26. HAYFIELD.—Extension of the waterworks, for the R.D.C., as follows:—Part 1.—Providing and laying about half-a-mile of 3-in. cast-iron water main along the Glossop Road between Hayfield and Little Hayfield. Part 2.—Construction of a break-pressure tank on kinder bank, and providing and laying about three-quarters of a mile of 4 in. and 3 in. cast-iron mains in Hayfield, with all necessary connections and apparatus. Specification and drawings may be seen at the council offices, 16, High Street, New Mills, and schedule of quantities obtained from the engineers, George and F. W. Hodson, MM.Inst.C.E., Loughborough, on deposit of cheque for £2 2s. Tenders to be sent by Oct. 26 to J. R. Bowden, clerk to the council.

Oct 27. LONDON.—Supplying 12 water-tube boilers, with mechanical stokers and superheaters, etc., each boiler capable of evaporating 15,000lbs. of water an hour, for the L.C.C. Persons desiring to tender may obtain drawings, specification, bills of quantities, form of tender, and other particulars from the clerk of the council, upon payment to the cashier of £2. Tenders to be delivered in a sealed cover, to the clerk of the London County Council, Spring Gardens, S.W., marked "Tender for Water-tube Boilers," by 11 a.m. on Oct. 27. Fair wages clause.

Oct. 27. MIDDLESBROUGH.—Construction of a new bridge and approaches at South Bank, Middlesbrough, for the directors of the North Eastern Railway. The work comprises about 20,000 cubic yds. of earthwork, altering and erecting about 70 tons of existing steelwork to be provided by the company, and providing and fixing about 56 tons of new steelwork, and constructing the roadway over the bridge and the approaches. Plan and specification may be seen and detailed quantities and form of tender obtained on personal application at the office of W. J. Cudworth, the company's engineer at York, on and after Oct. 19. Sealed tenders, marked "Tender for Bridge and Approaches, at South Bank, Middlesbrough," must be sent by 9 a.m. on Oct. 27, to R. F. Dunnell, secretary, York.

Oct. 30. HALTON (Chester).—Construction of new Sewerage Works in the parish of Halton, Chester, for the Runcorn R.D.C. The works will comprise about 2¾ miles of 6in. to 12in. earthenware pipe sewers, together with all manholes, lampholes, and other appurtenances. Drawings and specifications may be seen, and quantities, form of tender, and all other particulars obtained on application at the offices of James Diggle and Son, civil engineers, Hind-hill-street, Heywood, or at the office of the clerk, on payment of two pounds. Sealed tenders endorsed "Tender for Halton Sewerage Works" to be sent by October 30th, to Geo. F. Ashton, clerk to the council, 71, High Street, Runcorn.

Oct. 31. PENYGRAIG.—Sinking a shaft 20ft. in diameter and approximately 500 yards in depth for the Naval Colliery Company (1897), Limited. Plans and specifications may be seen at the Naval Colliery Offices, Penygraig, between nine a.m. and five p.m. Tenders to be sent in before Oct. 31.

No date. WOOTTON BASSETT.—Construction of a dam, with puddle wall and other works in connection therewith, at Marsh Farm, Wootton Bassett, for Howard Horsell. Plans and specification may be seen with F. Redman, engineer for the work, 34, Wood Street, Swindon. The site may be inspected by arrangement with Mr. Horsell, Dudley House, Wootton Bassett, where tenders are to be delivered.

IRON AND STEEL.

Oct. 22. DUNDEE.—Supplying 25 tons of steel rails, tramway section, about 127 lbs. per yard, with fish plates and bolts to suit, for the trustees of Harbour of Dundee. Sealed tenders, marked "Tender for Rails," must be lodged by 10 a.m. on Oct. 22, with J. Hannay Thompson, M.Inst.C.E., harbour engineer, harbour engineer's office, Dundee.

Oct. 22. LLANDUDNO.—Supply and delivery to Llandudno Junction station of 488 tons (more or less) in No. 662, 15 in. by 12 ft. long cast iron spigot and socket pipes, for the U.D.C. Also about 14 tons of special pipes. Full particulars, with form of tender, may be obtained from E. P. Stephenson, Assoc.M.Inst.C.E., town hall, Llandudno. Tenders must be sent by Oct. 22, endorsed "Tender for Pipes," to A. Conolly, clerk to the council, town hall, Llandudno.

Oct. 26. BRYNMENYN (Glam.).—Supply and delivery of cast iron manhole covers (light and heavy), also cast iron sheet gulley gratings, for the Ogmore and Garw U.D.C. All to be made in accordance with the council's pattern, which may be seen at Brynmenyn. Full particulars and form of tender may be obtained from the council office, Brynmenyn, Glam. Sealed tenders, endorsed "Manholes," to be sent to S. H. Stockwood, Bridgend, by Oct. 26.

Oct. 26. LONDON (for India). — Supplying about 4,700 tons of 80. lb. Bessemer acid steel rails and angle fishing plates, for the Crown Agents for the Colonies, acting on behalf of the Government of Ceylon. Forms of tender and all particulars may be obtained on application at the office of the Crown Agents for the Colonies, between 10 a.m. and 4 p.m. (Saturdays 10 a.m. to 1 p.m.), on deposit of £1. Tenders to be delivered in sealed envelopes, addressed to the Crown Agents for the Colonies, Whitehall Gardens, S.W., endorsed "Tender for Rails and Fishplates, Ceylon Government Railways," by noon on Oct. 26.

Oct. 27. ISLINGTON.—Supply and delivery of galvanised wrought-iron shingle bins and cast-iron orderly bins, for the corporation. A specification and drawing of the shingle and orderly bins may be seen, and form of tender obtained, upon application to the borough engineer, J. Patten Barber, at the town hall, and deposit of £2 2s. Sealed tenders, endorsed "Tenders for Bins," must be delivered by 4 p.m on Oct. 27, to Wm. F. Dewey, town clerk, town hall, Upper Street, N.

Oct. 27. LONDON (for India).—Supplying (1) Steel rails and fishplates, about 700 tons; (2) tie bars, gibs, and cotters, about 38 tons; (3) fish-bolts, and nuts, and spikes, about 48 tons; (4) switches and crossings, 102 sets switches, 82 sets crossings, for the South Indian Railway Company, Ltd. Specifications and forms of tender may be obtained at the company's offices. Tenders, addressed to the chairman and directors of the South Indian Railway Company, Ltd., marked "Tender for Rails," or as the case may be, must be left by noon on Oct. 27, with V. E. De Broe, secretary, company's offices, 91, York Street, Westminster, S.W. A charge, which will not be returned, will be made of 20s. for each copy of specification No. 1, and of 10s. for each copy of Nos. 2, 3, and 4. Copies of the drawings may be obtained at the office of Robert White, 3, Victoria Street, Westminster, S.W., on payment of 5s. per sheet.

PAINTING.

Oct. 22. ST. BEES.—Painting and decorating the United Methodist church and schoolroom, St. Bees. Particulars on application to the secretary, E. J. Ireland, Manor Cottage, St. Bees, to whom tenders, sealed and addressed, should be forwarded before Oct. 22.

Oct. 23. HULL.—Painting the exterior of artisans dwellings, Great Passage Street, and 77 houses in New Bridge Road, Rustenburg Street, and Steynburg Street, in four contracts, for the corporation. Forms of tender and other particulars may be obtained at the office of A. E. White, M.Inst.C.E., city engineer, town hall, Hull. Tenders, endorsed "Tender for Painting Properties," to be addressed to the chairman of the property committee, and delivered at the town clerk's office before 10 a.m. on Oct. 23.

Oct. 24. BARROW-IN-FURNESS. — Cleaning, painting, etc., at the stores and stables, Ramsden Street, for the corporation. Bills of quantities and further particulars may be obtained at the borough engineer's office, town hall. Tenders to be delivered by noon on Oct. 24.

Oct. 26. HERTFORD.—Painting iron fencing at the cemetery for the corporation. For particulars, etc., apply to the borough surveyor.

PLUMBING & SANITARY

Oct. 22—Nov. 4. EASINGTON (Durham). — Construction of main sewerage and sewage disposal works for Thornley and Wheatley Hill R.D.C. The proposed works comprise furnishing and laying about 1,000 yards of 12, 9, 7 inch fireclay sewers with gaskin and cement joints with manhole and lamphole shafts, storm overflow chambers, bacterial tanks and filters, fencing, etc. Contractors desirous of tendering are requested to send their names and addresses by Oct. 22, to the engineers, D. Balfour and Son, civil engineers, S. St. Nicholas Buildings, Newcastle-on-Tyne, accompanied by a cheque for £5, after which full particulars and quantities will be forwarded. Contractors must furnish good and approved security for the due fulfilment of the contract. Sealed tenders, endorsed "Tender for Thornley and Wheatley Hill Sewage," must be sent by 10 a.m. on Nov. 4, to J. Morley Longden, clerk to the council, union offices, Easington, Castle Eden, R.S.O.

Oct. 23. CHISLEHURST.—Laying out, constructing, sewering and surface water draining a new road in Perry Street, Chislehurst, for the U.D.C. Forms of tender, with a copy of the specifications, can be obtained of the council's surveyor, at Hampden House, Station Road, Sidcup, on payment of £2 2s., in respect of each matter. Plans, sections, and conditions of contract may also be seen at the surveyor's office. Tenders, sealed and endorsed "Tender for ———," as the case may be, must be delivered by 4 p.m. on Oct. 26, to H. E. Knight, clerk of the council, council offices, Chislehurst. (See also "Miscellaneous.")

Oct. 26—Nov. 5. CRANLEIGH (Surrey). — Materials and labour in laying in about 1,278 yds. of pipe sewer, with manholes and flushing arrangements, in Horsham Road, Cranleigh, Surrey, for the Hambledon R.D.C. Plans, sections, specification, and conditions of contract, can be inspected at the office of the council's surveyor, Edward I. Lunn, 36, High Street, Guildford. Contractors desiring to receive bills of quantities must send their names and addresses to the surveyor, by Oct. 26, enclosing a deposit of £3 3s. Sealed tenders on the form supplied, must be delivered by 10 a.m. on Nov. 5, to Ferdinand Smallpiece, clerk to the council, 138, High Street, Guildford. Security or a bond, in the sum of £200 for the due performance of contract, may be required.

Oct. 27. STECHFORD (near Birmingham).—Construction of twelve rectangular brick and concrete sewage filters, each about 162ft. by 35ft., for the Yardley R.D.C. Also supply and wash-out chambers, distributing and effluent channels, subways, cast-iron carriers, and other works incidental thereto, at the Cole Hall Sewage Disposal Works, Stechford, near Birmingham, in accordance with plans, drawings, specification, and conditions which may be seen on application to the engineer and surveyor, Arthur W. Smith, at the council house, Sparkhill, near Birmingham, between ten and one and three and five (Saturdays ten and one). Specification, bill of quantities, and form of tender can be obtained on payment of three guineas to the clerk. Sealed tenders, addressed "The Yardley Rural District Council," and endorsed "Rectangular Filters," to be delivered by noon on Oct. 27, to Francis Ladbury Thompson, clerk of the council, Council House, Sparkhill, near Birmingham. The contractor shall give preference to workmen resident in Yardley. Fair wages clause.

Oct. 27. YARDLEY.—Provision and construction of the following foulwater sewers for the R.D.C.:—89 yds. of 9in. sewer in Yardley Road; 220 yds. of 9in. sewer in Warwick Road; 291 yds. of 9in. sewer in Weston Lane, together with manholes, lampholes, flushing chambers, and other works appertaining thereto, in accordance with plans, drawings, specification, and conditions of contract, which may be seen on application to the engineer and surveyor, Arthur W. Smith, Council House, Sparkhill, near Birmingham, between ten and one and three and five (Saturdays ten and one). Specification, bill of quantities, and form of tender may be obtained on payment of three guineas to the clerk. Tenders, endorsed "Sewer Extensions," to be delivered by noon on Oct. 27 to Francis Ladbury Thompson, clerk to the council, the Council House, Sparkhill, near Birmingham. The contractor shall give preference to workmen resident in Yardley. Fair wages clause.

Oct. 27. WATFORD.—Execution of works of drainage of Theobald Street, Boreham Wood, comprising about 1,230 yds. lineal of 12 in. and 9 in. pipe sewers, together with manholes and other necessary work. Also a short extension of main sewer, Shenley Road, Radlett (about 170 yds. lineal of 9 in. pipe), with manholes, etc., for the R.D.C. Plans and specification may be seen and a copy of the quantities obtained at the offices of the engineer to the council, Ernest Lailey, 9, Market Street, Watford, between 9 and 1, on deposit of two guineas. Sealed tenders, endorsed "Tender for Theobald Street Drainage," or "Tender for Extension of Sewer Radlett," must be delivered by 4 p.m. on Oct. 27, to H. Morten Turner, clerk to the council, Watford Place, Watford.

Nov. 2. OMBERSLEY (Droitwich).—Construction of about 933 yards of stoneware pipe sewers, with manholes and other work incidental thereto, in the village of Ombersley, for the R.D.C. Drawings and specification may be seen, and quantities obtained, on application at the offices of H. W. Smith, surveyor, 12, The Foregate, Worcester. Tenders to be sent by Nov. 2 to Arthur J. Bearcroft, clerk to the council, Union Office, Droitwich.

Nov. 3. EGREMONT.—Cutting trenches and laying and jointing about 420 lineal yards of 7in. steel sewerage pipes at Egremont, for the U.D.C. Plan and specifications can be seen and any other information obtained on application to James Cowan, surveyor, town hall, Egremont. Sealed tenders, endorsed "Sewerage Pipe Track," must be delivered by noon on Nov. 3, to John Bowley, clerk to the council, town hall, Egremont.

ROADS AND CARTAGE.

Oct. 22. HARROGATE.—Private street works required in a portion of Prospect Place, for the Corporation. Specification may be seen, and quantities obtained of F. Bagshaw, borough engineer and surveyor. Tenders must be submitted by 9 a.m. on Oct. 22.

Oct. 23. BRIGHTON.—Supplying 4,500 cubic yards of land flints for highways required during the period to the 31st March, 1909, for the Corporation. Specification and form of tender may be obtained on application at the office of the borough surveyor, town hall, Brighton. Sealed tenders, endorsed "Tender for Flints," must be delivered before 10 a.m. on Oct. 23, to Hugo Talbot, town clerk, town hall, Brighton.

Oct. 23. RHONDDA.—Paving, kerbing, channelling, etc., the following streets under the Private Street Works Act, 1892, for the Rhondda urban district council. 1, Old Street, Blaenclydach; 2, Charles Street, Blaenclydach; 3, Fern Terrace, Blaenclydach; 4, Maddox Street, Blaenclydach; 5, Jones Street, Blaenclydach; 6, Railway Terrace, Blaenclydach; 7, North Terrace, Blaenclydach; 8, Cross Street, "A," Blaenclydach; 9, Cross Street "B," Blaenclydach; 10, Trealaw Road, Trealaw (ballasting and metalling of roadway, etc.). Plans may be seen and form of tender obtained at the office of W. J. Jones, engineer and surveyor, public offices, Pentre, Rhondda, on payment of one guinea. Tenders must be delivered under seal, endorsed with the name of the contract, and addressed to the chairman of the council, public offices, Pentre, Rhondda, and delivered by 10 a.m. on Oct. 23. Fair wages clause.

Oct. 24. DEVONPORT.—Levelling, paving and completing (under section 150 of the Public Health Act, 1875) the following lane, for the Corporation. Contract No. 136.—Lane at rear of Nos. 24 to 33, Avondale Terrace. Plans, specifications, and conditions may be seen and forms of tender and bills of quantities obtained at the surveyor's office, on payment of £1 1s. for each set of quantities. Separate sealed tenders must be delivered by Oct. 24, to John F. Burns, borough surveyor, Municipal offices, 29, Ker Street, Devonport.

Oct. 26. WESTON-ON-AVON. — Regravelling the playground at Weston-on-Avon council school, for the managers. Persons desirous of tendering may obtain further information upon application to Francis L. Thompson, 42, Greenhill Street, Stratford-on-Avon.

Oct. 26. WEDNESBURY.—Levelling, paving, metalling, flagging, channelling, and making good Longcroft Avenue, between Vicar Street and Clarkson Road, for the Corporation. Plans, sections, specification and conditions of contract may be seen, and bills of quantities and form of tender obtained, on application to the surveyor. Tenders, endorsed "Longcroft Avenue," must be delivered by Oct. 26, to E. Martin Scott, borough engineer and surveyor, town hall, Wednesbury. Fair wages clause.

Oct. 26. STONE, DARTFORD. — Making up Charles Street, in the parish of Stone, for the R.D.C., in accordance with plans and specifications which have been prepared under the direction of the council's surveyor, and may be seen and forms of tender obtained at the office of W. Harston, A.M.I.C.E., 8, Hythe Street, Dartford, between 11 and 4; Saturday, 11 and 1. Quantities may also be obtained from W. Harston, on deposit of £2 2s. Tenders, in envelopes, endorsed "Tender for Private Street Works," must be delivered by 10 a.m. on Oct. 26, to J. C. Hayward, clerk, Sessions House, Dartford. The person whose tender is accepted will be required to enter into contract for the due execution of the works, and a bond for ensuring the performance of the contract with two sureties.

Oct. 27. BROMLEY.—Sewering, levelling, paving, metalling, channelling, and making good Farnaby Road for the corporation, in accordance with the plan, sections, and specification, which may be seen, and bills of quantities, etc., obtained, at the office of the borough engineer, on deposit of 10s. at the town clerk's office. Tenders, endorsed "Farnaby Road," must be delivered by 3 p.m. on Oct. 27, to Fred H. Norman, town clerk, municipal offices, Bromley, Kent.

Oct. 27. WEALDSTONE.—Supply of 400 tons of granite, broken to 2 in. gauge, and 40 tons of granite chippings, the whole to be delivered in trucks as directed at Harrow and Wealdstone Station (L. and N.W. Railway), for the U.D.C. Samples of material to be supplied must be forwarded to Herbert Walker, C.E., council's surveyor, Wealdstone. The contractor will be required to enter into the usual contract for the due performance of the tender. Sealed tenders, endorsed "Granite," to be sent by 7 p.m. on Oct. 27, to R. J. Bryant, clerk, council offices, Wealdstone.

Oct. 27. YARDLEY.—Masons', paviors', surface water drainers' and road widening, kerbing, channelling, and paving works, for a period from 1st Nov., 1908, to 31st Mar., 1909, for the R.D.C. Specification, conditions of contract, schedules, and forms of tender may be obtained on application to Arthur W. Smith, engineer and surveyor to the council, Council House, Sparkhill, near Birmingham, between ten and one and three and five (Saturdays ten and one), on deposit of three guineas to the clerk. Sealed tenders, addressed "The Yardley Rural District Council," and endorsed "Pavior's and Drainers' Works," to be delivered by noon on Oct. 27, to Francis Ladbury Thompson, clerk to the council, Council House, Sparkill. The contractor shall give preference to workmen resident in Yardley. Fair wages clause.

Oct. 27. GREAT YARDLEY. — Making up Knowle Road, Greet, within the district, under the Private Street Works Act, 1892, for the R.D.C. Plans, sections, specification, and conditions of contract of the proposed works can be seen, and bill of quantities and form of tender obtained on application to Arthur W. Smith, engineer and surveyor to the council, council house, Sparkill, near Birmingham, between 10 and 1 and 3 and 5 (Saturdays, 10 and 1), on deposit of one guinea to the clerk. The contractor shall give preference to workmen resident in Yardley. Sealed tenders on the prescribed form, addressed "The Yardley Rural District Council," and endorsed "Private Street Works," to be delivered by noon on Oct. 27, to Francis Ladbury Thompson, clerk to the council, Council House, Sparkhill. Fair wages clause.

Nov. 3. BRENTFORD.—Supply and delivery of 1,500 tons of best hard Guernsey granite spalls for the union guardians. Forms of tender may be obtained upon application, and tenders must reach William Stephens, clerk to the guardians, union offices, Isleworth, W., before four p.m. Nov. 3.

Nov. 9. STEYNING (Sussex).—Supplying 250 tons of broken granite or basalt, and 50 tons of chippings, to be delivered at the Aldrington Basin, near Brighton, or to Hove railway station, before February 1, 1909, for the East R.D.C. Forms of tender, giving full particulars of the materials required, can be obtained on application to the surveyor of the council, G. W. Warr, town hall, Southwick. Tenders must be delivered by Nov. 9, to Arthur Flowers, solicitor and clerk to the council, council offices, New Shoreham, Sussex.

No date. MAINDEE (Newport).—Formation of new roads, sewers, etc., on the Maindee Estate, Newport, for the directors of the Maindee Estate Company, Limited. The Conscientiousness of Councils.

Everybody has admired the superb conscientiousness of the village constable who arrested himself in the act of obstructing himself in the execution of his duty; and it is understood to be a comparatively common occurrence for a coroner to fine himself smartly, or at least to let himself off with a severe reprimand, when he arrives unduly late at an inquest. Equally familiar is the dilemma of a still rather famous Lord Chancellor who (in comic opera) contemplates the possibility of being compelled to commit himself for contempt of his own court. Hardly less farcical is the psychical problem suggested by a case that came before the magistrate at the South-Western police-court the other day, when, in effect, the London County Council summoned itself for not giving itself notice of its own intention to build. A matter of such gravity and complexity was not to be settled offhand. The magistrate went home to think over it. Less bewildering, but hardly less entertaining, is the reported discussion of by-laws at a recent meeting of the Thames Ditton District Council. The chairman moved that certain of the Council's stables should be made to conform to the Council's by-laws. He was supported by a member, who pointed out, with as much magnanimity as acumen, that "it was inconsistent to compel other people to comply with the by-laws when the Council itself failed to do so.' Then uprose a councillor who "thought the chairman was putting the cart before the horse, inasmuch as it had been proposed to alter the by-laws so that such buildings as those under discussion would conform to them." This equine argument, being as forcible as original, so strongly impressed the chairman, that he at once withdrew his motion, contenting himself with the mild protest that "they were not necessarily going to amend the by-laws so that their buildings would conform to them." Not necessarily!—but what a contrast in tone and attitude between the two councils!—the one practising the most rigorous austerities, the other disposed to be very kind and tender to itself. The really rational course seems to lie somewhere near the midway of these two extremes of severity and lenity; but how many builders (of sorts) will sigh regretfully at the manifest impossibility of establishing, in these iron times, and outside the confines of urbane Thames Ditton, the comfortable—and not essentially heterodox—doctrine, that when the building and the by-law are in conflict, it is the by-law that should be altered.

Against Works Departments.

Simultaneously with futile attempts at recent meetings of the London County Council to fan into flame the embers of the virtually extinct works department, Mr. J. Davidson, secretary of the Yorkshire Centre of the Federation of Building Trades Employers, delivered a smashing blow at the general system and practice of municipal trading. His paper, read before a meeting of the organisation with which he is connected, contains, however, neither rhetoric nor invective; its crushing weight is made up of solid facts and sound deductions, which are all the more impressive from the temperate and courteous manner in which they are presented. He shows, by a formidable array of convincing examples, that municipal trading, however specious in theory, constantly breaks down hopelessly in practice, and that the municipal works department is essentially uneconomical to the ratepayer, unfair to the contractor, and demoralising to the workman. The paper is, in our estimation, of considerable value and importance as a clear, concise, and cogent statement of the case against municipal works departments. We have therefore much pleasure in reproducing it in another part of the present issue.

"Beyond the Dreams of Avarice."

The Llandyssul Rural District Council has, so we learn from the "Welsh Gazette," been having trouble with its building surveyor. Llandyssul, we gather, is a peaceful agricultural district in Carmarthenshire, and we are glad to have the information. We plead guilty to previous ignorance of this interesting place, and its still more interesting Council. But now that we can claim cognisance of Llandyssul, through the medium of our excellent contemporary, we hasten to condole with the local legislators in their unmerited difficulties. For the peaceful vale of Llandyssul—our information does not mention a vale, but it sounds poetic—is rent in twain. The placid course of local government has been disturbed; the dignity of elected rulers has received a shock. The surveyor resigned! The reason for this unprecedented step is not vouchsafed to us. Perhaps he was bored by the Council; perhaps their relations had become strained and blasé. There are times when even the best of friends must part. Never would we venture to suggest that he could become dissatisfied with a post that carried with it the munificent salary of £5 a year. And yet there is a hint that such might be, nay! really was, the case. Fearful that the breaking of the old ties might "cause unpleasantness between him and the Council," the late surveyor made a still later repentance. "As several members had promised to support his application for an increase of salary at the end of the (three years') term," he decided to apply for reappointment. But the wounded feelings of the Llandyssul Rural Council were not to be thus appeased. They had three other candidates in the running; and had, moreover, to procure them, incurred the expense of an advertisement in our contemporary. As one of the councillors aptly remarked: "They had been put to all this bother of appointing by Mr. Bowen." So they elected one of the other candidates by six votes to four. "The manner in which Mr. Bowen had sent in his resignation," as another councillor stated, "was enough for him to vote against him." Poor Mr. Bowen! By one small act of temerity to have forfeited the affection of the Llandyssul Rural Council—and a salary of £5 a year. Truly, if we could foresee the results of our actions, how slow should we be, sometimes, to act. Meanwhile his successor reigns in his stead. And deep peace broods once more over the vale—there must be a vale—of Llandyssul.

Sheffield's Impossible By-laws.

It has been stated, perhaps rhetorically both as to the time and the judgment, that a committee of Sheffield Corporation have spent seven years in producing a code of by-laws of which several are "impracticable and impossible." It would seem as if too protracted a brooding had addled the eggs. The general opinion of them is, according to "a Sheffield architect of the highest standing," "that these by-laws have been made as stringent as it was possible to make them. It almost looks as if someone had collected copies of the by-laws from all over the kingdom and culled from them the most drastic regulations they could discover." With this opinion the associated master builders of the city are apparently in substantial agreement, for they have lodged a strong protest to the effect that the proposed new by-laws would, without conducing in any way to public health or public benefit, greatly increase the cost

of building, and thus "most unnecessarily cripple an industry which has suffered, and is still suffering, from severe depression." The proposed by-laws, it is asserted, would render impossible the erection of very cheap dwellings, and would strongly tend to discourage the alteration or rebuilding of business premises. Some of the points to which objection has been raised are (1) unnecessary thickness of walls both in commercial and domestic buildings; (2) unnecessary strength of timbers; (3) inadequate provision for temporary buildings—in many cases temporary buildings would not be allowed at all; (4) insufficient distinction between roads intended for main thoroughfares and those for back streets; (5) impracticable regulations as to street line for new buildings; (6) no provision for compensation where properties are set back; (7) rule as to area at back of buildings for the ventilation of water-closets so stringent that it will seriously affect town buildings. The owner of a large block of buildings in a narrow street has declared that insistence on the proposed new building line would rob him of 15ft. of depth, and he adds that it would not greatly astonish him to find that in some instances the building would be entirely eliminated. This opinion is hardly more grotesque than the by-laws that have provoked it. The committee have no doubt acted in good faith, and with the best intentions. But while it is impossible to withhold sympathy from their aspirations for the soundness and salubrity of their city, it is nevertheless a duty to protest against the employment of means towards that end that have been shown to be harsh, arbitrary, and unnecessary. The new by-laws have been referred back, in spite of the illogical contention that, having been seven years in incubation, they should now be rushed through without further consideration. Why this belated haste? That the (so far) most effectual protest has been made by the associated master builders of the city is one more striking proof of the benefits of organisation. But why were not these by-laws submitted to them in draft? Clearly the expert advice of such a body is well worth having; and it is surely better to have it in advance of the scandal.

THE HOLBORN NEW TOWN HALL.

This building has been erected at the junction of High Holborn and Broad Street, adjoining the Holborn Public Library, with which it forms one building when seen from the street. Although the library heights are followed in the elevations, the old offices of the Borough Council are retained intact in the new plan, and have been used by them throughout the execution of the work, without the necessity of their finding temporary office premises. Internally each floor has a large circular hall adjoining the main staircase, and in which a passenger lift is provided to all floors. The Council Chamber (see page 331) on the second floor, is in a quiet position, free from the noise of all traffic. A gallery for the public is provided, entered by a separate staircase from the street. On the same level as the council chamber are the committee rooms, mayor's parlour, and ante-room. Immediately under the council chamber is the court room, in which the magistrates will

THE HOLBORN BOROUGH COAT OF ARMS, EXECUTED IN CAST-IRON BY THE BROMSGROVE GUILD.

hear licensing and other business, and where rating assessment will be conducted. Enquiry and waiting rooms are planned close to the court.

The remainder of the building is occupied by the borough officials, whose departments are in each case self-contained. Service lifts for food and books are provided from the housekeeper's rooms on the fourth floor to the strong rooms in the basement, with a servery on each intermediate floor.

The floors of the entrance and other halls are laid by Diespeker, Ltd., in their patent veined marbles and marble granite, and the staircase has been constructed in the same material, the dado being carried out in the firm's veined marble, verd antico, and Arnialto panels. The service stairs and landings of artificial stone, the main staircase structure of ferro-concrete, and the whole of the granolithic paving, have been executed by F. Bradford and Co. Bratt, Colbran and Co. supplied their heaped fire grates; R. E. Pearse and Co., Ltd., the metal casements; and J. W. Singer and Sons, Ltd., of Frome, the whole of the electric light fittings. The lift was made by Messrs. R. Waygood and Co., Ltd., the lift enclosure being the work of The Bromsgrove Guild, who are also responsible for the entrance gates and the wrought-iron balcony on the front, the centrepiece being the borough coat of arms, which we illustrate, executed in cast-iron, and a rather remarkable piece of work. Shanks and Co. supplied the sanitary fittings, and Charles Smith, Sons and Co., Ltd., the door locks and furniture. The stone carving and the panelling and seating in the council chamber are the work of H. H. Martyn and Co., Ltd., of Cheltenham. The building contract was entrusted to John Greenwood, Ltd., the architects being Warwick and Hall, of South Square, Grays Inn.

It will be noted that, in the design of the front elevation, the architects have endeavoured to preserve the general massing of the older library building, to which the new structure is in the nature of an addition. The detail, however, differs considerably in character from that on the library building.

The building was formally opened on October 13th, 1908, by the Lord Mayor of London, Sir John Bell. The Bishop of London took a prominent part in the ceremony, and the Mayor, Lieut.-Col. Lacy W. Ridge, entertained the guests.

ARCHITECTURAL SOCIETIES.

R.I.B.A.

The first ordinary general meeting of the session 1908-09 will be held at 9, Conduit Street, on Monday, November 2nd, at 8 p.m. Mr. T. E. Collcutt, past presi- subscribers, formally present to the Institute the portrait of Mr. John Belcher, A.R.A., president 1904-06, painted by Frank Dicksee, R.A., hon. Associate R.I.B.A. Mr. Ernest George will deliver his presidential address. The following gentlemen are nominated for election at this meeting:—

AS FELLOWS.

Allen, G. P., London; Barnard, L. W., Cheltenham; Bidwell, R. A. J., Singapore; Cotman, G., Norwich; Heathcote, C. H., Manchester and London; Heathcote, E. G., Manchester and London; Martin, F. W., Birmingham.

AS ASSOCIATES.

Baird, W., London; Bromhead, F. H., Letchworth, Burgoine, S., London; Burlingham, A. C., Evesham; Cable, J. S., London; Clark, C. W., London; Colthuret, W. B., Taunton; Crampton, A., Southport; Ditchburn, D. W., Leytonstone, Essex; Dixon, R., Birmingham; Dyke, D. N., London; Edwards, A. C. M., Byfleet, Surrey; Emerson, H. V. M., London; Epps, W. M., London; Farrow, G. R., London; Forsyth, C., Glasgow; Gravenor, H. J., Montreal, Canada; Green, E. R., Sydney, N.S.W.; Holt, H. G., London; Jefferies, H. G., London; Jeffrey, J. McNee, London; Langman, F. W., London; Loveluck, E., Bridgend; Meakin, F., Chellaston, near Derby; Milne, D., London; Mitchell, W. H., Sale; Osborne, F. J., Birmingham; Phipp, R. A. H., Manchester; Sayner, J. H., London; Scott, J. M., London; Smithers, A., London; Stelfox, A. W., Belfast; Taylor, S. P., Harrow; Truelove, J. R., London.

The Society of Architects.

At the annual general meeting, on Thursday, October 15th, 1908, the follow-

ing officers and members of the Council were elected for the year 1908-9:—

PRESIDENT.

Bond, Geo. E., J.P., Rochester.

VICE-PRESIDENTS.

James, Cholton, F.R.I.B.A., Cardiff; Tubbs, Percy B., F.R.I.B.A., London.

HONORARY SECRETARY.

Marsland, Ellis, London.

HONORARY TREASURER.

Tucker, B. R., London.

HONORARY LIBRARIAN.

Mead, C. H., M.R.San.Inst., London.

COUNCIL.

Adams, Henry, M.Inst.C.E., London; Bare, R. Geo., London; Bartlett, James, London; Butler, R. M., F.R.I.B.A., Dublin; Corby, J. B., F.S.I., Stamford; Davies, R. Cecil, Chester; Emerson, H. V. Milnes, A.R.I.B.A., London; Hawker, H. E., F.S.I., Bournemouth; Jack, R. A., London; Leest, E. M., J.P., Devonport; Leslie, Col. F. S., R.E., Woolwich; Matthews, H. W., Bath; Middleton, G. A. T., A.R.I.B.A., London; Monson, E. C. P., F.R.I.B.A., London; Murgatroyd, A. J., Manchester; Partridge, E. J., F.S.I., Richmond; Sadgrove, E. J., F.R.I.B.A., London; Trew, J. Fletcher, Gloucester.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION
Oct. 31	BURY. NEW SECONDARY SCHOOL for the Education Committee. Premiums of £50, £25, and £10. Particulars and site plan from Robert Wilkinson, Director of Education, 8, Bank Street, Bury. Deposit £1 1s.
Oct. 31	*ROMFORD. COUNTY HIGH SCHOOL FOR GIRLS. Applications for Conditions to D. T. Williams, 71, South Street, Romford, Essex, to be made by or before August 24th, accompanied by deposit of five guineas, of which sum five pounds will be returned on receipt of bona fide design.
Nov. 1	CARDIFF. COUNTY HALL AND OFFICES. Particulars and site plan from T. Mansel Franklen, Clerk, Glamorgan County Council Offices, Cardiff.
Nov. 9	*WHITLEY AND MONKSEATON URBAN DISTRICT COUNCIL.—Public Shelter to seat 1,000, and provide promenade accommodation for another 400, at a cost of £1,200. Premium of £20 to merge if successful design is carried out. The Council (with such advice as they may decide to obtain) will be sole arbiters. Particulars from J. P. Telford, Acting Surveyor to Council, may be obtained at his Office, Council Buildings, Whitley Bay, any week-day (except Saturday) between the hours of 10 and 11 a.m., and 4 and 5 p.m. Design, plan and estimate, in sealed covers, to be sent to the Clerk to the Council, Council Buildings, Whitley Bay.
Nov. 14	WHITEHAVEN. NEW PUBLIC ELEMENTARY SCHOOL. Irish Street, for 700 children. Limited to Cumberland architects. Plan of site and conditions from W. D. P. Field, Secretary, Education Committee, Town Hall. Whitehaven. No statement as to premiums or deposit.
Dec. 1	POSTER FOR BUILDING EXHIBITION, OLYMPIA, April 17th to May 1st, 1909. Premium £105. Open to Architects and Architectural Students only. Particulars and entry forms from H. Greville Montgomery, M.P., Exhibition Offices, 43, Essex Street, Strand, London.
Dec. 14	BLACKPOOL. CENTRAL PUBLIC LIBRARY.—Premiums of £52 10s., £31 10s. and £21. Particulars and site plan from T. Loftos, Town Clerk, Town Hall, Blackpool. Deposit £1 1s.
Dec. 19	WHITTINGHAM. ANNEXE TO ASYLUM FOR PAUPER LUNATICS, for the Lancashire Asylums Board. Limited to Architects who are in practice and are ratepayers in the County of Lancashire. The new building is to accommodate 700 Inmates. Premiums of £100, £50, and £25. Particulars and plan of site from Leonard Colman, Law Clerk to Committee of Visitors, 8, Lune Street, Preston. Deposit £5 5s.
Dec. 31	*CORNWALL COUNTY OFFICES.—Designs and *Estimates* invited. Premiums of £50 £20 and £10. Premium for successful design to merge in Commission. Particulars from C. L. Cowlard, Clerk to County Council, Bodmin. Deposit, £1 1s.

** These competitions have been unfavourably reported upon by Correspondents.*

The Reformation Memorial at Geneva.

The result of the international competition for the above has now been announced. The jury consisted of Professor Gull, of Zurich, who presided; MM. A. Bartholomé, sculptor; Ch. Girault, Membre de l'Institut de France; Professor Bruno Schmitz, George J. Frampton, R.A. (appointed by the President R.I.B.A.), Alfred Cartier, Horace de Saussure, and Lucien Gautier. MM. Charles Borgeaud and Victor van Berchem were delegated by the promoters to assist in a consultative capacity. Seventy-one designs had been sent in. Five of these were received after the time fixed by the conditions, but the jury decided to admit them, reserving to themselves the right to consider more fully the question of their admission should any of them find place among the designs set aside for final selection. The first prize (10,000 francs) was awarded to No. 52, under the motto "Le Mur." The jury were unanimous that this design offers the best solution architecturally, possessing as it does that character of dignity and severity which the memorial should present, and by reason also of its adaptability to the site given and the distribution of the sculpture. The models of the figures, however, lacked the fine sculptural qualities present in some of the other designs, notably Nos. 41, 26, and 18, and the jury advise arrangements being made with the authors of these designs in order that the best sculpture the competition has called forth may be available for the monument.

The authors of No. 52, the selected design, are MM. Monod and Laverrière, architects (Lausanne); Taillens and Dubois, architects (Lausanne); Reymond, sculptor (Paris).

The second prize (6,000 francs) went to design No. 41, whose architectural, and especially sculptural, qualities were commended; the authors are MM. H. P. Nénot, architect; Paul Landowski, sculptor; and Henri Bouchard, sculptor, all of Paris.

Prizes of 2,000 francs were awarded to design No. 1, Guido Bianconi, sculptor (Turin); No. 2, Paul Becher, sculptor (Berlin); No. 3, Edmond Fatio, architect (Geneva), aided by Adolphe Thurs, architect (Paris), and A. Seysses, sculptor (Paris); No. 18, H. Janos, sculptor (Budapest); No. 26, Charles Plumet, architect (Cirey, France), and De Niederhausen Rodo, sculptor (Berne); No. 27, P. Heurtier, architect (Paris), collaborator G. Thorimbert, and F. Sicard, sculptor (Paris), collaborator L. Baralis; No. 32, Jean Fiault, architect, and André Vermare, sculptor, both of Paris.

New Parish Council Chambers, Bellshill.—At a meeting of the committee of Bothwell Parish Council, Mr. John G. Morton, 121, St. Vincent Street, Glasgow, was appointed architect for the work, his design having been placed first by the assessor, Mr. Ninian MacWhannell, architect, Glasgow. There were 29 designs submitted, and the following is the list of the other commended designs placed in order of merit by the assessor:—Crawford and Sutherland, Uddingston; W. Baird, Bellshill; R. Ewan, Glasgow; A. Mitchell, Coatbridge; J. Boyd, Glasgow. The buildings are estimated to cost about £2,000.

The Cornwall County Hall Competition we refer to in "Architects and Public Bodies."

Views and Reviews.

"The Decorator."

The sixth yearly volume of the "Decorator" deals authoritatively and luminously with every phase of modern practical decoration. The most casual glance through its pages reveals the value and importance, technically, artistically, commercially, and, it may be added, socially—for decorators are here revealed as a very clubbable fraternity, with an amiable weakness for flocking to conventions and getting themselves photographed in groups—of this excellent periodical to the art-craftsman to whose service it is dedicated. It is no doubt highly educative, and, from cover to cover, it is decidedly interesting from many points of view.

"The Decorator": An Illustrated Monthly Magazine for the House Painting, Decorating, and Kindred Trades. Edited by Arthur Seymour Jennings. Volume VI., July, 1907, to June, 1908. London: The Trade Papers Publishing Co., Ltd., 36, Birkbeck Bank Chambers, High Holborn, London, W.C. Price 7s. 6d.

THE GOLDEN AGE OF HELLENIC ART.

In art, as in other intellectual pursuits, the Greeks had the wisdom to learn from nations whose civilisation was older and more developed than their own. The first Greek artists thus borrowed largely from the well-defined traditional styles exemplified in the sculpture and architecture of the Egyptians, and also, although to a far less extent, from the rich decorative art of the Babylonians and Assyrians. Mere slavish imitation, however, was foreign to Greek nature, and the architectural models bequeathed to them by the founders of these earlier civilisations were by no means adopted in their entirety. Each ornament, each separate part of a structure, became in the hands of the Hellenic artist the centre of a fresh conception which was embodied in a type of design that was purely *Greek*. In like manner sculptors and painters dealt with the hitherto universally accepted conventional rendering of the human form, and in this they received considerable assistance from the customs of their country. The gymnasium itself was a school of art. Here the nude form was visible at all times in marvellous perfection and in every pose, and thus, ever present to the eye, it was studied and understood as perhaps it has never been since either studied or understood to quite the same extent. The Greek sculptor was thus able to obtain that deep and comprehensive grasp of nature which enabled him to mould many of his presentments of humanity in that living form which has caused his work to remain for countless ages a perennial subject of wonder and delight.

As art was thus fostered by nature, so nature, in turn, was sustained by art. But it was not until after the conclusion of the Persian wars that the development of Greek art received its mightiest impulse. Before that time it had been somewhat uncouth, more or less traditional in treatment, and its period of perfection did not really set in until the Athenians obtained supremacy among the states, and their city thus became the centre of the intellectual activity of the nation.

Then indeed Greek sculptors met and overcame the difficulties of representing human attitudes, costumes, and features in a natural and realistic manner, and

their masterly groupings of men and horses, either in processions or contests, created a subtle illusion of life and movement hitherto almost unknown in any epoch of art.

Pericles and Phidias.

The best period of Greek art commences with the advent to supreme influence of Pericles (B.C. 461), whose policy was based upon an endeavour to realise two great objects, namely, the formation of a continental empire under the supremacy of Athens, and the improvement of the city itself, which he destined to become the chief home of Hellenic literature and art. Although Pericles failed to achieve his former object, the latter succeeded beyond his most sanguine expectations, and under his auspices Athens became the centre to which artists and men of learning instinctively turned. All that money could command, and genius and learning could bestow, was lavished upon Athens. A splendid harbour was constructed, and many magnificent buildings were erected in the city, and the names of Phidias, Myron, Polycletus, Ictinus, Mnesicles, and other artists who laboured to adorn their city will ever be associated with this golden age of Greek art.

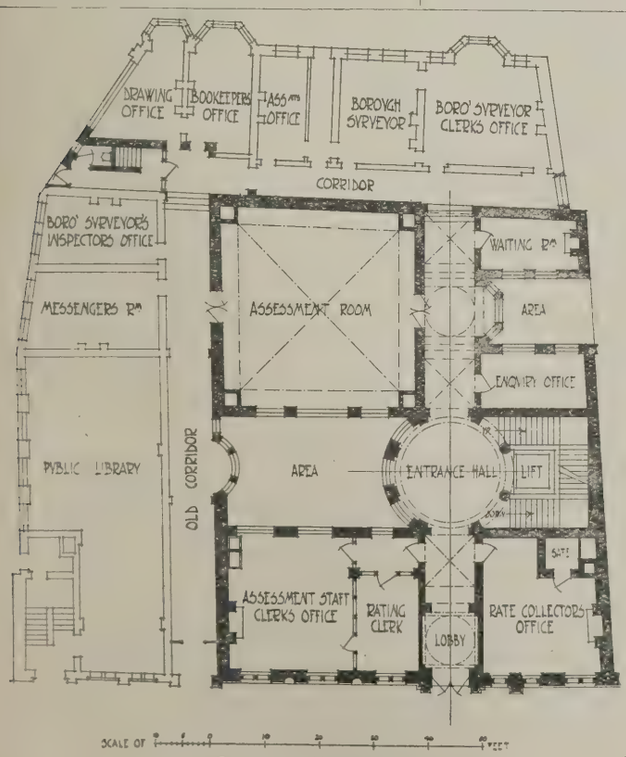
It is understood that Phidias had control of the works suggested by Pericles and his advisers for the adornment of the city, and although various architects were engaged, yet it was he who added the crowning glory of the buildings, represented by the beautiful statuary and carvings with which they were enriched. The much-admired figures in the friezes, pediments and metopes of the Parthenon were executed by Phidias, or by those of his school who were working under him, and the colossal figure of Athena Promachos—the bronze statue which towered above the Parthenon—was also due to his prolific genius.

Of other well-known buildings at Athens the Propylæa, at the entrance of the Acropolis, was not commenced until towards the end of the period with which we are dealing, but the Erechtheium, the splendid double temple which took its name from the mythical King Erechtheus, dates from the time of Pericles, and to the same age belong the Odeum, the temple of Athena Nike, and the Theseum.

The streets and colonnades of Athens were adorned with Hermae, and with monuments of every conceivable kind and form. A whole street, that leading from the Dionysian theatre, hollowed out of the southern rock of the Acropolis, was filled with memorials erected to the men who had produced (or stage-managed) the plays which year by year were adjudged the best. One such memorial is still extant in the circular domed structure of Pentelic marble adorned with columns of the Corinthian order known as the Choragic Monument of Lysicrates.

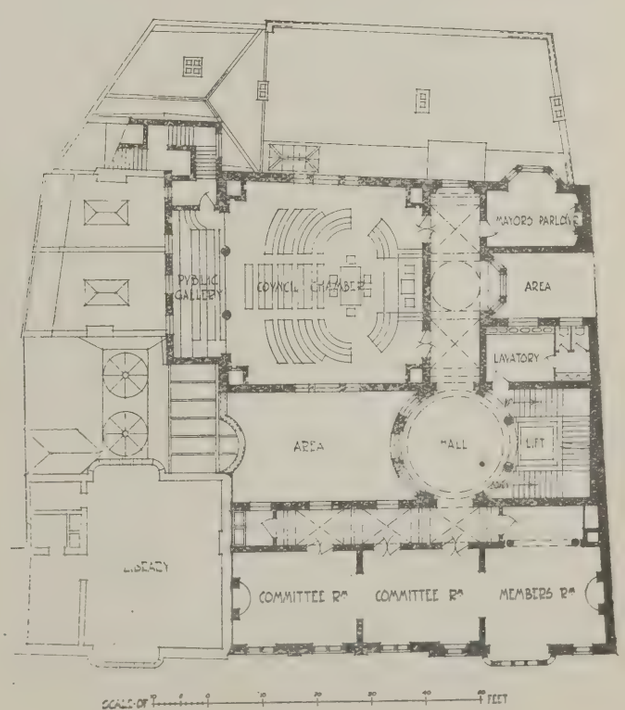
Greek Painting.

The sister art of painting also contributed to the embellishment of the city, and although there are no means of comparing the art of the contemporary painter with that of the architect and sculptor of the time of Pericles, we know that the Theseum, the Propylæa, and the Temple of the Dioscuri were all adorned with paintings by Polygnotus and other artists, representative of episodes in Athenian history.



The Great Sculptors.

Of the sculptors of the epoch, the merit of having first presented the human form complete to its minutest detail, and absolutely correctly fashioned and proportioned, is said to belong to Polycletus, whose Doryphorus, long upheld as a brilliant example of the master's genius, was hence surnamed the *Canon*. The works of Myron are especially noted for their excellent representations of the human form in action, the well-known Discobolus being a typical example.



Owing chiefly to the universality of his genius, Phidias was deemed the mightiest of the many great sculptors of his time; and although his greatest triumph, the colossal statue of Zeus, wrought in ivory and gold, and placed in the Temple of Olympia in Elis, did not adorn the Acropolis at Athens, yet he was there represented by a large number of beautiful works. In fact, in most of the undertakings entered upon by Pericles with the view of enhancing the beauty and glory of his native city, the creative genius, if not the actual hand of Phidias, was ever active.

Although Athens excelled the other Greek states in the number and splendour of her artistic treasures, the progress and development of Hellenic art was not confined within the limits of the city. On the contrary, many of the states of Greece possessed examples of architecture and sculpture of very great excellence, such as, to give a single example, the celebrated Venus of the Louvre, which came from Melos. As a matter of fact, Greek artists were accustomed to work for any state that would employ them, and thus the Greek temples, more especially those that were the seats of Oracles, were often filled with the works of the greatest artists of the time, which were presented by devout worshippers.

It has been well said that constant association with noble thoughts and beautiful sights has the same effect upon the mind as residence in a healthy place and daily athletic exercises have upon the body, and there can be little doubt that great artistic and literary triumphs of the Greeks brought an intellectual distinction that was almost unique to the supremacy of Athens, although the pre-eminence of that city had originally been secured almost entirely by the strength of her naval power and the martial activity and patriotism of her citizens.

GROUND FLOOR PLAN

SECOND FLOOR PLAN

THE HOLBORN NEW TOWN HALL: PLANS. WARWICK & HALL, ARCHITECTS.

LATER LESSONS FROM VIENNA.

"A Splendidly Planned City."

At the opening of the sixty-first session of the Liverpool Architectural Society, recently, the newly elected president, Mr. T. E. Eccles, F.R.I.B.A., said that in considering the subject of his address, he thought he could not do better than give his impressions of the Congress at Vienna, which was held last spring, and at which he was present. The Congress was attended by leading men from the different nationalities to the number of 1,400, and the opening ceremony was held in the Chamber of Deputies in the Houses of Parliament. By some misunderstanding, England, Mr. Eccles regretted to say, was not represented among the principal delegates on the platform. M. Harmand drew attention to an important point of which he was astonished to find Englishmen—diplomatists as well as architects—were unaware, namely, "That the English laws of 1766 and 1862 conferred complete protection on the architect's work."

International Competitions.

The much-vexed question of International competitions was discussed, as well as such subjects as architectural copyright and the ownership of drawings, legal qualification and Government certification of architects, the protection of ancient monuments, and what steps can be taken to secure a greater regard for æsthetic construction in engineering works.

A "Baroque" Boom?

Of course the visitors' time was principally taken up with viewing the buildings and the city. One naturally is struck by the symmetrical lay-out of the city, and the means of access to the different parts from the principal thoroughfare, the Ringstrasse. Mr. Eccles was sure that he was not the only one who was immensely impressed by the beauty of the buildings in Vienna erected in the early part of the eighteenth century in the style known as Baroque, and he felt perfectly confident that after this visit of architects of the various nationalities, this style will have a very strong influence on future design. He referred especially to the Rathaus and the Palais Kinsky. Of characteristic buildings, Mr. Eccles said, his hearers had doubtless seen illustrations by Mr. Rickards in THE BUILDERS' JOURNAL. Also of this date are fine examples in the Singerstrasse. The gates leading to the Belvidere Palace, 1715-1725, were illustrated in THE BUILDERS' JOURNAL of June 24th. Of the Gothic period of the fourteenth and fifteenth centuries, the finest examples, Mr. Eccles thought, were the Cathedral Church of St. Stephen and the smaller one of our Lady on the Shore. The latter to him appeared a perfect gem, and full of good things.

Liverpool to Vie with Vienna.

Vienna is a splendidly planned city, and the municipality has under consideration further improvements in the laying-out of the streets and suburbs. This naturally leads one to hope for great things in the future development of our own cities from that admirable Bill which he hoped would become law next session, the "Town Planning Bill." Referring to the Liverpool Town Planning Bill, Mr. Eccles suggested that the idea of the Ringstrasse is being adapted to the requirements of Liverpool under very difficult circumstances. He thought it was hardly sufficiently recognised that Liverpool Corporation intend to make Liverpool a city second to none in this country, under this new Act which he hoped would soon become law. Of course the development of the old part of Liverpool is a matter of time and circumstance, but the Corporation are dealing with the New Liverpool outside this with no uncertain hand.

Rise of the "Ring" System.

One is bound to recognise, Mr. Eccles declared, the superior laying-out of cities like Vienna, Munich, Cologne, Frankfort, etc. How are they able in these foreign cities to deal with existing poor conditions and improve them? The following description will explain the method:—The earliest of the important European cities to adopt the "Ring" as a means of connecting the radial thoroughfares was Vienna; and in 1857, as a result of considerable popular agitation, the Emperor Francis Joseph issued a decree addressed to the Minister of the Interior requiring that "the enlargement of the Inner City of Vienna for the purpose of its suitable connection with the suburbs should be undertaken as speedily as possible."

The improvements dealt rather with the enlargement of the inner city, and with its connection with the suburbs, than with a remodelling of the district itself, which was then mainly occupied with the fortification and ditch and a wide space beyond. The fortification and ditch still surrounded the heart of the city, though the buildings had long grown beyond, and it was suggested that these should be removed, and at the same time adequate provision be made for a new opera-house, museums and galleries, and other of the more important public buildings. It was decided to open a competition of plans for the improvement, the jury to consist of a commission of officials who represented various interests. Before the final award was made, the plans had to be further submitted to a committee of specialists. Three prizes, of 2,000, 1,000, and 500 gold ducats, were to be awarded to the successful competitors. Eighty-five designs were submitted, and, though none of the premiated plans was literally carried out, many valuable suggestions were adopted, and set the standard for the final scheme. Encouraged by the success of the competition, the Municipality again inaugurated, in 1892, a competition for the remodelling of old Central Vienna, and invited architects and engineers from all parts of the world to submit plans. Profiting by their former experience, they did not hope to find amongst the competitors any one suitable complete design, and they therefore divided their prizes, giving two of 10,000 florins, three of 5,000 florins, and three of 3,000 florins. For "part designs which do not comprise the whole city, but consider only a few questions of the improvement, or means of communication," there were prizes of 3,000 florins and under; and, finally, prizes were awarded for plans that were good in parts, though not satisfactory as a whole. The jury was composed mainly of professors, and leading architects and engineers.

Architectural Advisors on Town Planning.

It appeared to the author that, broadly speaking, it would be of great value to our various large cities if the architectural advisors of the councils were permitted to see on the spot what was already done or was in contemplation in such cities as Vienna, and to enquire into the methods adopted by means of architectural competition to obtain the best schemes, even though these schemes took years to develop.

THE ARCHITECT AND THE STRUCTURAL ENGINEER.

(Contributed.)

Some remarks by Mr. W. Noble Twelvetrees, contained in his recent presidential address to the Civil and Mechanical Engineers' Society, suggest the danger, to architecture no less than to the architectural practitioner, which appears to be contingent on the steady growth of structural engineering. The society in question has long offered the privilege of membership to architects, because it has been recognised that they are often deeply interested in the solution of engineering problems, and that in their work there occasionally arise problems that demand a certain amount of engineering knowledge. Dealing appreciatively with the policy pursued in this direction by the Society, Mr. Twevetrees nevertheless stated it to be his opinion that, despite the encouragement given to the investigation of constructional science by the Royal Institute of British Architects, it would be found that in the erection of modern buildings the knowledge of architects would not carry them far enough, and they would have to invoke the aid of the engineer. There are doubtless instances, particularly in the erection of very large buildings in which the lighting, heating, or ventilation is a science in itself, where the assistance of the engineer is welcomed. But when we come to the question of the main construction of buildings, it cannot be too forcibly contended that this is as much the architect's work as is the actual designing of the plans or elevations. It must unfortunately be admitted that there are architects who, as regards their steelwork, put their trust in the small army of specialist draughtsmen and designers employed by each of the big steel manufacturing firms. But those architects who do not place too much reliance on extraneous aids of this description, who not only perforce accept, but also actually by their knowledge and experience are competent to undertake full responsibility for all constructional work, perform better service both to architecture and to their own profession. The fast increasing use of steel as the constructional skeleton in most commercial buildings, the rapid growth of the use of reinforced concrete, together with the strong probability that construction in steel and reinforced concrete will be by law allowed in the case of at least all London buildings before the expiration of twelve months—all such signs of the times render the determination of the architect's position with regard to what is usually termed structural engineering to be a matter of vital importance.

The derogation by architects of any responsibility for structural design might conceivably have a seriously adverse effect on the vital strength and vigour of modern architecture. An analysis of an architectural design may be concentrated on three points—first the plan, then the

Photo: *C. Ellis.*

THE HOLBORN NEW TOWN HALL: THE COUNCIL CHAMBER. WARWICK & HALL, ARCHITECTS.

construction, and thirdly the æsthetic element which has effect in influencing, colouring, and transfiguring the two former. An architect in preparing a design has these three factors ever in his mind, no single one can usually be thought of except in conjunction with one or other of the remaining two. Everyone knows, for instance, how in the great historic styles of architecture the construction has formed the solid basis of design. Therefore, if by any unfortunate combination of circumstances responsibility for construction, and with it the possibilities of structural design in the highest sense of the word, becomes even temporarily to be lost to architects, the result can be nothing less than a calamity. Bereft of one of his three incentives and aids to high achievement, the architect would be prone to produce but a feeble and halting architecture.

It may, however, be suggested that an architect and an engineer can be so closely in touch with one another as to work together towards a satisfactory constructional and artistic result. This presupposes the existence of singleness of aim rarely met with in men of entirely different training and ideals. In fact, if an engineer becomes so attuned to the influence of the vital forces which go to make architecture, he will *a fortiori* be reasonably entitled to be considered an architect. There is, however, nothing in the theories and practice of structural design which is beyond the attainment of an architectural student, and it is for the younger members of the profession to awake to a realisation of this fact. The prospects of the profession are not likely to improve materially if any self-complacent inertia in the rising generation of architects tends to admit of serious inroads in the rightful province of architecture being effected by the structural engineer.

Proposed Extension of the District Railway.—The rural district between Wimbledon and Sutton at present suffers from the want of travelling facilities to Waterloo, the Thames Valley, and the Metropolitan District Railway system via Putney and Earl's Court, and a number of land and property owners have framed a scheme for the extension of the Wimbledon and Putney line of the Metropolitan District Railway from the former place to Sutton. In order to further the project, a meeting has been held to discuss the *pros* and *cons* of the proposal. The scheme, as at present outlined, is to extend the line from the Wimbledon terminus through South Wimbledon, to a point about midway between the Wimbledon and Raynes Park Stations, and to carry it to Merton Park (a rapidly growing district to the south-west), thence to Morden and Sutton. The Wimbledon and Putney line has succeeded remarkably in developing the land through which it passes, and there is now a service of something like 100 trains each way per day. It is thought that a like success would follow the construction of an extension to Sutton, and the fact that the Wimbledon and Putney line was promoted and the Act obtained by the landowners is an encouragement to the present promoters.

Bury.—Lord Shuttleworth has opened a new operating theatre and other extensions to the infirmary, which have cost about £4,500.

THE ARCHITECTURAL PROFESSION OF TO-DAY.—VII.

Having met, and successfully overcome, the difficulties presented by the preliminary examination, the Probationer's admission to the second, or Intermediate, examination (presuming he has attained the age of 19 years) will depend upon his satisfactory execution of various Testimonials of Study, consisting of illustrations of old examples measured, if possible, from actual buildings. We think the recommendation of the Board of Examiners to the effect that the orders should be thus measured and delineated ought to be so worded as to leave no shadow of doubt in the mind of the probationer that these splendid legacies of the art of bygone ages must be studied *exclusively* from correct examples; because even as ungrammatical writings are, or should be, withheld from the student of literature, so the unscholarly equivalents in brick or stone, which are, alas! beloved by so many modern architects, ought not to be allowed to exercise their baneful influence upon the embryonic practitioner. The examination itself embraces the following subjects, viz., (1) Classic Ornament; (2) the Characteristic Mouldings and Ornaments of each Period of English Architecture, from A.D. 1000 to 1550, with their Application; (3) the Orders of Greek and Roman Architecture, their Origin, Development, and Application; (4) Outlines of the History of Mediæval and Renaissance Architecture in Europe; (5) Theoretical Construction; (6) Descriptive Geometry; and (7) Elementary Applied Construction. Students who have attended the two years' course at King's College, London, or other similar courses at University College, Liverpool, and elsewhere, may be exempted, under certain specified conditions, from sitting for the Intermediate Examination, provided the work done by them during the session is submitted to and approved by the Board of Examiners as suitable Testimonials of Study.

Stress is also rightly laid upon a recommendation of the Board of Architectural Education that students, within reach of certain universities and schools at which the study of architecture may be pursued, should "avail themselves of the opportunities these institutions afford, and take up the architectural courses provided rather than submit themselves for the examination without such recognised training." Whilst the details of this examination are, generally, well thought out, yet surely something of a more up-to-date nature and useful character could be substituted for the drawings of the "framed timber floors," set as the subject of Sheet 8 in the Testimonies of Study? Our main objection to this scheme of examination arises from the fact that, having regard to the limited period of preparation allotted to the student, *it attempts far too much*. We do not doubt that many students can and do emerge with success from their encounter with this examination after only two years of preparatory study. But we are certain that, within this limited period of time, no student can hope to obtain a *thoroughly sound and reliable knowledge of the whole of the seven subjects of which the examination consists*. A re-arrangement of the scheme of study is, therefore, absolutely necessary to ensure the success of any effort that may be made to enable the student of architecture to become thoroughly conversant with the technical essentials of his profession, which are, in a large measure, embodied in this examination. In our judgment, the Intermediate Examination should be divided into four parts, the subject matter of each part being of such a far-reaching and comprehensive character as to necessitate a year's preparation, involving sessional work at an architectural school, in addition to the pupil's attendance at the office of his principal.

During his four years of preparatory study, the work executed by the probationer at the studio of the architectural school, under the supervision of a practical and experienced architect, should be regarded as being of far greater value, as evidence of his efficiency, than any work of a like nature produced under the stress of written examinations. As to the Final Examination—which at present enables a student of 21 years of age to qualify for candidature as an associate member of the Royal Institute of British Architects—we would not allow any young architect to present himself for it who had not attained the age of at least 25 years. The Testimonies of Study required for this examination comprise the following drawings, viz.:—(1) A study of Ornament from the round; (2) A design for a Building of moderate size; (3) Measured drawings of some Historical Building, or part of a Building; (4) One sheet of diagrams of constructive Masonry or Brickwork; (5) One sheet of diagrams of a Roof Truss of iron or steel of not less than 40ft. span.

Now, to enable them to carry irrefutable proof that the whole of the above drawings are "Testimonies of Study" within the *real* meaning of the term, it is absolutely necessary that each of the above scheduled drawings should be prepared, from start to finish, in the studio of an architectural school. A certificate "signed by a member of the R.I.B.A. or other person of recognised position," to the effect that the student is a proper person to be admitted to this examination, and that the Testimonies of Study he submits are his own work—which is all that is now required—is certainly *not* sufficiently conclusive evidence that the student has intelligently analysed and studied the subjects he has delineated.

The Final Examination itself—to qualify for candidature as Associate of the Royal Institute of British Architects, and to be passed by students whose Testimonies of Study have been approved—is arranged in two parts. In Division I., the candidate is examined in design, and, in Division II., in the following subjects, viz.:—

(a) The Principal Styles of Architecture—their Features, Mouldings, and Ornament.

(b) The Nature and Properties of Building Materials.

(c) The Arrangement and Construction of Buildings in relation to Health.

(d) Specifications and Estimating, and Construction.

Apart from the architectural schools, proper instruction of a more or less elementary kind can be obtained by the student at many of the now numerous Polytechnics, Schools of Arts and Crafts and Technical Institutes, but we doubt whether the educational methods

employed at these establishments are of the best possible kind. Indeed, to us, the curricula of study appear, too often, to be framed with the object of affording the student facilities whereby he may be enabled to pass the statutory examinations of the Royal Institute of British Architects, rather than with any idea of instructing him in the art of architecture.

The system of pupilage, in alliance with the system of communal study, is, theoretically, a perfectly sound one, provided the practical experience only to be acquired in an architect's office is *properly* supplemented by a course of sound and efficient training in the studio of the school. Yet, although training of the requisite kind is only to be obtained through the medium of men who are essentially scholarly architects, nevertheless it is indisputable that the general tendency of the day is to relegate architectural education to imperfectly trained teachers, "cranks," or professional "crammers."

The difficult problem of the education of the architect is as yet unsolved, and it may be confidently expected to remain so until the unity of the profession is an accomplished fact. Meantime, architectural students, who are capable of qualifying as practising architects under the present defective system of education, and through the fallacious tests so long imposed by the R.I.B.A. under its scheme of examinations, will continue to flock into the profession. Architects who complain of the shortage of work, of the admission to the profession of undesirable men, and of the unfair competition which is thus brought about, must remember that the remedy, to a large extent, lies in their own hands. In brief, they must cease to make the pathway to the profession *too* smooth for the undesirable and imperfectly educated man. To satisfactorily effect this object the united efforts of the whole profession will be required. We have already alluded to the vital necessity of placing the education of the young architect in the hands of those properly qualified to lead him to realise the full significance of his art—to teach him to sift the architectural wheat from its chaff—to enable him to realise that the possession of genius without scholarship is useless, and thus early lead him to discriminate between what is good and what is bad in modern work. We now suggest that any reorganisation of the teaching element should be accompanied by drastic reforms in the *personnel* of the administrative boards which have been instituted for the conduct of architectural education and architectural examinations. In our opinion, sufficient care has not, hitherto, been exercised to prevent the unpractical "faddist," the surveyor, and the unscholarly architect, from being far too much *in evidence* on those Boards or committees which have been formed for the purpose of initiating and administering schemes framed to solve perhaps the most difficult of the many problems now awaiting solution by the architectural profession. A central controlling authority—truly representative of the views of the entire profession—might be expected to deal satisfactorily with this burning question of education and examinations; but its *personnel* would have to be selected with the greatest care and judgment.

ARCHITECTS AND PUBLIC BODIES.

The Week's Complaints.

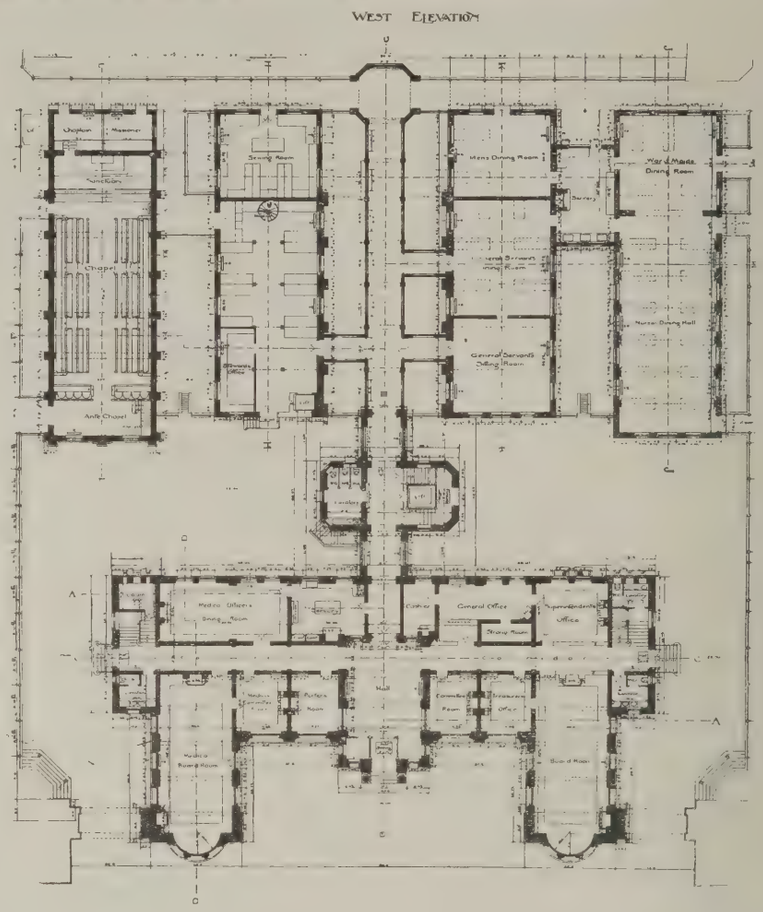
The latest competition which has been unfavourably reported to us is that for the Cornwall County Offices. In our issue of September 30th, we reproduced some comments of a Cornish architect, which had been sent to our contemporary the "Western Morning News"; but these, while unfavourable, took the form of generalities on the subject of competitions rather than specific complaints concerning this particular competition. We have since, however, received a letter from a well-known London architect, in which he states:—"I have written asking if, on return of conditions herein—supposing I find them unsatisfactory—my £1 1s. will be refunded. The reply of the Clerk is in the negative. . . . From the correspondence I have had with these authorities, I gather the contemplated assessor has not been asked to prepare or advise on the conditions." Now, these are serious points, and those who contemplate entering for this competition, or who have already entered for it, may well be urged to stay their course. The Ilford Hospital Competition, upon which we commented last week, is an instance of the unsatisfactory results that are almost bound to eventuate when the conditions have not been drawn up by a proper assessor. The temper which characterises the Cornwall County Council in its dealings with architects may well be gauged by its procedure in the matter of deposits, mentioned above. In the light of the experiences given, we have starred the competition, and if architects choose still to participate, they have only themselves to blame if the result is disappointing, and their labours are wasted. While on the subject of competitions, we may draw attention to that promoted by the Whitley and Monkseaton Urban District Council, which appears in our list this week for the first time, and is already starred. The Council want designs for a public shelter to provide seating accommodation for 1,000 people and promenade space for another 400; and they offer a premium of £20 to any architect who will show them how to get it for £1,200, or less. We do not think that that £20 will be money thrown away. The successful architect—if such can be found—can figure out how much marble, mosaic, statuary, and bronze can be thrown in to bring up the cost to the stupendous sum allowed. The Council, however, does not bind itself to erect the shelter; but if the work is proceeded with, the successful designer will get the "usual architect's remuneration"—not the architect's usual remuneration, mark you!—less, of course, the £20 already paid as a premium. The merging of the premium is now so usual that most architects regard it without any misgiving. We do not; and we take leave to point how it operates in an instance like the present. This beneficent body asks architects to get to work and supply them with designs for a shelter. They offer one premium of £20—which merges. So that no one gets anything for his trouble, except the successful designer, and he gets just the ordinary fees—if the design is carried out. So now let the designs roll in to this Council, who, "*with such advice as they may decide to obtain*," will be the sole arbiters in the matter. Think, gentlemen, on what a high plane your dignified and honourable profession rests in the eyes of the worthy Councillors of the Whitley and Monkseaton Urban District. Prostrate yourselves, and with deep obeisance, offer them grateful thanks that they do not demand £5 5s. deposit for the conditions and particulars.

The promotion of competitions is not, however, the only work at which our public bodies shine. There is the case of Mr. Charles Cole, an Exeter architect, who has, at considerable cost to himself, revealed the happy legal position of public bodies in regard to payment of their debts. Mr. Cole did a lot of work for the Topsham Parish Council; he charged them a very low fee, amounting to £16 7s. 1d. Then the Council discovered that they had not sealed his instructions, and so they need not pay his bill. And they did not pay it. It, moreover, turned out that they had no right to give him instructions to design roads for them at all, the construction of roads being beyond their powers. The County Court judge could only regret his inability to give judgment against the Council, and Mr. Cole has everyone's sympathy—but no fees.

The architects of Harrogate are aggrieved with their Town Council. The latter has two big works on hand, the extension of the baths, and the building of a new infants' school at Bilton. The first-named, costing £14,000, is being carried out by the Borough Surveyor; the Education Committee recommended a like procedure in the case of the second. Then the Harrogate Architectural Society protested strongly, and pointed out that all previous school work had been done by architects. Alderman Houfe stood out as a worthy supporter of an oppressed profession; but the interests of the ratepayers was strongly urged, and, on the casting vote of the Mayor, it was decided that the school should be designed by the Surveyor. So Messieurs the Architects of Harrogate will not have an opportunity of increasing the general district rate. But they may have their revenge. They can retire to the workhouse, and send the poor-rate up with a run.

We shall return to this subject from time to time, as occasion demands.

We are asked to state that Messrs. H. Johnson and Sons, plasterers, of Liverpool, have a London office and studio at 1-5, Little Denmark Street, Charing Cross Road, with centrally situated workshops in New Compton Street. They have also secured fine showrooms in the west central district, which will shortly be opened. The London works are under the actual personal supervision of one of the principals of the firm.



* * *

Cheltenham.—Salterley Grange Sanatorium, which has been erected for the Corporation of Birmingham on the Cotswold Hills, near Cheltenham, and was formally opened on October 15th, provides accommodation for forty patients in four blocks of châlets, which have been built in local brick, faced with rough-cast stucco. The work has been designed and carried out under the superintendence of Messrs. W. H. Ward, of Birmingham.

THE MANCHESTER NEW ROYAL INFIRMARY.

During the past week the new home of the Manchester Royal Infirmary has been open for inspection by the public. Full advantage has been taken of this privilege by many architects in Lancashire, who have thus undoubtedly gathered valuable professional information, as this important building embodies all that scientific knowledge and medical skill can suggest for the proper treatment of the injured and diseased. Within the last quarter of a century, the pressure upon the infirmary has enormously increased, and has been due partly to the growth of population and partly to the remarkable development of modern methods in medicine and surgery. No progress was made towards the erection of the new hospital till 1902, owing to an acute controversy as to whether the demand for extra accommodation could be more efficiently met by rebuilding on the old site, or by a new building on a new site. Finally, after the election of a new board of management, the presentation of a suitable site was made by the Trustees of the late Sir Joseph Whitworth to the University of Manchester for hospital purposes, to which additions were made by purchase, increasing the site to nearly 13 acres in area.

A limited competition was held, and confined to certain architects conversant with this class of work, Mr. J. J. Burnet, A.R.S.A., F.R.I.B.A., acting as architectural assessor. He recommended for acceptance the plans submitted by Mr. Edwin T. Hall, Vice-President, R.I.B.A., and Mr. John Brooke, F.R.I.B.A. With some modification of detail, the new infirmary is the realisation of these plans. Provision has been made for 592 patients and 339 resident

MANCHESTER NEW ROYAL INFIRMARY.
GROUND PLAN OF THE ADMINISTRATION BLOCK.

BLOCK PLAN

MANCHESTER NEW ROYAL INFIRMARY.

officers, nurses, and servants, occupying 48 separate blocks, at a cost of about half a million pounds. The major portion of this sum has been paid by the Manchester Corporation for the old site in Piccadilly; public and private benevolence have also assisted the board of management to almost raise the desired amount. In addition to the cost of the infirmary itself, there will be later an expenditure, estimated at £25,000, for the erection of a branch in the centre of the city for the treatment of slight accident cases and other ailments of a minor character.

The general disposition of the buildings will be readily understood with the assistance of the published plans. The main frontage to Oxford Road shows an imposing building, irregular in outline, with busy features, and a straining after a broken skyline which does not help the architecture, though partly due to the planning of the hospital. Owing to the position allotted to the west entrance lodge, no one is able to see the main approach properly. All the blocks are connected by covered ways, and they are so arranged that, whilst the distances separating them are comparatively small, plenty of fresh air is provided. All the internal traffic of the hospital is under cover. The sides are enclosed only to a height of four feet, so that whilst the ways are fully protected by the sides and overhanging glass roofs from the inclemencies of the weather, the air has free access, and satisfies the stringent requirements of modern practice as to free air space throughout each

General view of the principal front.

Photos: Entwistle, Thorp & Co.

THE MANCHESTER NEW ROYAL INFIRMARY. EDWIN T. HALL, VICE-PRESIDENT R.I.B.A., AND JOHN BROOKE, F.R.I.B.A., ARCHITECTS.

part of the hospital. Under the covered ways are subways in which all the principal heating, hot water, steam, gas, and cold water pipes are laid, as well as electric mains and telephone wires, enabling the mechanical staff to attend to them without interfering with the regular traffic of the institution.

The wards are built on the pavilion system, with spaces of 60ft. between. Of the ten pavilions, six are allocated to surgical cases and four to medical cases; five pavilions have three storeys, and the other five two storeys, thus providing in all 25 large wards. They all lie at right angles to and are entered from the covered ways already referred to. This arrangement, dictated by the shape of the land, has many important advantages. It enables every pavilion to have its axis north and south, so that every large ward with windows on three sides receives direct sunlight, and the distance from the administrative centres of distribution is reduced to a minimum, effecting a great saving in time and labour. Also, the subdivision of internal traffic for goods and staff reduces noise and confusion. The distance from the main thoroughfares and the intervening buildings minimises external noise.

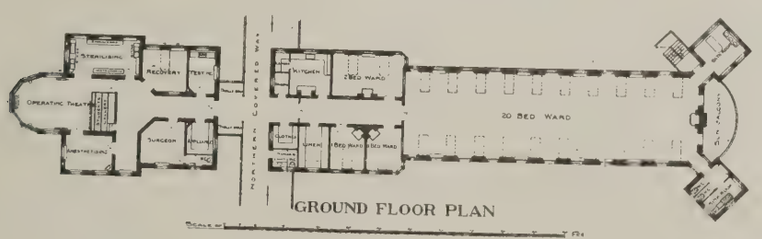
Each pavilion has an open paved basement by which aerial separation from the ground is secured. In the basement are the branch mains for hot and cold water, gas, etc., taken from the main subway, vertical pipes ascend, and all horizontal pipes which collect dirt are avoided in the wards.

In the administration block, particularly, and throughout this institution the position allotted to the staircases has been carefully considered, so as to secure suitable division and safety in case of fire. All the staircases extend to the flat roofs, which are available for promenade purposes. Each bedroom in the Nurses' Home has an inlet ventilator and an outlet ventilating shaft connecting directly with a main airway in the roof, from which an electric fan draws the air, creating a ventilating current out of each room. The windows of the upper storeys are all arranged so that the glass can be cleaned on the outside from the inside of the rooms.

The sanitary conveniences in the detached towers have various novelties in the details worth examination. The bath and the twin-filter in the ward kitchen received medals at the Cardiff Sanitary Exhibition before being in actual use. The wards are heated by hot-water radiators, arranged in cast-iron casings; a supply of fresh air, regulated by a valve, enters at the back, is warmed on the hot surface of the radiator, and passes into the room through hit-and miss plate valves. To facilitate cleaning, the front of the radiator casing is hinged, and the radiator itself hung on pivots, so that access is obtained to every part of the radiator and air passages. The originality of the swinging hot-water radiator and the question of the constant wear and tear on the bearings, owing to the weight of metal and water, are matters that are being watched with great interest by heating firms and architects. All the windows have fanlights at the top, with side draught protectors. The glass in some of the lower windows is of a new kind designed and made specially; it is obscured without detriment to its transparency or the smoothness of either surface, and is used on the sides where the male and female wards face each other. Liberal cubic space is allowed to each bed. The floors are covered with linoleum laid on the smooth concrete; and the low skirtings of teak hollowed out to an easy curve. The walls and ceilings are painted and varnished, and join a curve; there is not a single square corner in the ward where dirt can be harboured. The "Gilmour" doors, except those with glass panels, are absolutely flat and smooth on both sides; made of polished wainscot oak, they are handsome in appearance and perfect hygienically. In short, no pains or expense have been spared to give the patients that absolute cleanliness of environment which is the prime demand of modern hospital practice.

In the operating theatre the most noticeable feature is a small gallery to accommodate some 24 students, which is shut off from the operating part of the theatre by a plate glass screen 7ft. high, designed to intercept dust, but not to cut off a clear view or the sound of the surgeon's voice; a separate door connects this gallery directly with the lobby. The theatre walls are lined with Sicilian marble to a height of 7ft., and above, with "re-constructed marble," whilst the ceilings are glazed with opalite. The floor is of terrazzo. The surgical and sterilising appliances are kept in an annexe communicating with the theatre through an open archway.

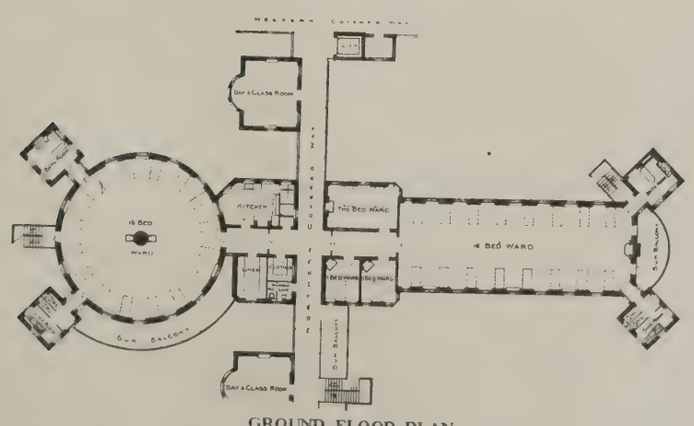
The grounds surrounding the wards have been made as green as possible with grass, and many of the trees which had grown in the gardens occupying the site have been retained. Iron staircases between each pair of pavilions give access to the grounds.



The drainage scheme is divided into many sections, each one thoroughly ventilated, so that there are no pipes in which sewer gas can accumulate. Every group of rainwater drains is carried to a flushing tank placed near a manhole, so that the soil drains are kept constantly flushed without the cost of using town water. Every manhole was specially designed, and is of glazed ware, the bottom is in one solid piece, with all branch inlets at the required angles. Every drain can be swept throughout its length. All rain manholes are covered with open gratings.

The cold water service throughout is direct from the mains to baths, sinks, and closets, but as a breakdown in the supply would be a very serious thing, the service is taken from three separate Corporation mains, any one of which can serve any part of the hospital.

The electric supply is, for the same reason, taken from separate Corporation generating stations to the main switchboards. In each pavilion the light is divided between the two separate sources of supply, so guarding against total failure. In the operating theatre there is also a low tension supply from a storage battery, and in other important spots pilot gas light.



In the W.C.'s the closets throughout, supplied by Doulton and Co., Ltd., have the flushing tank, of white glazed stoneware, like the basin, fixed immediately above the basin. The flush is automatic, actuated by the door without rod gear, and so worked that no flush occurs on entering the water-closet and shutting the door, but only on leaving, thus effecting a saving of 50 per cent. of water, as compared with the usual door flushes. All closets are supported directly from the walls, leaving the floor

MANCHESTER NEW ROYAL INFIRMARY: THE WEST ENTRANCE LODGE AND ADMINISTRATION BLOCK BEYOND.

free from obstruction to thorough cleaning.

The baths, also by Doulton's, are of white glazed ware, have parallel sides, with ante-splash rim made flat, and Doulton's patent mixing valves. They are so wide that a bather can sit in them with comfort.

The filters, which are fitted over the sinks, are "twins" joined together by an arch and bib-valve, on which a thermometer is fixed. Hot and cold water are laid on, and thus filtered water at any temperature may be obtained. The filtering china "candle" is also protected by a stocking which collects all dirt, and is readily removable for cleansing.

A destructor furnace and steam disinfector are located near the boilers. All the clocks are electrically controlled from a high-class master clock. The locks, door and window furniture, floor springs, and fanlight gearing have been supplied by Messrs. Colledge and Bridgen, Wolverhampton.

The foregoing description of the modern arrangements and details throughout the building will be of practical service to those interested in infirmary building for future reference.

Among the other sub-contractors who may be mentioned, are the Farnley Iron Co., and Burmantofts, who supplied the glazed bricks; the British Doloment Co., Ltd., who supplied the flooring of the small wards; the St. Pancras Iron Works Co., London, who furnished the pavement lights; Dargue, Griffiths and Co., who carried out the heating and hot water plants, piping, steam mains, etc.; James Slater and Co., Ltd., who executed the kitchen plant; the Palatine Engineering Co., who supplied the Kelvin taps; and George Wragge, Ltd., who made the iron casements; Davidson and Co., Ltd., supplied the electric fans; Veritys, Ltd., electric light fittings; other electric light fittings coming from the General Electric Co., Ltd.; and the oak doors were made by the Gilmour Door Co., Ltd.; Peace and Norquoy made the folding partitions; J. W. Singer and Sons, Ltd., the bronze panels; and Richard Crittall and Co. supplied the gas, hot closets. Furniture and furnishings were supplied by Goodalls, Lamb, and Heighway, Ltd.; steam and electric sterilizers by James Slater and Co., Ltd.; and special fire appliances by Minimax, Ltd. Harold Arnold and Son, of Doncaster, were the general contractors, and Alfred Turner the chief clerk of the works.

London, E.C.—The memorial stone for the new rating office for the City of London was laid on the site of the old Council Chamber of the Guildhall. The old building, which was erected about 1777, consisted merely of the chamber and a vault below, while the building now in course of construction will have a basement and four storeys. On the first floor is to be erected a court to be used by the licensing justices and the Recorder. The cost is estimated at £12,865.

* * *

Messrs. H. C. Cleaver, Ltd., 35, Berners Street, W., and Tudor Works, Park Royal, N.W., whose exhibits at the Franco-British Exhibition have attracted much attention, have been awarded the silver medal for furniture shown in class 69, and a diploma of honour for their "Tudoresk" wall panelling and fitments, shown in class 66.

The proposal to build a huge casino along the foreshore at Brighton was strongly opposed at an influential public meeting that was held at the Bedford Hotel, Brighton, with Sir Henry Kimber, M.P., in the chair. Persons representing various interests protested against the scheme, and a resolution was passed condemning it. It is now a question whether, in face of such opposition, this ambitious scheme will ever materialise.

* * *

The firm of Wailes, Dove, and Co., Ltd., who exhibit at the Franco-British Exhibition in the Palace of Machinery, Stand No. 337, their patent "Bitumastic" enamels as applied to the ships of the British and foreign Admiralties, the mercantile marine throughout the world, and to the plant of the chief industrial concerns, railways, and municipal corporations in the United Kingdom, have been awarded two diplomas of the highest merit, with gold medals in classes referring to the mercantile marine and civil engineering respectively. This firm also received gold medals at Genoa, 1905, Milan, 1906, Savona, 1906, and Bordeaux, 1907, for superiority of the anti-corrosive qualities of their patent "Bitumastic" enamels, etc.

* * *

Mr. Arthur Race has been appointed to the position of borough engineer and surveyor of the county borough of Barrow-in-Furness in succession to Mr. W. Smith, who has gone to Edinburgh. Mr. Race has been the assistant engineer and surveyor at Barrow since 1901, when he was selected for the post out of 120 applicants, so that the present appointment is a preferment in the same office.

Correspondence.

Ideal Homes.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I, and I am sure others of our weird profession, look forward to your criticisms upon the three successful designs for cottages costing £1,000, £750, and £500 each. I hope you will not miss this opportunity of judging for yourself what is the "Art of Architecture." I am concerned as to what the public must think of us as a profession. We cannot expect the public to think much of us as artists, or even as common-sense business men. Imagine any member of the public (or even an architect) approaching the £1,000 house and calling it a cottage home. The £750 cottage is even more ludicrous than the former cottage. It is a crofter's cottage, such as you see in Wales, and the design, as delineated, appears "done for fun"; such draughtsman's work would certainly incite students to slovenly work. The £500 cottage seems better all-round. The competition, I understand, was to give the public an idea of what a cottage home should be; it was to illustrate "the ideal home," and the chief merit in the designs was to be "art of architecture" consistent with good planning, comfort, and, I suppose, commonsense. I hope I have been deceived as to what an "ideal home" is, or should be, and I further hope, Mr. Editor, you will give us in your next issue of THE BUILDERS' JOURNAL your candid opinion of the subject matter and the three designs placed first by the assessor, who, by the way, I think most architects consider the first in the land to tackle domestic architecture in the "art of architecture" manner, and from a common-sense point. Being a competitor in the above, and not one of the successful ones, it is natural that I should complain.

"A COMPETITOR."

[Our correspondent will have seen our notice of these. The assessor selected the three designs no doubt as the best of a very poor lot. When our correspondent praises the £500 cottage, has he studied the sections? The slope of the roof-wall begins about 20in. above the floor line, so that the habitable area of the bedrooms is far less than the figured floor area. It might be an ideal recreation for people to crawl about the floors of their bedrooms; but personally we prefer to be able to stand upright.—ED. "B.J."]

The Architectural Profession To-day.

To the Editor of THE BUILDERS' JOURNAL

SIR,—Unemployment at the present time amongst architects, surveyors, and their assistants has been attributed by your correspondents to various causes. There are also other reasons why the profession is not prospering at the present time—for instance, the employment of city and urban surveyors to design and superintend the erection of public buildings, for whose salaries local architects contribute to the rates.

In the district in which I practice, the surveyor's assistant (who is also paid a good salary out of the rates) undertakes the preparing of plans for speculative builders and the general public. Are not public officials employed on the undertaking that they give their whole time to their duties?

I also find that when architects are employed to prepare their plans, their clients have an idea that as the Council's surveyor will inspect the work they can therefore dispense with the architect. The Council's surveyor inspects the work about three times.

How can a surveyor, or surveyor's assistant, conscientiously inspect the work of his client for his Council without very often upsetting his client? Should he report the work as not in accordance with the by-laws, his client would naturally turn upon him, and perhaps not pay him his fees for preparing the plans.

The above, I think, are some very good reasons for the present unemployment, which I think the Registration Bill would remedy.

ONE OF THOSE AFFECTED.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—May I be permitted to mention one or two matters of general interest upon which I (and I am sure many others) would be glad of some advice? In sending plans away in answer to advertisements or in competitions, etc., there is little doubt that the plans are in some cases made use of. The long time they are kept and the condition in which they are returned go to prove it. An unscrupulous person might make a very good thing out of it. Some sort of protection seems to be necessary here. Again, with regard to the custom (as it appears to be) of making out-of-work assistants pay the expenses of interviews with a possible employer, when they have been requested by the employer to take the journey, which as often as not is a long one, is distinctly hard on the assistants. Once more, sometimes an assistant gets an offer of work in an office which has just opened. He does not know anything about his prospective principals or even what the work is. How can he engage rooms at his own risk, if he happens, as is probable, not to be living near? How can the assistant be sure of receiving his salary? What is the best way to deal with these difficulties? Perhaps some of your readers will tell us what they have done to provide against being thus plundered.—Yours faithfully,

A REGULAR READER.

Biggleswade.

Cleaning Old Stone Buildings: Is It Harmful?

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I have been asked to advise on the best means of cleaning down an exceedingly grimy stone-faced building, situate in a busy London thoroughfare. I should be grateful if any reader could give me his experience as to the danger of the life of the stone being shortened by any of the processes now in use, and also if any of the so-called preservatives are effective. I remember some years ago seeing samples of old stone treated with a solution to harden and preserve the face, and giving the appearance of new stone. Unfortunately, any literature I had has been mislaid, but my impression is that the manuacturer or inventor was a Frenchman.—Yours truly,

R. BISHOP.

Bermondsey.

Swadlincote.—On a site, given by Mr. John Hall, J.P., a public library has been built at a cost of £5,000, which has been defrayed by Mr. Andrew Carnegie. Mr. MacPherson was the architect.

Proposed New Works.

Aberdeen.—The Town Council propose to erect a new footbridge, in lieu of the existing Windmill Brae footbridge, on the Green.

Atherstone.—The District Council have applied to the L.G. Board for a loan of £1,300 to build offices and stores in Long Street. An inquiry was held on the 16th inst.

Bedford.—The Guardians have decided to enlarge the workhouse buildings, and an application to the L.G. Board for a loan is to be made.

Derby.—An extension of the buildings of the Royal Institution for the Deaf and Dumb is in contemplation. A design of a new block has been prepared by Mr. Arthur Eaton and approved by the Board of Education, which provides for twenty separate class-rooms, a room for instruction in cookery, and more dormitories and offices. The estimated cost of this, including furnishing, is £5,250, and the enlargement will provide accommodation for an additional fifty children, thus enabling the institution to take 200 instead of 150, as hitherto. In the new block a separate room will be provided for the instruction of each class. The funds are being raised by public subscription.

Derry.—The Irish Society in London has voted £5,000 towards the rebuilding of Derry Guildhall, which was destroyed by fire in April last. The condition attached to the grant is that the Council will clear the square in the centre of the city known as the Diamond, upon which the old School of Art now stands, and make it an ornamental open space. The offer of the Irish Society has been accepted by the Corporation, and a vote of thanks to that body unanimously passed.

Gloucester.—The Shire Hall is to be extended, and the properties adjoining have been acquired for the purpose.

Hawick.—An amended design for new public baths has been prepared by the Burgh surveyor, £4,000 being the estimated cost. It was originally proposed to acquire the Exchange Halls and fit them up at a total cost of £7,800.

Llandudno.—The Carnarvonshire Joint Police Committee are considering the question of a site for new County Police Buildings. The purchase of 1,680 sq. yards of land in Oxford Road for £882 has been referred back for further negotiations.

Nantwich.—The design of Mr. H. H. Brown, architect, of 17, Dickinson Street, Manchester, has been accepted for proposed new Council school in Beam Street, to cost £10,000.

Pulborough, Sussex.—A public meeting of the inhabitants has decided to erect a public hall here, and subscriptions are being collected for the purpose.

Rotherham.—By a majority of one vote the Guardians have decided to consider the erection of a union infirmary in one of the country districts around Rotherham. The treatment of phthisical cases is the purpose in view.

St. Anne's-on-the-Sea.—A fund has been started for building a new Baptist Church.

Seaton Burn.—A Presbyterian Hall is to be erected here, at a cost, including site, of £668.

Scorton, Yorks.—The Home for Incurables, administered by the English branch of the Brotherhood of the Order

of St. John of God, is to be rebuilt. A public appeal is being made for £16,000 for the purpose.

Stirling.—It is proposed to build a church, to be called "The Bruce Memorial" Church, for the United Free Congregation of Cambusbarron. The cost is estimated at £1,000.

Swanage.—The Urban Council have passed plans for the following:— Mr. L. P. D. Way, a villa in Durlston Road; Mr. F. W. Pond, a house in Priest's Way; Messrs. Parsons and Hayter, a bathing house on the beach, and four shops in High Street.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible.
The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.
The querist's name and address must always be given, not necessarily for publication.

Slabbing Glazed Tiles.

BIRMINGHAM.—E. L. T. writes: "I wish to know the correct method of 'backing' glazed tiles to form slabs and interior grate surrounds. Would either of the following be suitable: 1. Portland cement and sand—reinforced with metal lathing 1in. mesh, to finish 1½in. thick. 2. Keene's cement and sand and ditto, but with ¼in. mesh iron wire. 3. Equal proportions of hair, mortar, sand, and plaster wetted up with glue, the tiles being soaked in *warm* water—no reinforcement; eyelets being arranged in each case to receive cramp for fixing."

Either of the three methods named might be adopted with success; No. 2 is probably to be preferred, though No. 1 is almost equally good if the slabs are not expected to stand high temperatures after fixing. G.

Lining Storage Tank.

LONDON, E.C.—"SUMP" enquires: "Whether the asphalt lining of the storage tank shown (sketch not reproduced) is likely to bulge from face of brickwork if the ground outside should become waterlogged; or whether any pressure so caused would be resisted by the pressure due to head of water in the tank, which is constant. For the purposes of the case the brickwork is assumed to be porous."

It would be better to use one of the building compositions, which, as you probably know, are used to form a thick impermeable joint in the centre of the wall. The pressure of the water in the tank might not be constant, and if the asphalt became detached from the wall it would sink or fall over.

Architectural Posts Abroad.

LEICESTER.—C. writes: "Could you give me any information as to the best way of advertising for an architectural post in the Colonies or the United States?"

Your best plan would be to advertise in either the United States or the Colonial technical newspapers. At the same time we do not think there are any openings abroad except in the South American States, and perhaps European countries. You can refer to a letter from a Canadian correspondent in our last issue. South Africa, we have been told by one or two architects who have returned, "is dead," so far as architecture is concerned. There are possibilities in Egypt, India, Burmah, or the Straits Settlements; but these possibilities are only open to the man on the spot. A good firm of advertisement agents would furnish you with all particulars.

The Number of Practising Architects.

PLYMOUTH.—SCRAMBLE writes: "Can you inform me about how many architects are at present practising (a) in London, (b) in England?"

The London Directory for this year gives the names of about 1,200 firms practising in the City and suburbs of London, or roughly just over 2,000 if partners are counted separately. The Building Trades Directory gives the number of provincial practising architects at about 3,900, so that the total number in England is probably between 6,000 and 7,000.

Federation News.

CONFERENCE OF SECRETARIES.

The annual Conference of Secretaries of the National Federation took place at the offices, 31 and 32, Bedford Street, Strand, London, on Tuesday, October 20th, Mr. E. J. Brown, senior vice-president of the Federation, in the chair. Several matters were discussed, and a number of papers read which will appear in our columns. The first, on "Federation Benefits," by Mr. A. G. White, the National Federation Secretary, will appear next week.

YORKSHIRE BUILDERS AND MUNICIPAL WORKS DEPARTMENTS.

Nearly fifty representatives of the building trades Associations in Yorkshire attended on October 22nd the monthly meeting of the Yorkshire Federation of Building Trades Employers, which was held at the Grand Central Hotel, Leeds, Mr. J. Biggin, Sheffield, the president, in the chair. The principal item on the agenda was a paper by the secretary (Mr. J. Davidson) on "Municipal Works departments." Mr. Davidson dealt with the subject under three aspects:—(1) The quality and expedition of the work; (2) Comparison of cost; (3) General labour position. With respect to quality of work, he said, it is not seriously contended that the works carried out by employees of a corporation are better than works carried out by private contractors. Under both methods works have been executed that are structurally sound and substantially well built. The Manchester Corporation decided that they would have nothing to do with the establishment of a works department, and were of opinion, by 69 votes to 10, that their work could be better carried out by contractors. As an instance of the slow progress made in work carried out by corporation employees, and the consequent increased expense, he mentioned the case of the Huddersfield reservoir, which was estimated to cost £150,000, but after works had been carried out for several years by direct labour at a cost of nearly £300,000, they were found to be unsatisfactory. The completion of the works was let to a contractor for £78,000, and these were executed to the full satisfaction of the corporation within a period of two years. Again, in London, works took four years to execute which the engineer reported should have been completed in eighteen months. Sir Alexander Binnie, though he had been a supporter of the works department, admitted, in reporting upon drainage works at Woolwich, that the actual cost exceeded the estimate by £16,000, and that the work had "taken four years to execute, whereas it should have been completed in eighteen months."

Another fallacious argument used for the establishment of works departments, said Mr. Davidson, is that they save the contractor's profit. That this is a complete travesty of the actual facts is abundantly testified by the experience of such departments in all parts of the country. At Huddersfield, Sheffield, West Ham, etc., these departments had been abandoned. In Manchester the official report admitted that the cost of excavating work carried out by the regular staff averaged 156.83 per cent. more than contract work. Labour leaders in Manchester, he added, were bound to admit that public work done by the corporation workmen cost, in some cases, three times as much as similar work done by private contractors. Work carried out by a Salford firm for 1s. 6d. per cubic ft. cost the ratepayers no less than 4s. 9d. when done by corporation men. Work executed by the regular staff was often not measured, nor the time so kept that accounts could be accurately made up and the actual cost definitely ascertained. For many years the engineer and architect of the London County Council had prepared estimates of the costs of the works planned by them, and a further estimate had also been prepared by the works manager. There was authority for the remarkable statement that there had been a difference of 50 per cent. between the two official estimates, and, as the highest price was taken as the approved estimate, the works department thus had a handsome margin of 50 per cent. before work was commenced.

In illustrating this point, Mr. Davidson mentioned the following cases:—In 1904 the London County Council had five large main drainage works in hand. The engineer's estimates were £770,747; the accepted tenders amounted to £584,903, or £185,844 below the engineer's estimate, a saving of nearly 25 per cent. For Section 3 of the new northern low level sewer, between Stepney and Trafalgar Square, the estimate of the works department was £299,800, while the accepted tender, that of one of the most respectable firms of contractors in London, amounted to £261,599, a direct saving of £38,201. A very noteworthy instance was that of two blocks of buildings erected under the Houses of the Working Classes Scheme, absolutely identical in size, design, and material used, and built at the same time and under the same conditions as to cost of labour and material. The Cookham buildings (erected by a contractor) cost £14,059, while the Hogarth Buildings (erected by the works department) cost £15,030, or nearly £1,000 more, an excess of 6½ per cent. over the exactly similar work done by the contractor.

In Leeds, a committee brought forward a recommendation to accept the estimate of the works department amounting to £22,000 for works of street improvement. The matter was referred back in order that estimates might be obtained, and ultimately a recommendation of the committee to accept a tender amounting to £17,130 was adopted, and a saving of £4,870 effected.

The report of the works committee of the London County Council with regard to the Horton Asylum work carried out by the works department showed the large excess of cost over estimate of £37,878, or 13 per cent. A works department for special repair work was absolutely untenable and financially unsound. The provision of an alcove at the Girlington recreation ground for the Bradford Corporation cost £227, against an estimate of £163, an excess of £64, or 38 per cent. above the estimate. The Leeds Corporation carried out works of street construction in the Gledhow district at 34s. 4d. per lineal yard, whereas similar work in the same district was carried out about the same time by contractors for 25s. 6d. The owners appealed to the Local Government Board against the excessive charge, and after a local inquiry had been held, and evidence had been given by both parties, the Local Government Board reduced the claim of the Corporation from £541 2s. to £416 10s. 10d., and a direct loss of £124 11s. 2d. thereby fell upon the ratepayers as the result of the mischievous experiment of carrying out works on behalf of private owners by direct labour instead of contract.

In their excess of zeal for municipal work, the Bradford Corporation formed a team labour department, and, notwithstanding the fact that it had been bolstered up by charging the other departments at a rate per day in excess of that previously paid to contractors, the department had for some years been worked at a considerable loss, involving a serious charge upon the rates. A most unsatisfactory feature in connection with the structural and jobbing work carried out by local authorities was the incomplete and imperfect manner in which the accounts of such works were kept.

An argument, said Mr. Davidson, which is often advanced in favour of works departments was that they afforded higher pay and shorter hours of labour for workmen. This statement, he remarked, was founded on gross ignorance or wilful misrepresentation, for it was apparent that they could not create more work or find greater employment. Works departments, he maintained, were not only against public policy, but were calculated to reduce the supply and efficiency of skilled labour. Local authorities did not accept apprentices; they drew absolutely for skilled labour upon those who had gained their experience and training under private contractors. The present unemployed were largely recruited from the ranks of unskilled labourers, and the growth of works departments and the corresponding reduction in work caried out by contractors was calculated in a few years to reduce most seriously the number of skilled workmen and to increase still further the number of unskilled labourers, with all the economic disadvantages accruing therefrom.

Building trade employers had also the advantage in their relations with workmen by the establishment of conciliation boards. Strikes or lock-outs could not be resorted to until disputes had been heard by three boards. The amicable relationship which exists between building trade employers and employees in Yorkshire was strongly emphasised by the fact that only one or two disputes had been heard by the conciliation boards since their formation three years ago. On the other hand, corporation employees often resorted to strikes; there were instances of violence accompanying these strikes, notably the recent tramways strike at Halifax, and the gas strike in Leeds some years ago.

Labour members often argued that the advantage of a contractor in the despatch of work was obtained by the sweating of the men. This was a complete fallacy. It was freely admitted in Manchester that the principal reason for the increased cost of municipal work as against private contracts was that the corporation workmen had not done their simple duty, and that the work had been shirked. In London the advocates of municipal trading had had to make frequent appeals to the workmen to do an honest day's work for an honest day's pay. In this connection, the statement of a member of a deputation from the Labour party complaining before the General Purposes Committee of the London County Council of the method adopted by the works department towards the men in their employment was interesting and important. He said he would prefer that the work should be done by a contractor rather than the works department, because the contractors treated their men better than the works department. This Labour testimony, remarked Mr. Davidson, should effectively dispose of the outrageous sweating allegation. But this experience was by no means exceptional.

As to the comparison of cost of labour under labour administration, he stated that it was not possible in England to obtain definite information on the subject. Australia, however, afforded some reliable comparison of the disastrous effects of putting into practical use some of the unsound economic theories advanced by the Labour party. At a place in New South Wales the cutting of drains for water supply was let by contract at £16 per mile. The Government, however, interfered, and caused the drains to be cut by day labour under the direction of officials of the public works department. The cost of cutting a mile of drains on this system came to £96, though the wages of the day labourers were no higher than the earnings of the contractor's men who worked at piecework rates. The stimulus of proportionate reward being absent, and the supervising officials having no direct interest in making the supervision efficient, the productive capacity of the labour employed fell off to just one-sixth of what it was before. A further example from Western Australia of a water scheme carried out by day labour under official direction was also given, the ultimate cost of pipe laying and jointing work being about £100,000 more than the estimate.

Mr. Davidson concluded by stating that the irrefutable facts he had set forth should appeal to the judgment of members of local authorities and to the public generally. Consideration of them would lead to the firm conviction that the truest interests of the workmen were not advanced by municipal trading, that it was most unfair to private traders, that its continuance was against public policy, and that it was indefensible on financial grounds.

On the motion of Mr. Mansfield, York, seconded by Mr. Sinclair, Scarborough, the paper, after being slightly amended, was approved. Several delegates spoke in commendation of it, and strongly advocated its wide circulation. It was finally resolved, on the proposition of Mr. W. R. Thompson, Dewsbury, seconded by Mr. Mansfield, that five thousand (or more if necessary) copies of it should be printed for circulation among the federated associations and county federations in the kingdom.

Bath Builders and Unemployment.

On Monday, October 12th, seven members (comprising the committee) of the Bath Master Builders' Association met, by invitation, the seven secretaries of the various local branches of the building trades unions of the district, to consider the present question of unemployment in the building trade in the City of Bath, and, if possible, to suggest means of alleviating it.

Mr. J. W. Knight, J.P., president of the Bath Master Builders' Association, and Mayor-elect, was in the chair, and opened the proceedings by giving the reasons for calling a conference of employers and employees. After much discussion, all present agreed to a resolution the effect of which will be to shorten for at least the next three months the working hours of all trades. This revision of the working rules would, it was hoped, afford some degree of relief, as it would have the effect of giving employment to ten men instead of nine. It is understood that the majority of the local firms will agree to this proposal, and that probably all will fall into line as soon as the necessary arrangements can be made. Mr. F. J. Blackmore, who is engaged in building the new nurses' homes for the Royal United Hospital, hopes to have the sanction of the committee of that institution to extend the time for the completion of his contract, in order that he also may be able to fulfil the terms of the resolution, which are as follows: "That, with a view to meeting the present lack of employment, this conference of master builders and local secretaries of trades unions in the building trades agree to a reduction of working hours from Saturday, October 17th, until January 24th, 1909, viz., work to commence at 8.0 a.m. until 12.0 noon, and from 1.0 p.m. until 4.30 p.m. To cease work on Saturdays at 12.30 p.m., being 42 hours instead of 56. These rules to apply to all, working in and out of doors." A copy of this resolution has been forwarded to the town clerk, asking him to endeavour to get the various corporation committees to agree to the above hours for all their employees.

Northampton Association Annual Dinner.

The thirty-second annual dinner of the Northampton Builders' Association was held at the Angel Hotel, Northampton, on Thursday evening, October 15th, the president, Mr. Edwin Archer, in the chair. He was supported by the Mayor (Mr. T. L. Wright), Councillor Henry Martin, J.P., Mr. W. Hull, Mr. A. Fidler (Borough Engineer), Mr. R. W. Harris (vice-president), Mr. F. Tomlinson (Water Engineer), Mr. Arthur Airs (secretary), etc., etc. Following the loyal toast, Mr. H. W. Hanwell proposed the toast of "The Mayor, Magistrates and Members of the Corporation." The Mayor and Mr. Henry Martin, J.P., replied. Mr. J. J. Martin proposed "The Architects," coupling with the toast the name of Mr. W. Hull, and remarking upon that architect's homely way of impressing upon builders that even moles and worms were more systematic in their earthwork than some so-called builders. In reply, Mr. Hull complimented the builders of Northampton on the excellence of their work. Mr. Shaw, who also replied, said that he was old enough to re-

collect when there were only three architects in the town—now there were seven times that number. Mr. John Brown, jun., commented upon the competition of the builder-architect, which he was afraid would grow and crush many a smaller man. Mr. Redwood proposed "Success to the Northampton Builders' Association." He thought that a spirit of loyalty was to be found in the Association. They tried to do away with unfair dealing, and exercised a good influence in any dispute that might threaten. Despite complaints of bad trade, the builders had managed to get a living. What they wanted was not a lot more work, but work of a more remunerative kind, and of a character to do credit to those who were so well able to carry it out. The president then made a suitable acknowledgment. He was afraid that the trade was going through seven lean years, and he trusted that ere long matters would improve. Mr. G. J. Fisher toasted "The Visitors," and Mr. J. F. Stops, replying, mentioned how sorry he was not to see Mr. F. J. Airs present, he having been the devoted secretary for more than 31 years. Mr. John Bird proposed "The President," and eulogised his sound business abilities and his continued loyalty to the Association. Mr. Henry Green, in proposing the toast of "The Vice-President" (Mr. R. W. Harris), commended the excellent rule the Association has of electing a different president each year, and thereby creating a wider interest amongst the members. Referring to some of the grievances of the trade, he thought the architects could not altogether be blamed for employing specialists to fix what they make; but such sub-contractors should be bound by the same conditions as the builder, and not be paid earlier; they should in some way indemnify the builder in the matter of workmen's compensation insurance. Mr. R. W. Harris suitably replied. Mr. A. P. Hawtin, in proposing "The Secretary," spoke sympathetically of the failing eyesight which prevented the former secretary (Mr. Airs, sen.) from being amongst them. The secretary, in reply, assured them of his appreciation of their kind sentiments.

The large business premises which are just rising above the ground in the Market Place, Burton-on-Trent, from the design of Mr. Forshaw, are to be fireproofed on the "Fawcett" system. The steelwork throughout the buildings is being supplied and fixed by Messrs. Mark Fawcett and Co., of Westminster and Greenwich.

Trade and Craft.

"Fibro-cement" Compressed Roofing Slates and Non-compressed Sheets.

The fibro-cement compressed roofing slates were introduced by C. Zerenner and Co., Norfolk House, Laurence Pountney Hill, E.C., five years ago. They are non-absorbent and practically indestructible, even in atmospheres charged with sulphurous fumes. They also possess very considerable mechanical strength, which is a most important characteristic for a roofing material. The material, being a mineral product, is impervious to vermin, is not liable to rot, and its insulating properties render it not only suitable for buildings in which a regular temperature is required, but also very suitable for switchboard work. At the port of Havre, where the violence of the storms puts roofing material to the severest test, Messrs. C. Zerenner and Co. delivered about 350,000 of their asbestos slates. The custom house and the railway station at Boulogne, as well as Bennett's shipping offices, have also been roofed with these slates. Further, the cavalry barracks at Aldershot, the gun factory at Woolwich Arsenal, etc., etc., and barracks at H.M. dockyards at home and abroad, have been roofed with "Fibro-Cement."

The "Fibro-Cement" non-compressed sheets made by the same firm constitute, we are informed, an excellent fire-proof lining for walls, ceilings, partitions, doors, ventilating shafts, etc. They measure about 8ft. by 4ft., and 4ft. by 4ft. by 3-16th in. thick, and can easily be cut to any size by a saw, and render partitions sound-proof and damp-proof, as well as fireproof. It is claimed that the sheets are of such a rigid nature that, when nailed to standards or studded, they actually increase the strength of the structure. "Fibro-Cement" sheets can be joined, fitted, etc., by anyone, no unusual or special knowledge being required in handling them.

For door panels, "Fibro-Cement" sheets are not in the least degree subject to the usual expansion and contraction due to the damp atmosphere of winter or to the furnace heat of summer. Panels made of this material can be painted or veneered to suit individual tastes. An additional advantage of having doors and walls constructed of this material is that it makes practically a fire-proof partition between the rooms of a building, be it a private residence or a factory. Where it is desired to cut down insurance rates and to ensure personal safety from fire by confining it to the floor in which it originates, "Fibro-Cement" sheets may be used upon the rough floor. The finished floor may then be laid immediately upon these sheets, the whole being securely nailed in the usual manner. These sheets, it is claimed, are not only fireproof, but at the same time form an indestructible barrier against the gnawing of mice, rats, and other vermin, which are often the cause of making apertures sufficiently large to allow the passage of flame. "Fibro-Cement" has been approved by underwriters.

Prominent at the Electrical Exhibition in Manchester is a house erected, furnished, and decorated by "Goodalls," of King Street, Manchester, as a means of demonstrating the value of electricity in the house. The house is about 120ft. long, and one storey high, built with rough-cast trellised walls, and roofed with warm-coloured tiles, having its projected windows filled with painted glass, while the canopied carved doorway is surmounted by a stone panel bearing the arms of the Moseleys, who were lords of the manor of Manchester. The interior decoration and fittings maintain the firm's reputation for taste and resource.

Bankruptcies.

CUMMING, E. H. S., builder, 19, Merivale Road, Harrow. P.E., C.C., St. Albans, Nov. 17, at 10.30. (Amended notice.)

ROBERT ADAMS' NEW INVENTION.

IMPORTANT TO ARCHITECTS & BUILDERS.

REVOLUTION in Silent Door Spring Hinges.
A New and Wonderful Floor Spring for Double and Single Action Doors.
Absolutely the Shallowest, Most Perfect, Powerful and Efficient Spring ever invented.
Half the size, Thrice the Value and Durability of others.
Its unique Sealed Check Chamber is Impervious to Water, and an immunity against oil-stained floors.
It is calculated to increase the demand for double and single action Door Springs, even more than my original celebrated and now Universally used 1870 patent Spring and Adjustable Shoe.
Such a Shallow Box as referred to above has never before been known to be practicable. It has been specially designed for the shallowest floors, to suit the exigencies of modern construction.
Robert Adams' other Specialities include New Patterns in Fanlight and other Opening Gearing, Panic Bolts, Weather and Water Bars, &c., &c.
Particulars on application to the Patentee:

Plans and sections may be seen and the specification, bill of quantities, and form of tender obtained of Geo. W. Warr, surveyor to the council, town hall, Southwick, between 9 a.m. and 5 p.m. (Saturdays 9 a.m. to 1 p.m.). One guinea will be required as a deposit. Tenders, endorsed "Private Street Works," to be delivered by noon on Oct. 31, to J. E. Dell, clerk to the council, town hall, Southwick, Sussex.

Nov. 2. NEWBURN.—Supplying tar macadam to the U.D.C. Forms of tender may be obtained from Thomas Gregory, surveyor, council offices, Newburn. Tenders to be delivered by noon on Nov. 2, to George Wilkinson, clerk, 1, Mosley Street, Newcastle-upon-Tyne.

Nov. 2. ROMFORD.—Supplying 350 tons of best quality blue Guernsey granite, broken to 2 in. cube, and 500 tons best quality blue Guernsey granite, broken to 1½ in. cube; also 500 tons of Rhenish basalt stone, broken to 2 in. cube, for the R.D.C. Specification and form of tender may be obtained from George Lapwood, highway surveyor, Victoria Chambers, Romford. Sealed tenders, endorsed "Tender for Granite, etc.," together with samples of granite and stone, to be supplied, must be sent, carriage paid, to reach William Smith, clerk to the council, 13, North Street, Romford, by Nov. 2.

Nov. 2. HENDON.—Supplying about 500 tons of clean pea or bean shingle; about 500 tons of clean brick rubbish; about 500 tons of coke clinkers; about 300 yds. cube of hard burnt ballast; about 150 tons of Thames ballast, for the U.D.C. Forms of tender and all further particulars may be obtained of S. Slater Grimley, engineer and surveyor, council offices, Hendon, N.W. Tenders to be sent (accompanied by samples of the material), addressed to the chairman of the council, by 5 p.m. on Nov. 2.

Nov. 3. BRENTFORD.—Supply and delivery of 1,500 of best hard Guernsey granite spalls, for the guardians of the union. Forms of tender may be obtained upon application, and tenders upon such forms must be delivered by 4 p.m. on Nov. 3, to William Stephens, clerk to the guardians, Union Offices, Isleworth, W.

Nov. 3. ISLEWORTH.—Supply and delivery of 1,500 tons of best hard Guernsey granite spalls, for the guardians of Brentford Union. Forms of tender may be obtained upon application, and tenders upon such forms must reach William Stephens, clerk, Union Offices, Isleworth, W., before 4 p.m. on Nov. 3.

Nov. 3. EALING.—Making up the accommodation road at the rear of Haven Parade, for the Corporation. Drawings and specifications may be seen, and form of tender, together with schedule of quantities and other particulars, obtained from Charles Jones, M.Inst.C.E., borough engineer, town hall, Ealing, W., any day during office hours, upon deposit of 10s. 6d. Sealed tenders, in the envelopes provided, endorsed "Tender for Making-up ————," must be delivered by 9.30 a.m. on Nov. 3, to Geo. E. Brydges, town clerk, town clerk's office, town hall, Ealing, W.

Nov. 4. HERNE BAY.—Supplying granite kerb, channel, settes, siftings, chippings, etc., for the U.D.C. Specifications and forms of tender may be obtained from F. W. J. Palmer, C.E., surveyor to the council, town hall. Sealed tenders, endorsed "Granite," to be delivered by noon on Nov. 4, to Joseph Jubb, clerk to the council, town hall, Herne Bay.

Nov. 4. LITTLEHAMPTON.—Taking up old pavements, and providing and laying in various roads, in the district about 350 lineal yds. of pennant kerbing, 350 lineal yds. of pennant channelling, 2,800 sup. yds. of flag pavements, together with carriage crossings and sundries, for the U.D.C. Specification can be seen, also maps and drawings, at the office of the council's surveyor, H. Howard, F.S.I., of whom forms of tender and quantities can be obtained. Tenders, under cover and marked "Paving Works," to be forwarded to the chairman of the council, town offices, by Nov. 4. Approved security will be required.

Nov. 6. LUTON.—Paving and other works of private improvement in Brantwood Road and Wimborne Road, for the town council, in accordance with plans, sections, and specifications prepared by the borough engineer, and to be seen at his office, town hall, Luton. Separate tenders for each street, endorsed "Private Improvement Works," must reach Bruce Penny, town clerk, town hall, Luton, by 4 p.m. on Nov. 6.

Nov. 9. STREATHAM.—Making-up and paving that part of Mitcham Lane, Streatham, lying between Moyser Road and the borough boundary, for the Corporation of Wandsworth. Specification and drawings may be seen, and forms of tender obtained, at the borough engineer and surveyor's office, New Streets Department, 56, East Hill, Wandsworth, S.W., between 10 and 4 (Saturdays 10 and 12). Tenders, enclosed in separately sealed envelopes, and endorsed "Tender for Paving Mitcham Lane," must be delivered at the council house, East Hill, Wandsworth, S.W., and may be placed in the box provided for the purpose by 4 p.m. on Nov. 9. If required, the contractor must provide two sureties for the due execution of the contract. Fair wages clause.

Nov. 9. WANDSWORTH.—Works of repair upon that part of the carriage-road called Princes Road, Southfield, lying between West Hill and Augustus Road, for the corporation. Specification and drawings may be seen, and forms of tender obtained, at the borough engineer and surveyor's office, New Streets Department, 56, East Hill, Wandsworth, S.W., between 10 and 4 (Saturdays 10 and 12). Tenders, enclosed in separately sealed envelopes, and endorsed "Tender for Repairing Princes Road," must be delivered at the council house, East Hill, Wandsworth, S.W., and may be placed in the box provided for the purpose by 4 p.m. on Nov. 9. If required, the contractor must provide two sureties for the due execution of the contract. Fair wages clause.

MISCELLANEOUS.

Oct. 31. HAUGHTON-LE-SKERNE.—Scavenging the parish of Haughton-le-Skerne, for the Darlington R.D.C. Forms of tender may be had on application to W. Pallister, Union Offices, Darlington.

Oct. 31. DARTMOUTH.—Extension of footpath at Higher Victoria Road. Plans and specifications can be seen and all particulars obtained upon application to Thos. W. Joyce, A.M.I.M.E., F.G.S., borough surveyor. Tenders, sealed and endorsed "Victoria Road Footpath," must be in the hands of the town clerk by noon on Oct. 31.

Oct. 31. MANCHESTER.—Supplying buff terra cotta required in new secondary school for girls, Chorlton, Street, Manchester, for the education committee of the corporation. A copy of the quantities may be obtained at the education office, Deansgate, Manchester, on a deposit of one guinea. Drawings can be seen at the education office. Cheques should be made payable to the accountant. Tenders, on forms provided, addressed to the chairman of the sites and schools buildings sub-committee, must be delivered at the higher education office, Sackville Street, by 9 a.m. on Oct. 31.

Nov. 3. HANDSWORTH, STAFFORD.—Brick and concrete flag paving work within the district, for the U.D.C. All particulars may be obtained on application to H. Richardson, Assoc.M. Inst.C.E., surveyor to the council. Sealed tenders, endorsed "Paving," to be delivered at the office of the surveyor, council house, Handsworth, Birmingham, by noon on Nov. 3. Fair wages clause.

Nov. 4. HERNE BAY.—Hire of a steam roller and scarifier for the ensuing year, for the U.D.C. Specifications can be seen and forms of tender obtained from F. W. J. Palmer, C.E., surveyor to the council, town hall. Sealed tenders, endorsed "Steam Rolling," to be delivered by noon on Nov. 4, to Joseph Jubb, clerk to the council, town hall, Herne Bay.

Nov. 6. EASTWOOD.—Constructing part of the new cemetery at Eastwood, including all relative works, for the Parish Council. Drawings may be seen at the office of Wharrie and College, C.E., 109, Bath Street, Glasgow, from whom copies of the specification, schedule of quantities, and form of tender may be obtained on payment of £1 1s. Tenders, on the form supplied, marked "Tender for New Cemetery," to be delivered by 3 p.m., on November 6, to D. Barrowman, clerk, Parish Council Chambers, 20, Harriet Street, Pollokshaws.

Nov. 9. RYTON.—Removal of house refuse and the cleansing of earth closets, privies, and ashpits within the district, for the U.D.C. Forms of tender and all particulars may be obtained on application to John P. Dalton, surveyor, council offices, Ryton.

Nov. 9. WESTMINSTER (for Madras).—Supplying 12,000 barrels (2,000 tons) of English Portland cement, for the Corporation. Full particulars and conditions, together with the printed forms of tender and contract, can be obtained from the agents of the Corporation, on payment of five shillings per set, which will not be returned. Tenders, on the forms supplied by the agents, and enclosed in sealed envelopes superscribed "Tender for English Portland Cement for the Corporation of Madras," will be received up to noon on Nov. 9, by James Mansergh and Sons, agents to the Corporation, 5, Victoria Street, Westminster, S.W., and must be accompanied by a deposit of £5.

The Wellington Monument.

Mr. John Belcher, A.R.A., sent an important letter to "The Times" last week on the subject of the Wellington Monument, urging that in view of the recent lamented death of Mr. Hugh Stannus, who was so long associated with Alfred Stevens, every effort should be made to collect and obtain the rough sketches and evidences of Stevens's ideas for the completion of the Wellington manument in St. Paul's Cathedral. Our readers are no doubt aware that an influential committee has in hand the completion of Stevens's work by placing on the top of the monument the equestrian statue of the Duke, for which the sculptor left behind a rough model. This model was preserved by the late Mr. Stannus, and was handed over by him to the Committee, who commissioned Mr. John Tweed to prepare a plaster cast from it, and this cast was placed in position to judge the effect. It then became evident that a certain amount of finishing would be required before the bronze could be cast, and after Mr. Tweed had carried out these modifications and refinements, the plaster cast was again tried in position. Whether the Committee are now satisfied with the improved model or not we are unable to say, but there appears to be some division of opinion whether the rider should face towards the east or the west. Mr. Belcher's letter is in the nature of a warning as to the stability of the monument, and its ability to bear the weight of the bronze group and its marble surbase. The evidence of Mr. Somers Clarke, F.S.A., late surveyor to the Dean and Chapter, goes to prove that the upper part of the monument is but a hollow box formed of thin sheets of marble, and that it will require some reinforcement to bear the proposed weight. Mr. Belcher states that long copper dowels were used by Stevens in the construction of the work, and these had to be sawn through when the monument was taken down and removed from the south-west chapel to the nave. He is unable to say whether these have been replaced; and as the marble has cracked at the base, there has apparently been some movement since the structure was re-erected. These facts seem to call for some statement from the Completion Committee, which we trust they will afford. We venture to think that everybody will be glad to see tardy justice done to one of the most gifted English sculptors by the completion of his greatest work in the manner he intended; but because of the great value of this work the Committee must expect from the public a certain jealousy of interference, and we trust that they will recognise that this does not emanate from any captious attitude towards their main idea. The fact that they possess funds for their work should not make them indifferent to public anxiety with regard to the monument.

Municipal Works Departments.

We notice, with more amusement than surprise, an attempt to attribute to mere political opportunism the attitude of the federated Yorkshire builders with respect to municipal works departments. The paper in which Mr. J. Davidson stated the case against municipal trading was printed in last week's issue, so that our readers have had an opportunity of judging whether or not it was free from political taint. Our own impression of it was that the *pros* and *cons* of the matter were sifted and weighed, not, perhaps, with judicial severity, but certainly with judicial care and impartiality, and that the author had sedulously avoided all tendency to mere rhetoric, depending for his effects upon the inherent strength of well-ascertained data and just deductions. That is how it strikes a disinterested observer. It appears, however that the "Yorkshire Daily Observer" is not disinterested. It declares that the Leeds meeting at which the paper was read and adopted was "an illustration of the astuteness with which private interests insinuate their influence into electoral contests. . . . When one remembers that at the present moment Leeds Tories are, in the elegant phraseology of their leader, seeking a mandate 'to smash the Corporation Works Department,' it is difficult not to suspect that the Yorkshire builders selected Leeds for this particular meeting with malice aforethought." The writer then proceeds to sneer at Mr. Davidson's arguments, but makes no attempt to controvert them. Like the preacher in the anecdote, having boldly looked the facts in the face, he passes on: to the consideration of such matters of pith and moment as the parlous state of Handel's organ and of the meat trade. As he writes under the happy heading, "Observatory," it is, in his own phrase, "difficult not to suspect" that he sometimes, "of malice aforethought," looks through the wrong end of the telescope, or that considerable allowance must be made for his "personal equation." Mr. Davidson has published a spirited reply that should at least remove this ill-starred journalist's difficulty of not suspecting. It is shown that the meeting at Leeds had nothing whatever to do with local politics or polemics, and that the fixture was arranged months ago, and quite independently of local affairs, by the Yorkshire Federation of Building Trade Employers; who, as he justly remarks, have every right to defend and advocate their corporate interests by every legitimate means. When, as in the present case, they are able to show that their interests happen to coincide to a nicety with those of the general community, the accusation of political opportunism is ludicrous; and, in any case, the political animus of this "Observer" is so blatant, that, even if he had substantiated his charge, "*Tu quoque*" would have been a sufficient answer.

The More Excellent Subway.

The Court of Common Council of the City of London accepted, on October 29th, the tender of Messrs. Perry and Co. for the construction of subways for pedestrians from the north-west corner of Blackfriars Bridge to Queen Victoria Street, with spurs going east and west. The work is to be completed in nine months. Well and good. "Slaughter Corner" will then lose its terrors, and humanitarians will be duly grateful for the concession. It seems, therefore, somewhat ungracious to grumble. But, seeing that the necessity for these subways is at length freely acknowledged, both in London and in Paris, and that the system is likely to be considerably extended, we feel justified in claiming that the entrances and exits ought really to look more lovely than a mere hole in the ground, with inartistic railings round it. This arrangement is a sort of obstruction. One is compelled, willy-nilly, to look at it, and it is one of the cardinal principles of courtesy and comity that what one is compelled to observe ought, as a matter of fair compensation, to be pleasing to the eye. While admitting that the sheer utility of the thing is in itself of the nature of "good consideration," we would nevertheless urge, as we have ventured to urge in these columns on a previous occasion, that subway entrances and exits offer an excellent opportunity for some sort of artistic display, by means of elegant ornamental ironwork, with perhaps the addi-

tion of groups of statuary, which would there have a more than ordinary excuse for their existence. We trust that such an excellent opportunity for helping on the beautification of London, by blending the *utile* with the *dolce*, will not be obdurately ignored. We are anxiously looking to Paris to show us, in this respect, the more excellent subway.

Flash Light Advertisements.

A letter in "The Times" of Monday last, signed by Mr. Ernest George, President of the R.I.B.A., makes clear the attitude of the Institute upon the vexed question of the electric signs and advertisements which nightly disfigure some of our principal streets and buildings. The Institute, it apears, is urging the London County Council to take measures for the stringent control of all public advertisements. With that course we are in entire agreement. But the reasons put forward by Mr. George for enlisting the support of "The Times" and its readers hardly seem to us convincing. We venture to think that the danger to pedestrians from the alternations of bright light and darkness, with the flashing advertisements, is somewhat exaggerated, and we think the mental irritation case is rather given away by the President's naive admission that it "seems to be hardly realised outside the medical profession." Why not state boldly and uncompromisingly, as it is within Mr. George's province to do, that these flashing light signs are abominably ugly, and a hideous disfigurement to the buildings to which they are attached? As to commercial rivals welcoming a restriction that would save their pockets—m'yes!

THE ARCHITECTURAL PROFESSION OF TO-DAY.—VIII.

Perhaps the chief of the many difficulties which beset the earnest student of architecture is that arising from the unfortunate fact that the best and most scholarly books on art can now only be obtained—if at all—on rare occasions, and then at a cost which renders them prohibitive to any but comparatively well-to-do men. Old and rare "first editions" of standard works are by no means necessary to the educational welfare of the future practitioner, for cheap reproductions of the original costly plates would serve his purpose equally well. Yet invaluable as a large and comprehensive collection of plates—reproduced from many of the valuable old works on architecture that are still extant—would be to a large majority of architects, we doubt the possibility of finding a publisher with sufficient enterprise to undertake their publication. And the reason is not far to seek. Scholarship among architects is now held in such small esteem that the sale of any architectural work which appeals solely to the profession is, necessarily, very limited.

Thus, although, *primâ facie*, it would seem there should be every prospect of a ready sale for a series of books for students, issued with the object of bringing examples of the best architectural writers of the past within the, generally, modest means of the young practitioner of the day, yet the experience gained by the few isolated attempts already made in this direction is not to be ignored. Without doubt the republication, in a cheap form, for the benefit of country or colonial students, of some of the most useful and instructive of the many costly works on architecture contained, for example, in the library of the Royal Institute of British Architects, would be excellent—for the student—but what of the publisher? Until more attention is paid by architects themselves to the acquisition of architectural scholarship—until there is more evidence than is forthcoming to-day of a general demand throughout the profession for architectural literature of the best possible kind, it is scarcely reasonable to expect the supply will be forthcoming. And yet it would be well nigh impossible to *over-estimate* the beneficial results to the advancement of the art of architecture, if the correct principles of design were thus widely disseminated throughout the profession.

The R.I.B.A. library, although now much used and appreciated by London students, is only available to country members for purposes of study on rare occasions, and we therefore think the pages of the R.I.B.A. journal might well become the medium through which many scholarly architectural publications of the seventeenth, eighteenth, and early part of the nineteenth centuries could be brought under the notice of the imperfectly trained architects of to-day.

The journal of the transactions of the R.I.B.A. is, we believe, merely intended to be a reflection of the proceedings of that body, but in our judgment it should possess features of far greater value to the architectural world. For instance, we think it should take a leading part in instructing the student in the fundamental essentials of his art, and thus become essentially a journal issued with the intention of assisting in a great and wide-

HOUSE NEAR LEICESTER. S. HARRISON AND SONS, ARCHITECTS.

spread movement instituted, either within or without the profession, for the formation of a thoroughly sound and efficient course of architectural education.

At present the subject matter of the journal of the Royal Institute of British Architects, although ably edited and produced, often makes dull and tedious reading. Lengthy reports of papers, delivered at the R.I.B.A. and elsewhere, on the planning and construction of buildings of such an extremely commonplace and prosaic nature as asylums, hospitals, electric lighting stations, and the like, only varied by the contributions of "specialists" (many of whom have "axes to grind") on sundry new methods of construction, or on diverse aspects of art craftsmanship, are singularly devoid of interest to many architects, much as they may be appreciated by the few members of the profession who may be, at the moment, 'specially concerned in the type of building or subject to which the papers refer. At the same time, while we have no desire to *underrate* the commercial value to the young practitioner of the information he thus obtains, we suggest that, after all, the subject matter contained in a lecture or written paper concerning the building of a special nature can often be far better assimilated and understood by the student after a close study of the actual structure than by any verbal or written description. For this and other reasons we think it is time some effort was made to render the official organ of the R.I.B.A. more useful to the average member of that body, and possibly this object could be best attained by the issue of carefully selected excerpts and plates taken from some of the valuable books in the reference library now only available for purposes of study, to the metropolitan members of the Institute. In view of the general lack of scholarship and learning to be found among architects, it is often amusing to hear successive presidents of the R.I.B.A. or its allied societies laying particular stress, in their inaugural or other addresses to students, upon the fact that the architect is ever a student. Is he indeed? We feel very much inclined to question the correctness of the statement, as in our view the average architect is far too prone to imagine, immediately he is in a position to commence practice, that his education is complete. How else can one account for the fact that, as a rule, an architect's artistic powers are not developed proportionately to the number of buildings he is called upon to design during the course of his practice? Can men who, perhaps, for some thirty or forty years have been engaged in designing building after building in which almost, from first to last, no distinct traces of any improvement in their powers of design are observable, rightly be described as "students"? We think not. Successful architects—in the commercial acceptation of the term — they may be, but what, we would ask, have men of this calibre done for the advancement of architecture? What for the good of their profession? What for the student of to-day?

We have already drawn attention at some length to the very general want of scholarship apparent in the work of many—nay, of most of the architects of to-day, and have attempted to show that this untoward hindrance to the welfare of a great profession may be traced to the following causes:—(1) To an utterly erroneous idea on the part of the public as to the financial aspect of the architect's calling, which, contrary to general outside opinion, is *not* one of a lucrative nature. The public fallacy as to the commercial value of an architect's practice has had the effect of causing a number of men to enter the profession who, artistically, possess no qualifications whatever, whilst others, again, have commenced practice and discontinued their architectural studies almost as soon as they became sufficiently masters of their work to be able to put together a set of working drawings. This misconception of the *nature* and *extent* of an architect's qualifications for his work has had a most disastrous effect upon the architecture of the whole country. It is perhaps not too much to say that to every *single* building, erected within the last few years, bearing evidence that its designer is a master of his art, there will probably be about fifty other buildings of approximately the same date, which exhibit unmistakable signs of their architects' utter lack of scholarship and consequent inability to discriminate between what is good and what is bad in art. (2) To the ridiculous nature of the qualifying examinations imposed upon the student of architecture by the Royal Institute of British Architects, under which no real test of the student's suitability for his chosen profession is made, inasmuch as the applicant's possession of the necessary amount of general culture and scholarship is *assumed, as a matter of course*. We do not suppose that the Institute's scheme of examinations was framed with the deliberate intention of allowing illiterate and ill-trained men to bring disgrace upon the whole profession. But by furnishing them with the means of defrauding the public—by allowing them to pose as properly qualified architects, when, as a matter of fact, many who have passed the examinations do not possess the requisite qualifications —the R.I.B.A. has shown its incompetency to deal satisfactorily with a great problem, upon the successful solution of which the future prosperity of the profession is, in a great measure, dependent.

HOUSE NEAR LEICESTER. S. HARRISON AND SONS, ARCHITECTS.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Nov. 9	*WHITLEY AND MONKSEATON URBAN DISTRICT COUNCIL.—Public Shelter to seat 1,000, and provide promenade accommodation for another 400, at a cost of £1,200. Premium of £20 to merge if successful design is carried out. The Council (with such advice as they may decide to obtain) will be sole arbiters. Particulars from J. P. Telford, Acting Surveyor to Council, may be obtained at his Office, Council Buildings, Whitley Bay, any week-day (except Saturday) between the hours of 10 and 11 a.m., and 4 and 5 p.m. Design, plan and estimate, in sealed covers, to be sent to the Clerk to the Council, Council Buildings, Whitley Bay.
Nov. 14	WHITEHAVEN. NEW PUBLIC ELEMENTARY SCHOOL, Irish Street, for 700 children. Limited to Cumberland architects. Plan of site and conditions from W. D. P. Field, Secretary, Education Committee, Town Hall, Whitehaven. No statement as to premiums or deposit.
Dec. 1	POSTER FOR BUILDING EXHIBITION, OLYMPIA, April 17th to May 1st, 1909. Premium £105. Open to Architects and Architectural Students only. Particulars and entry forms from H. Greville Montgomery, M.P., Exhibition Offices, 43, Essex Street, Strand, London.
Dec. 14	§BLACKPOOL. CENTRAL PUBLIC LIBRARY.—Premiums of £52 10s., £31 10s. and £21. Particulars and site plan from T. Loftos, Town Clerk, Town Hall, Blackpool. Deposit £1 1s.
Dec. 19	WHITTINGHAM. ANNEXE TO ASYLUM FOR PAUPER LUNATICS, for the Lancashire Asylums Board. Limited to Architects who are in practice and are ratepayers in the County of Lancashire. The new building is to accommodate 700 Inmates. Premiums of £100, £50, and £25. Particulars and plan of site from Leonard Colman, Law Clerk to Committee of Visitors, 8, Lune Street, Preston. Deposit £5 5s.
Dec. 31	*CORNWALL COUNTY OFFICES.—Designs and *Estimates* invited. Premiums of £50, £20 and £10. Premium for successful design to merge in Commission. Particulars from C. L. Cowlard, Clerk to County Council, Bodmin. Deposit, £1 1s.
No date.	SWINTON. New Schools in Cromwell Road for the Swinton and Pendlebury U.D.C. Limited to Architects having offices within ten miles of Manchester. Premiums of £50, £25, and £10. Instructions may be obtained by letter on or before November 5th, to W.T. Postlethwaite, Council Offices, Swinton, Manchester.

* *These competitions have been unfavourably reported upon by Correspondents.*

§ *The Council of the R.I.B.A. advises Members not to compete.*

Blackpool Library Competition.

We are notified that By Order of the Council of the R.I.B.A., members of that body are advised not to take part in this competition.

From a leader in the *Blackpool Herald* of the 23rd ult., we gather that the Blackpool Town Council has made various concessions under pressure from the R.I.B.A., and a threat from the Assessor, Mr. H. D. Searles-Wood, F.R.I.B.A., that he would decline to act unless the offending conditions were remedied. Had the Council followed the practical advice of Alderman Mather, three times urged upon the Council during the preliminary stages, this regrettable contretemps would not have occurred. Our contemporary states that "the objectionable clause stipulating that although an independent quantity surveyor will be appointed the architect would be held responsible for the accuracy of the surveyor's quantities underwent satisfactory modification, being altered so that the architect's responsibility ceases when he has assured himself that the quantities are reasonable and cover all the particulars that he contemplated in his design. Another concession granted was in the shape of an allowance for architect's travelling expenses, instead of including them in the architect's five per cent. commission. . . . We understand that over eighty applications have been made for copies of the conditions, and this fact indicates extensive professional interest in the competition." Apparently, in view of the R.I.B.A. ban, the concessions made were not sufficient or satisfactory.

In Parliament.

(*By our Press Gallery Representative.*)

Rosyth Docks.

On Thursday of last week, the First Lord of the Admiralty made an important announcement with regard to work at the Rosyth base.

In replying to a question by Major Anstruther Gray, and several supplementary questions, Mr. McKenna stated that invitations to tender for the main contract were being issued, and he thought the tenders were to be put in this year. No men could be employed at Rosyth until the contract was made, but there were now on the site five Admiralty workmen, and 107 men employed by the road contractor.

Granite on Admiralty Works.

Mr. McKenna has informed Sir Gilbert Parker that the only direct contracts for granite let during the last six months were for British granite setts for paving, amounting to £250. In the case of large works contracts, the granite was ordered by the contractor and not by the Admiralty, but it was understood that the cost of the granite to be used in the construction of Portsmouth Lock, the only big work for which a contract had been recently let, was about £55,000, and in this case the stone would be British.

On another occasion, Major Anstruther Gray suggested that the First Lord should insist upon British granite being employed for Rosyth Dock, but Mr. McKenna declared his inability to say anything about Rosyth.

New Cavalry Barracks.

Another big Scottish contract will be the erection of barracks for cavalry at Colinton, near Edinburgh. The site has been acquired; but, from inquiries I have made, it appears that the plans will not be ready for some time. The Director of Barrack Construction is now busy with them.

Military Huts of Papier-Mache.

Sir Gilbert Parker asked the Secretary for War if the War Office had in its possession full particulars as to the methods adopted in the Spanish army for housing the forces debarked at Casa Blanca, the system of constructing the papier-maché huts, field-kitchen, and hospital, and the cost of construction; and, if not, would the War Office think it expedient to instruct the Military Attaché in Madrid to procure full particulars?

Mr. Haldane, in reply, said the War Office is in possession of information regarding the types of huts used for housing the Spanish troops at Casa Blanca. No detailed information has been received regarding the Spanish field-kitchen or hospital. The latter is a hutment similar to those used as barracks for the troops. The field-kitchens are understood to be of the ordinary type, and it has not been considered necessary to call on our military attaché for a special report.

Foreign Slates for Army Buildings.

Mr. Haldane has informed Mr. Berkeley Sheffield that during the last two years 109,170 slates, of which 99,170 were of British origin and 10,000 of foreign origin, were used for slating the roofs of the barracks at Aldershot. The foreign slates were being used experimentally.

Ventilation of the House.

Sir Philip Magnus asked the First Commissioner of Works whether he could now see his way to take any steps to improve the ventilation of the House by the admission of fresh air through other channels than the floor, over which hundreds of persons trod during the day, bringing with them from the roads particles of organic matter, which, by the system now in operation, were forced into the air and distributed throughout the chamber. Mr. Harcourt, in reply, said it has already been shown by the inquiry before the Select Committee upon the subject, that nothing short of a radical reconstruction of the chamber would permit of an alteration of the system of admitting fresh air at the floor level. It should, however, be borne in mind that, in addition to scrupulous cleanliness, any small extent of vitiation in connection with the present system is probably neutralised by the rapid changes of air.

Miscellaneous.

Among other information given by the First Commissioner of Works, in reply to various interrogatories, was that the new gates and lamps at the Marble Arch were expected to be erected by the end of this year, that a definite date could not be fixed for the completion of the memorial statue to Queen Victoria in St. James's Park, as much depended upon the progress made in the next three or four months, and that he was unable to recommend that the road leading from Prince's Gate to Bayswater Road should be continued from the Serpentine in a straight line for Paddington Station.

The Wesleyan Connexional Building at Westminster is likely, Sir Robert Perks recently told an interviewer, to be ready for use by the spring of 1911. It is to be called Victoria House, and will include a great hall with 2,500 seats. The cost is estimated at £146,580, the lowest tender, that of Messrs. Dove Bros., of London, having been accepted.

* * *

Association of Teachers in Technical Institutions. — The annual general meeting of this association will be held at the St. Bride's Institute, Bride Lane, Fleet Street, E.C., on Saturday, November 7th, commencing at 3 p.m. The annual meeting of the London branch of the association will be held at the same place in the evening, commencing at 6 p.m. At 7 p.m., a paper will be read by Mr. W. J. Lineham (chairman of the branch), on "Technical Education at the Franco-British Exhibition, 1908."

* * *

Preliminary work upon London's new County Hall, which is to be built on the south side of the Thames, and east of Westminster Bridge, at an estimated cost of rather more than a million sterling, is to be started very shortly. At the meeting of the London County Council on October 27th, the Establishment Committee recommended the acceptance of a tender of £62,662 for the construction of the embankment wall and incidental work.

R.I.B.A.

The Presidential Address.

The seventy-fourth session of The Royal Institute of British Architects was inaugurated on Monday last, November 2nd, at 9, Conduit Street, W. Mr. Ernest George delivered his first Presidential address as follows:—

I am called upon to-night to give my views on architecture and its present position, for such a pronouncement is expected of each President. I speak with diffidence, knowing there are those here at whose feet I well might sit. Still, it takes many sorts to make a world, and during a lifetime we each acquire some knowledge or personal outlook that may be worth imparting.

In the days of my pupilage the battle raged around the Styles. Students who sought medals and architects who entered upon competitions felt that their chances depended largely upon whether the Assessor was a Gothic or a Classic man. The Law Courts were leaving their ancient Hall at Westminster, and it was decided that there new home should be of Gothic character. For the new Government offices Sir Gilbert Scott's Gothic scheme was chosen, when, with a change of Ministry, he was required to convert his design from its mediævalism to that which we see now. A religious revival and church building era was entered upon. Following the Pugins, Gilbert Scott and George Street were building and writing, while John Ruskin in beautiful and forcible language set forth his own views of art and its aims, and enthusiasm was stirred.

From the vernacular mode of building, with its sobriety and dulness, there was a reaction. Gables broke the sky, and there was a general movement for the Picturesque, which, though one of the various forms of architectural charm, is not the highest. Medley took the place of lost traditions, and it was questioned if order or harmony would ever be touched again.

Well, after all the experiments we have been through in styles of various periods, whether the *motif* were Gothic, François-Premier, or Dutch, we seem now, at least in our street architecture, to be approaching a common language in a version of English Renaissance; a style that is not rigid in its laws, and which adapts itself to varying requirements and uses. At the same time, individuality is somewhat lost, and the architect's handwriting cannot always be identified. In the competition drawings for the County Hall, lately seen together, it was curious to note how little one author was distinguishable from another, with any certainty; the compositions were good or bad on very similar lines.

The possibility of all working again in a universal style has often been discussed; I do not think it will ever be attained, nor do I feel sure that it would be a gain. We should be the losers if our painters, writers, and musicians were all of one school. Those who desire uniformity probably hope that their neighbours will make the change of step. In earlier days, while tradition lasted, it was natural for all to work in one manner. There are now too many forms in our vocabulary, to be set aside by a process of selection.

We are a *free* people, and we feel at liberty to do what we please, especially with a freehold possession. Certain laws are enacted and enforced for the sanitary fitness of buildings, the safety of construction, and the prevention of fire; but there is no law to protect us from monstrosities, and our sense of beauty may be constantly wounded, much as the senses are pained by street music and by the noise and stench of motors.

It is seriously under consideration whether rules and conditions of building may not be made to secure us against flagrant breaches of taste, at least in our streets, designs being submitted, before perpetration, to some constituted authority or committee of taste. I am fully aware of the difficulties or drawbacks to such a scheme. We must avoid dictation from mere official judgment, which would often be irritating and probably blind to a work of genius. A Vigilance Committee under a Minister of Fine Arts might not always act wisely, and would possibly be composed of old-school men with their prejudices, perhaps including a time-being President of the Institute.

Among ourselves we might have a Consultative Committee of three or four men of judgment, to whom, as a matter of grace, designs would be shown, with adjoining buildings indicated. Errors of taste could thus be pointed out before being committed to stone. In great Public Works such consultation would be valuable, and in France we find leading men working in unison to the advantage of their art.

We must always regret the opportunity lost in the Strand, the County Council having taken expert advice on a grand scheme for rebuilding that quarter of the town, a scheme which was allowed to die a natural death. My personal feeling is against the rigid following of a set elevation through the length of a street. We do not wish to see London "Haussmannised." Violent diversity should be avoided, while the cornices and leading lines of buildings should be taken up where practicable.

The case of the Regent Quadrant is exceptional, and we value the decision of the Crown that the original scheme of Nash shall be followed in a glorified form, as we already see it in the strongly characteristic new portion just completed. It is at the sky-line that the beauty of the curve or sweep of the Circus can be appreciated, and this line can only be preserved by the following of one design. It is, nevertheless, a misfortune that in this first note of this new harmony, havoc has been made of the said sky-line, for back buildings which come very near to the front are jumping up in a most unrestrained way. The Circus carried out on Mr. Norman Shaw's design will have great distinction, and will form a dignified example of street architecture. We regret that with it we cannot have a wider street, for the necessarily increased height and the broad scale of the detail lessen the apparent space. In this street of shops we must not, as practical men, ask for a restoration of the Colonnade, which in my youth I can remember as an interesting architectural feature in the Quadrant.

When we look at Nash's work, albeit in stucco, we feel what a much simpler problem he had to deal with than falls to us. With but two storeys of windows above his ground floor, it was easy to make effective spacing, with here a group of columns and there an attic storey or pediment. With increased land values the demand is now for five or six storeys in height and another two in the roof, giving a monotonous repetition of parts. When such new buildings take the place of old in existing streets, there is a proportionate loss of light, and it should be our effort to catch all that is granted us of London's diluted sunlight.

I remember when submitting plans to the late Duke of Westminster, who personally considered all rebuilding schemes on his estate, he made the wise proposal that the south side of the street should be kept lower than the opposite side, to admit sunlight. My building was docked of a storey, but I felt the decision was the result of enlightened legislation.

Leigh Hunt said of Nash that "he found us all brick and left us all plaster." Now the brick and the plaster are disappearing, making way for Portland stone, than which no finer material will be found, with its pearly whiteness, at least on its south and west sides, even in our sooty city. Terra-cotta has been tried and found wanting; its surface cannot resist the insidious combination of sulphur and damp that makes our London atmosphere.

We must not ignore the new material known as "Carrara," a Doulton ware. It shares with terra-cotta the weakness of being a pottery casing filled in with alien matter, but the surface is satisfactory, as seen in several important examples in our streets, it avoids the glitter of most tile surfaces, while the mouldings or modelling upon it are clean and sharp, telling their tale without the coarseness that is sometimes resorted to in making telling features in stone, big rustics, keystones, etc.

Various types may be taken in starting the lines of a really modern house, avoiding both pedantry and mediævalism. I speak of types, for I believe that when the utmost originality is intended, there is, consciously or unconsciously, a reminiscence of something that has been before, and that has left its influence with us. I say this, not forgetting that we have amongst us "l'Art Nouveau"; but in that old forms are resuscitated, chimney-stacks and gate-posts following the obelisk or pylon of Egypt.

Looking at the examples that we may class as "New Art," we find much freshness, with an earnest effort to avoid familiar forms and ways, yet sometimes without rhyme or reason. We have seen architraves to the jambs of windows which, when they get near the top, suddenly cease, leaving the window-head without shelter. Such treatment is original, for it has not been done before; I hope it will not be done again. That which is surprising may be attractive in a sketch or tolerated in a competition drawing, but in a permanent building a freak or surprise, I am sure, should be avoided. This phase is infecting the old world, and I have seen its wildest manifestations in new hotels in old Spanish towns.

There is with us a tendency to exaggerate features—keystones so large that they dominate a building, or stone blockings upon columns that smother the shaft. In spite of such efforts, tradition has still its strong hold: the love for time-honoured buildings, the associations with them, their texture and mellowness, instinctively appeal to us. The client for whom we build dreads seeming startlingly modern with his new house. Instead of feeling a just pride in the creation of his "pleasaunce," he would rather it should seem to belong to the past.

(To be continued.)

Proposed New Works.

Aberystwyth.—A Local Government Board inquiry was held here on the 26th October regarding the application of the Town Council to borrow £3,000 for the erection of 18 houses for the working classes. The Inspector, Mr. Meade King, was urged to secure the sanction of the loan as early as possible, owing to the depression in the local building trade.

Barnsley.—The Town Council has approved plans for the following:—Holden Bros., warehouse off York Street; Wardens of St. John's Church, Institute to St. John's Church; Crookes Trust, additions to premises, 20, Church Street; S. and E. Cowood, 12 dwelling-houses, Blenheim Gardens, off Blenheim Road; George Firth, six dwelling-houses, Denton Street; Leonard Atkinson, alterations to house, Queen's Avenue.

Bedford.—The Town Council have approved plans for the following:—Six houses in Trinity Road, for Mr. R. Jeakings; two houses, Beverley Crescent, for Mr. T. Dickens; ten houses, York Street, for Messrs. Mason and Corbett; seven houses, Denmark Street, for Messrs. Jacobs and Burton; six houses, Trinity Road, for Messrs. C. Melcombe and Son; alterations to premises, 12, Harpur Street, for Mr. W. A. Walker; alterations to premises, 10, Bromham Road, for Messrs. S. Freshwater and Son; and a house in St. Augustine's Road, for Mr. E. Whitmore.

Cambridge.—The Town Council have passed plans for the following:—House, Grange Road Extension, Miss Clover, Girton College; lock-up shop, Mill Road, Mr. J. V. Pryor, Petty Cury; new basement and workshop, Sydney Street, the Cambridge University and Town Gas Light Company, Sidney Street.

Doncaster.—The Governors of the Infirmary have begun to think about the erection of a new building upon a better site.

Eastbourne.—The Town Council have approved plans for the following:—O. C. T. Eagleton, addition to Canfield, Saffrons Road; T. Dunlop, detached house, Kitchenham Road; H. Kent, addition to Bishopsbourne, Carlisle Road; J. McCann, two houses, Milton Road.

Hull.—The City Engineer has been instructed by the Markets Committee to prepare plans and estimates for extending the Cattle Market.

London (Lewisham, S.E.). — The Borough Council has approved plans for the following:—W. J. Scudamore and Sons, Chalcroft Road, five houses; W. Wilkinson, Bexhill Road, twelve houses; Norfolk and Prior, Riseldine Street, twelve houses; Norfolk and Prior, Muirkirk Road, nineteen houses; Weber and Co., Manor Park, four houses; F. E. Wright, Beacon Road, premises at the rear of 211, Hither Green Lane; G. Parker, Champion Park, redrain the school and schoolhouses of St. Michael's Schools.

Rugby.—The Urban Council have decided to erect new public baths in Moat Street, at an estimated cost of £4,500. The swimming pond will be 75ft. by 30ft.

Upton-on-Severn.—The Rural District Council have approved plans by Messrs. Sheppard and Son, of Worcester, for additions to the Isolation Hospital, estimated to cost £1,150.

Watford.—The Urban District Council have passed plans for the following:—Alterations and additions to sanitary accommodation, Park Gate Road School, Herts County Council; two houses, King Edward Road, Mr. Wright; new house, The Avenue, Nascot Estate, Mr. H. Martin; thirteen cottages, Oxhey Road, Mr. Cartwright; new shop fronts, 54, 56, and 58, Market Street, Mr. F. Warren; new stable and motor house, Clarendon Road, Dr. Smith; alterations and additions, Nos. 9, 11, and 13, Water Lane, Mr. Rodwell.

Wellington, Shropshire.—The Urban Council has approved plans for the following:—New buildings in Bridge Road, submitted by Mr. Ensor; shop front in New Street, submitted by Messrs. G. H. York and Co.; and a new bakery, submitted by Mr. Heath.

Correspondence.

Unemployment Assurance for Architects' Assistants.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The suggestion embodied in Mr. Dixon's letter in your issue of the 21st ult. is a matter that was anticipated two winters ago by the Students' Committee of the Society of Architects. A letter was circulated amongst the students of the Society asking several questions; one of which suggested the formation of a section whereby those joining the section were to pay a small sum weekly, and in return to receive about a pound a week when out of employment. This, to be a success required a larger number to participate therein than the Society could muster, although the idea was well received. The proposal was to make arrangements with some insurance company willing to take the matter in hand, but through lack of numbers the matter was for the time being abandoned.

The fact of an architectural assistant's occupation being classed as professional will in no way alleviate the cravings of the inner man, or be a satisfactory substitute for non-payment of rates when such fall due. The stumbling-block has been and is in the fact of possessing sufficient pride (false?) to prevent the disclosure of his need. It is high time that steps be taken in the same direction as Trade Unions, and some method of insuring against bad times be adopted. I have no doubt that the Society of Architects would take the matter in hand if the numbers were sufficient. H. S.

Relations Between Architects & Insurance Surveyors.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In reply to your correspondent's letter appearing in your issue of the 21st October, I would refer him to several of your previous issues, in which you have printed in full the various rules of the fire offices for the different grades of "Standard Fire Resisting Buildings." The discounts applicable vary, but any office will, I believe, gladly give full information to any prospective insurer.

I also annex particulars of rates for some fire insurances in the Cripplegate area.

I have taken first of all, for example, an imaginary building (though many can be found answering in every respect thereto), just south of Jewin Street, and against the items of the rating I have made notes showing approximately how the different extras can be avoided, but full particulars should in all instances be first obtained from the insurance company interested in the risk.

Then I have given an alternative for buildings constructed according to the special requirements of the offices, particulars of which can also be readily obtained on application.

My attention has recently been drawn to a case where the owners had, through their architect, approached the insurance surveyor, and every possible precaution was taken so that a minimum rate was obtained. Shortly afterwards an inquiry was made at the office as to what doors were necessary to lift openings, and on the insurance surveyor going to investigate matters he found that practically the whole of the special construction had been stultified by the erection of a lift through all floors, partially enclosed with match lining!

(1) Ordinary building in Cripplegate area:—

(a) Normal.—Cubical capacity of the warehouse under 100,000 c. ft.
(b) Skylight.
(c) Structural iron work, not covered with brick, plaster or cement at least ¾in. thick.
(d) Walls and ceilings lined with wood, etc., and/or ceilings and soffits not of plaster, lath and plaster, and provided with doors
(e) Floor openings,—Staircases enclosed with to all openings, are allowed.
(f) Exposure to neighbouring buildings.
(g) Tenants—more than one, not more than four.
(h) Trade processes—by power.
(i) Block extra.

The rate for a building of this description is 29s. per cent., but the additional for items "c," "d," and "e" are easily obviated. This would reduce the rate by 2s. 6d. per cent.

(2) If the building were constructed under the special requirements of the fire office, the rate for the structure would be reduced by 5s. per cent., in addition to the 2s. 6d. above-mentioned, and that for the contents by 3s. 4d. per cent., also in addition to the 2s. 6d.

Besides which, if the premises are fitted with approved fire-extinguishing appliances, discounts ranging from 20 per cent. to 50 per cent. can be obtained.

AUDI ALTERAM PARTEM.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Referring to the letter signed "The Man Who Pays" in your issue of the 21st October, if the writer of that letter will apply to any tariff fire insurance company (or to their surveyor) he would be furnished with half-a-dozen or more schedules showing the mode of construction of fire-resisting buildings necessary to ensure various reductions in the rate of premium. I think he will find they even apply to a Manchester warehouse in the Cripplegate district.

A recent case occurred in which a well-known architect consulted a fire office, and with the aid of their surveyor was enabled to erect a large building, that, when completed and stocked, was rated at more than 50 per cent. below the rate for a normal building in the like occupation.

I have had some experience, and have usually found that architects are simply prepared to discuss the necessity for the construction asked for by the office, and to assert their opinion of the inutility of the office requirements.

Their surveyor, however, is acting under the instructions of the combined offices, whose requisitions have been elaborated, after long and careful consideration, guided by statistics and conclusions drawn from many years' experience of the result of fires.

The greatest obstacle to the carrying out of some of the office regulations for the erection of fire-resisting buildings is undoubtedly the building by-laws in town and country. Were these modified

in the direction indicated by insurance companies, especially in the case of reinforced concrete structures, money might be saved in construction and in the cost of insurance.

London. R. A. W.

"DETAILS," a weekly journal for all interested in architecture and the allied arts, of which the first issue is announced for December 3rd, has for its essential aim, the prospectus states, the provision of examples of good work in which the practising architect will take a keen interest. The paper will consist entirely of illustrations, which will be made from specially-taken photographs, reproduced to a large size, and accompanied in every case by measured or scaled drawings, and by such particulars as appear to be necessary or interesting. The scheme is not confined to any phase or period, and will embrace all the arts and crafts allied to architecture. Examples of modern work of all countries, as well as examples of old work, are to be given. The best possible style of production is promised—fine printing on art paper, and the price is to be twopence weekly. The editorial and publishing offices are at 392, Strand, London.

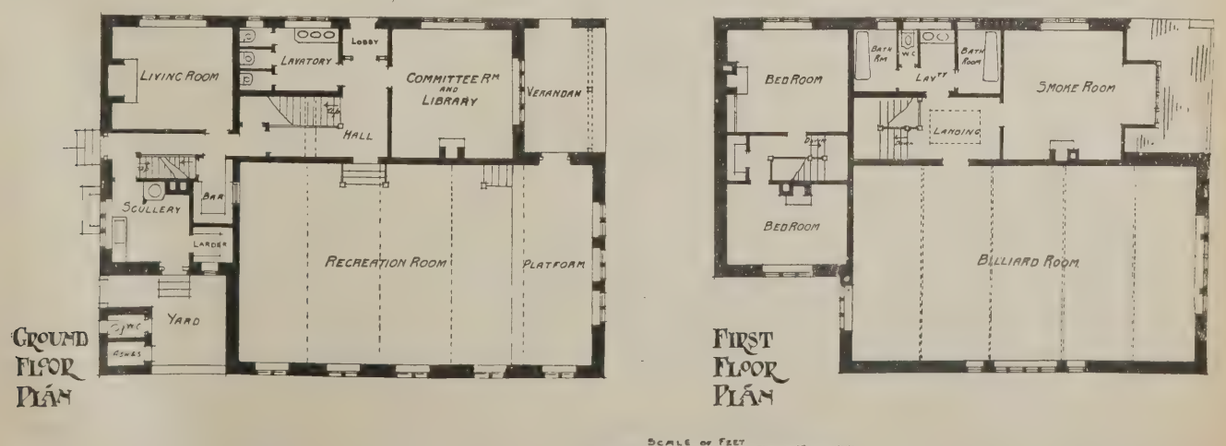
* * *

MESSRS. FARADAY AND SON have removed their show-rooms for electric-light fittings to more commodious premises at 146-150, Wardour Street, W., 200 yards south of their old premises in Berner Street.

* * *

The Edwardian chimney-pot (Mark Fawcett's patent), we are informed, has been fixed on several Royal palaces, and is also a feature on the skyline of blocks of artisans' dwellings erected for the Sutton Trust. Truly a wide range of utility!

Our Plate.



We illustrate this week two recent works by Messrs. Walsh and Nicholas, F.R.I.B.A., of Halifax.

House at Rishworth.—This house has been erected for Mr. D. G. Wheelwright, at Rishworth, in the Ryburn Valley, one of the most picturesque spots in the West Riding, and is at the foot of the easterly slope of the Pennine Range. It is built of local millstone grit, walled in random courses, and the roofs are covered with local "self-faced" stone slates. As far as possible, stones having natural iron-stained faces, have been used, with the object of getting as much variation in colour as possible; the windows are leaded lights in metal casements. The work has been carried out by local contractors under the separate trades.

Club and Institute Bailiffe Bridge, Yorks.—This building has been erected near the carpet works belonging to Messrs. T. F. Firth and Sons, Ltd., by the senior director of the firm, Mr. Thos. F. Firth, conjointly with his eldest son, Mr. Algernon F. Firth, in commemoration of the latter's silver wedding. The building is to be for the use of the people of the village. Externally, the structure is entirely of natural faced local "delf wall-stones," from the Elland Flagstone formation. These are walled in random block courses, the natural faces being of varying shades of red, caused by the deposit of iron. The roofs are covered with natural "self-faced" local stone slates. The windows are of plain leaded glass in steel casements. The building is so planned that the ground and first floors may be used either together or separately, there being a secondary entrance to the recreation room without passing through the chief entrance, so that public lectures or meetings will not interfere with the privacy of the members. The floor of the recreation room has a slight spring, so as to be suitable either for gymnastics, dances, concerts, or ordinary meetings. The heating is by low-pressure hot-water radiators, and a cast iron sectional boiler. The work has been carried out under separate contracts for each trade, with the superintendence of the firm's clerk of works.

R.I.B.A. MEETINGS.

The R.I.B.A. list of ordinary meetings, to be held at 9, Conduit Street, Hanover Square, London, W., on alternate Monday evenings, at 8 p.m., includes the following items:—November 16: "The Elizabethan House as Illustrated by Contemporary Architectural Drawings," by J. Alfred Gotch, F.R.I.B.A., F.S.A. December 14, "The Elements of Design in Internal Decoration," by T. R. Spence. January 18, 1909, "Public Abattoirs," by R. Stephen Ayling, F.R.I.B.A., and award of prizes and studentships. February 1, President's address to students, and presentation of prizes. February 15, "Town and Country: Some Aspects of Town Planning," by H. V. Lanchester, F.R.I.B.A. March 15, "American Architecture," by Francis S. Swales. March 29, "Buildings for Higher Technical Education," by Sir Aston Webb, F.R.I.B.A., R.A. April 19, "The Architectural Work of the London County Council," by W. E. Riley, F.R.I.B.A., Superintending Architect of Metropolitan Buildings, and Architect of the London County Council. May 17, "Smoke Abatement," by Sir W. B. Richmond, K.C.B., R.A. (Hon. A.R.I.B.A.). June 21, Presentation of the Royal Gold Medal.

CLUB AND INSTITUTE, BAILIFFE BRIDGE, YORKSHIRE. WALSH & NICHOLAS. ARCHITECTS. *(See Centre Plate.*

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible.
The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.
The querist's name and address must always be given, not necessarily for publication.

SPECIAL NOTICE TO ENQUIRERS.

Answers by Post.

We are constantly receiving enquiries to which an immediate reply is requested and with which stamped addressed envelopes are often enclosed. Under our present rules it is impossible to comply with this request, and the immense number of enquiries received, and the exigencies of space often prevent us from publishing the replies as speedily as we should like, or in time to be of value to our correspondents. To meet this difficulty we have decided to open a department for "Answers by post." Correspondents desiring an immediate reply must enclose with their enquiries a stamped addressed envelope and a postal order for 1s., made payable to Technical Journals, Ltd., and crossed. Enquiries should be addressed to "Answers by post" Department, Builders' Journal, Caxton House, Westminster. We reserve the right to publish any of these enquiries that may be of general interest; and we reserve our right to return any enquiry and remittance where the request is for a design or for information on some elementary matter of building construction which should be within the knowledge of the enquirer. It need hardly be added that the fee to be paid for immediate replies does not pay for our experts' opinions, or for the special arrangements now required to deal with these enquiries. It is solely a protection against the receipt of innumerable questions of no particular interest or urgency.

Other enquiries will be answered, as heretofore, in the "Enquiries answered" columns of the Journal.

Ascertaining Cubical Contents of Plot of Land.

SCARBOROUGH. — "TENNIS LAWN" writes: "What is the simplest, accurate method of calculating the cubical contents of the piece of land to be excavated, as shown upon the enclosed tracing? (not reproduced). The piece of land to be excavated is bounded on the upper surface by the letters A B D and E, and on the lower surface by G C D E."

Calculate the areas of the vertical cross sections at D F H and at E; divide their sum by two; and multiply this by the length E F, plus half the horizontal equivalent of the slope at F.

F. S. I.

Delivery of Building Materials.

SURREY.—"A. B." writes: "A agrees to deliver a large amount of building materials to a certain building. B agrees to fix the same, the materials to be delivered on site free of cost. Who is liable for the cost of unloading? A claims that delivery on site does not include unloading; B says it does, and that it is not his business to provide men for the purpose. Please advise."

A having agreed to deliver the building materials "on the site," must, of course, unload them in a reasonable way, but he is not liable for placing them precisely upon the spot where they are required, nor for elevating them to the scaffold, etc. Would it not be well for each party to provide a man for the unloading? F. S. I.

Construction of Tennis Courts.

HINCKLEY.—"TENNIS" writes: "Please give particulars of tennis courts constructed of gravel or granite."

The whole secret of making a tennis court of gravel is to take care that the drainage is good, in order that these courts may be played upon in damp weather, and when it is impossible to use a grass court. I suggest that a layer of 3in. or 4in. of granite broken to pass in all directions through a 2in. ring be laid as a foundation, and that fine granite gravel be used to fill in the interstices, and laid to a depth of, say, an inch on top; use the softer kind of granite, which will bind on rolling, rather than the very hard varieties.

F. S. I.

Verandah Disapproved by Local Authorities

LONDON, S.E.—"LEICESTER" writes: "(1) Is there any by-law against the erection of a verandah above windows as shown upon the accompanying plans and section (not reproduced)? (2) The borough surveyor orders that the verandah shall be pulled down (it has only just been erected). What should the owner do in the matter?"

(1) It appears to me to be a little doubtful whether the verandah in question is of sufficient importance to warrant any interference by the borough surveyor; but it also appears to be perfectly clear that it is not enumerated amongst the exempted buildings to which the by-laws do not apply. I fear, therefore, that if it be insisted upon, you will not be able to resist an order for its removal. (2) I should await events, and do nothing. It is probable that nothing further will transspire. F. S. I.

Street Naming.

LONDON, S.W.—"FAIR PLAY" writes: "A building owner having some private houses in the centre of a long main road is converting them into shops. Can he name his row of shops as a terrace or parade in that road without any reference to the local urban district council? The local council, on being asked permission, begin to dictate and assume authority which possibly they do not possess. Has an urban district council power to administer the Towns Improvement Clauses Act of 1847?"

There is nothing to prevent an owner naming his property as he chooses, without any reference to the local sanitary authority. It is usual, however, to name a new street at the time of submitting the drawings for it, for approval. The Towns Improvement Clauses Act of 1847 is now incorporated with the "Public Health Acts," and can be administered by an urban district council, so far as it applies to them. F. S. I.

Damage from Settlement of Building.

BOLTON.—"R. H. C." writes: "During certain constructional alterations to the ground floor of a three-storey building, a number of cracks have appeared in the walls of the upper rooms, showing that a certain amount of settlement has taken place. A number of rooms consequently require redecorating. Is not the contractor responsible for this? The usual clause with respect to damage to existing buildings, etc., is in the bill of quantities, to be made good at contractor's expense. The form of contract is the R.I.B.A."

I am of opinion that the building contractor is not legally liable for the damage you mention as arising out of the recent operations, unless it has been caused by neglect or carelessness on his part. F. S. I.

A Question of Water Supply.

ASHBY-DE-LA-ZOUCH.—"DELA" writes: "A village is dependent for its water supply on a spring conveyed through pipes. The owner of the land and of almost all the village proposes to divert the supply at a high level and use it for milk cooling. During this process, the village would probably be derived of its entire supply. Failing a legal remedy as to the diversion, could the owner be compelled to provide fresh supply?"

In the absence of any deed or legal agreement to the contrary, the owner may certainly divert the water from the trough entirely, or may modify it as he chooses, whether the property which it supplies belongs to himself or to others. The reason for this is to be found in the fact that the pipes form an "artificial" channel, and the water is not flowing in a "natural" course. The district council have no powers to compel a landowner to provide a new water supply to existing houses (though they have such powers with regard to newly-erected houses); but if by reason of the absence of water a "nuisance" arises which can be dealt with under the "Public Health Acts," they may call for that nuisance to be abated. F. S. I.

Bad Case of Dry Rot.

ASHBY-DE-LA-ZOUCH.—"DELA" writes: "Dry rot having infested some boarded floors, the boards were taken up and woodblocks were substituted. These blocks have gradually risen ⅛in., and there is fungous growth behind the architrave of a door. What is the best method of dealing with the difficulty?"

The fungoid growth is no doubt caused by damp, and unless that cause can be removed, the trouble will continue. Are the walls provided with proper damp courses, and has the building sound rainwater spouting? The boarded floor should be supplied with air underneath the boards. F. S. I.

Meaning of Finishing Two Tints.

NEWPORT, MON.—A. writes: "I have a painting specification of which the wording is as follows:—Knot, stop, and paint four coats, and finish two tints. I shall be glad if you will kindly say in your next issue how many coats of paint the architect can compel me to put on under this specification?"

Four coats. The clause seems perfectly clear. Presuming that the work is new, you will prime (1st coat), knot and stop, and then give three more coats, which will make the four coats specified. "Finish two tints" simply means that the last coat is not to be in one colour, but in two. For example, the doors would be finished in one colour for the stiles, muntins, and rails, and another colour in the panels. As a rule, these colours are mixed to match, or at least, harmonize with the wall paper, Three coats having been given, including the priming, it is only necessary to mix two batches of colour for the final coat, so that no part of the work receives more than the four coats. J.

CONCRETE AND STEEL SECTION.

(MONTHLY.)

REINFORCED CONCRETE PILE-MAKING AND DRIVING.

By Vere Sussex Hyde.

One of the most interesting subjects in the construction of reinforced or armoured concrete is piling, which has for the past seven or eight years been extensively used in this country in cases of bad foundations and for pier and jetty work. The writer proposes in this article to deal with the practical side only of making and driving ferro-concrete piles, and he trusts that this may be of a little assistance to those who have the supervision of this work while in progress.

Framing the Skeleton.

The first thing to be done is to make the steel skeleton framework. For this purpose it is necessary to take out from the rods (which have already been sorted out on the works) any bends, curves, or twists; but this must be done without heating. When this is done, the wire-workers should be set to frame up the skeleton, adhering strictly to the engineer's drawings detailing the manner of the reinforcement. While this is in progress, the joiners should be set off to prepare the necessary number of moulds, which should be constructed of good dry straight timber, not less than 1½ins. to 2ins. in thickness, wrought on the inside face, and properly and securely braced where necessary.

The Moulds Required.

Some systems advocate the use of a square pile, and others a round. The mould required for a square pile is a very simple matter constructed with three sides, the uppermost side being left open for placing in the steel skeleton and concreting. It is essential, however, that the mould should lie perfectly level, and that the skeleton be securely suspended in the correct position, and dead level, so that it may be entirely surrounded by concrete. The ends of the rods must be properly placed in the cast-iron shoe at the end of the mould.

For a round pile, a mould is constructed with two circular sides or cheeks made with narrow battens, after the fashion of a barrel bound with straps, with two flat sides; so that when the pile is complete, it has two flat surfaces, wide enough to lay flat up against the leaders of the piling frame to facilitate the driving.

In forming this mould, a straight plank is used, through which bolts are passed about 2ft. apart, for the purpose of holding down the straps that bind the circular sides. This plank is laid down dead level on sleepers. The skeleton frame is next laid on this plank, and then the circular sides or cheeks are attached and bolted through the straps at the top, as shown in the sketch. The open space at the top is of the same width as the bottom flat plank. The opening is left for the concreting. (See Figs. 1, 2, and 3.)

As in the case of the square pile, the skeleton framework is suspended by hooks to the top bolts to keep it in the correct position; the hooks being removed when the concrete is half-way up the mould, so that there is no chance of the steel framework getting disturbed from its correct position.

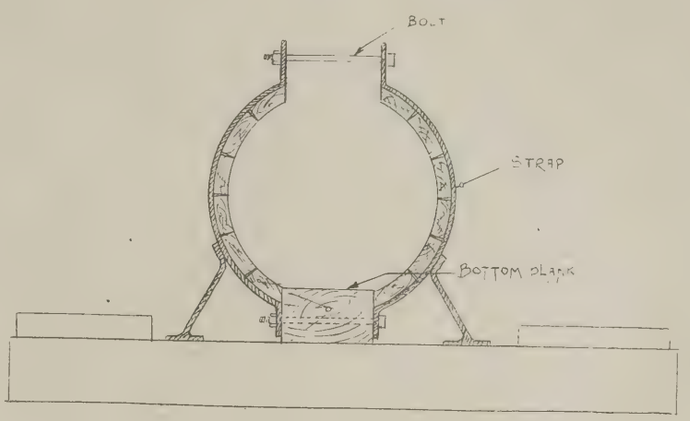


FIG. 1

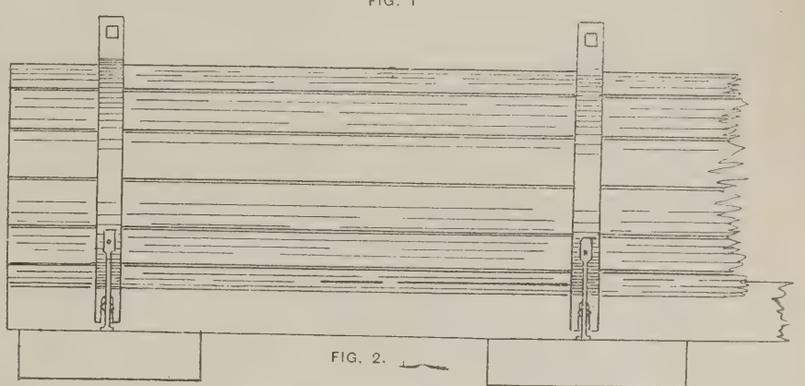

FIG. 2.

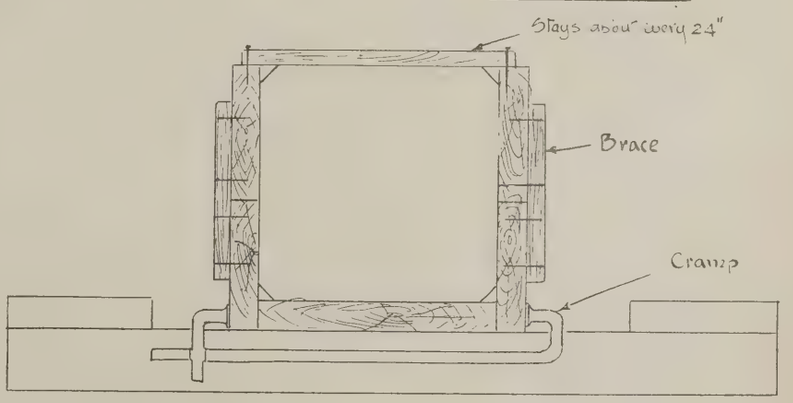

FIG. 3.

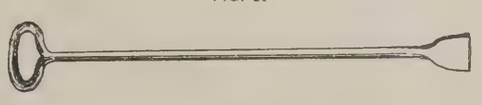

FIG. 4.

Concreting the Piles.

For the concreting of piles, it is advisable to use a suitable rammer with rounded shoulders, about 1½ins. to 1¾ins. in breadth at the base (see Fig. 4), and not in the form of a golf club, as with the latter there is a tendency to catch the reinforcement, which is generally of a close form in ferro-concrete piles. The ramming or punning must be very thoroughly performed; and keen supervision should be exercised, so that when the concreting is completed, the whole is a compact monolithic and non-porous mass. In ordinary circumstances, the moulds may be removed in four or five days after concreting. In hot weather, it is a good practice to water the piles

with an ordinary water-pot and rose daily, for about a week or ten days, say, ten hours after the concreting has been completed. A well-made pile may be safely driven seven weeks after making; but, for obvious reasons, the longer it is permitted to remain undisturbed, the better. In practice, the following specification for concrete to be used for pile-making will be found a good one: 27 cube ft. of good Thames or river ballast, entirely free from all loam or blue clay, and in no case larger than that which will pass ¾in. mesh; 13½ cube ft. of clean sharp sand, free from salt and other impurities, the grains to be of various sizes; 7¼ cwts. of high-grade cement of the British Standard specifications. The concrete mixture, if properly mixed and rammed, will make up a volume of 31 cube ft.

The writer has found that, in cases where a wooden dolly alone is used, without a cast-iron helmet, for pile driving, it is advisable to strengthen further the head of a pile for about 2ft. down with a stronger mixture than before mentioned; the aggregate for this purpose to be composed of 2 parts of granite chippings, free from all granite dust and washed, and not larger than that which will pass a ½in. ring; 1 part of clean sand, as before, and 1 of cement, making a concrete of 2—1—1, otherwise 3 to 1 concrete. Concrete thus proportioned sets like rock, and will not be damaged by driving when no helmet and cushion is used.

Driving the Piles.

Reinforced concrete piles are driven with a special pile-driving machine or engine, among the best known being the Lecours, Sykes, and Lidgerwood. These drivers are generally fitted with a 2-ton monkey or ram, which is hoisted by a steam winch. The ram can be driven at various speeds up to thirty blows a minute, and may be, if necessary, regulated and pulled up in its fall. Care and judgment must be used to drive with steady uniform blows, with a short drop, otherwise damage may be done by splintering or cracking the pile-head, however good or hard the concrete may be. But with a trustworthy gauger driver, who will exercise care, piles may be driven without a crack. Owing to the great weight of a long pile, say, 35ft. to 45ft. in length, special arrangements should be made for careful handling, hoisting, and placing in position for driving. When a pile has been hoisted to its position, it must be plumbed up, then bolted on, or rather through, the two leaders of the piling-frame, and then plumbed up again, before any blows are given.

In a case where a cast-iron helmet is used, it is necessary to make a strong cushion of sawdust in sackcloth, and to pack it inside the helmet, to relieve the head of the pile from the severe impact caused by the fall of the ram, thus saving the head of the pile from shattering, or being otherwise severely damaged. When a helmet is not specified for driving, an elm block or dolly, about 3ft. high, should be placed on the head of the pile.

Testing the Pile.

Everything being ready, the pile-driver proceeds with the driving (which may be regulated as the case necessitates), and drives until the specified set is reached; the set or test to be as stated in the engineer's or architect's specification. The usual test is that the pile does not sink more than ½in. or ¼in. under ten blows of a 2-ton monkey at a drop of 3ft. The test is, of course, always regulated according to the conditions of the soil, and the kinds of strata through which the pile has to penetrate.

The testing of a ferro-concrete pile is obviously one of the most important points to be considered during the execution of works on which piles are being driven, and one which is open to much abuse. The writer desires to take this opportunity of pointing out a few necessary precautions, when taking the set of a pile, and thus illustrating how a set or test can be "faked" and generally juggled with.

For measuring the test, it is necessary that the distance should be determined for the drop of the monkey or ram to the head of the pile. This should be clearly marked on the driving frame, so that it can be seen that the ram is hoisted to the right height for each blow. For marking the pile, a gauge rod is hung from the leaders of the piling-frame, so that it may swing. A line is drawn with a pencil on the pile at the level reached by the bottom of the gauge. The specified number of blows is then given, and the pile is again marked with a pencil, with the aid of the gauge. The space between the two lines thus marked on the pile determines its going after receiving the blows.

Points in Testing.

It is necessary for the clerk of works or inspector, when called upon to witness and pass a test, to observe very minutely the following points:—

(a) To note that when a helmet is used for capping a pile, the sawdust cushion is the same one that has been used in the driving, and that another has not been substituted, or that a new one has not been packed into the helmet and the old one placed under it, so that on looking up into the helmet the Instructor sees the old cushion apparently undisturbed. This little ruse has come under the writer's notice on several occasions. It is quite obvious that under these conditions a pile does not get the full benefit of the blow.

(b) To see that the ram is raised each time to the height marked on the piling-frame, and that the men holding the ropes do not regulate the fall of the ram so that it loses its force just before striking the head of the pile. He should take the precaution of putting the ordinary measuring rule over the gauge rod used for marking the fall of the ram. The writer has known this gauge to be secretly shortened an inch or two unobserved after being passed as correct, the idea being that, having once been passed, it would not be measured again.

(c) Another very 'cute device that has also come under the writer's notice is that, when drawing the lines on the pile with the aid of the gauge, the pencil is held at an angle from the latter, instead of at right angles, thus drawing the lines closer together; the only remedy for this is for the clerk of works or inspector to insist on marking the piles himself.

(d) When pile-driving is being carried on at night, a very keen look-out must be kept to see that the pile shoes are not tampered with or knocked off preparatory to lowering them into position for driving.

Piles are, as a rule, placed in groups of two, four, or six, at the points where the weight has to be supported. It will occasionally be found that, in driving, the first pile of a group may be driven right into the ground and then will not take the set, going always, say, 1-16in. to ¼in. more than allowed. In such an instance the following method may be employed to get it to pass the test—namely, to stop driving the pile, and drive the one next to it, then return to the former pile next day, and to give it 120 blows with a 3ft. drop before applying the test. In the majority of cases, the pile will not, under these circumstances, go more than 1-16in., and probably not that. This would probably satisfy most engineers.

THE SUPERVISION OF CONCRETE.

By a Clerk of Works.

Architects and engineers have recognised the importance of the good quality of the concrete used, and stringent specifications are often met with dealing with the class of matrix and aggregate to be used, and the proportions in which these are to be gauged, etc., and clerks of works, who really are the inspectors of the quality used, are bound to be particular in their supervision under such conditions; and, in fact, it is not uncommon for contractors to complain that some clerks of works are more exacting in their requirements than the specification warrants; too often because the clerk of works is young and inexperienced, and hopes to please the architect by a show of zeal.

No matter whether the clerk of works or inspector is old or young, experienced or inexperienced, crabbed in temper or gentle in manner, there is no doubt whatever that one of the most important items requiring constant supervision is concrete: no matter what position it is to occupy in the work. And there is no doubt either that an incomplete or faulty specification for concrete work is a curse to the contractor and the architect alike, as it gives opportunities to the unscrupulous contractor to scamp his work, and affords an exacting and bad-tempered clerk of the works unnecessary opportunities to worry a conscientious builder.

A word first, therefore, on the materials forming the concrete. Of these there are two distinct parts—the matrix and the aggregate. If the matrix, or cementing material, is specified of standard quality, it is all that can be desired. As regards the aggregate materials, the specification should be exact as to their requirements. The following clauses from a specification would enable a clerk of works to be perfectly certain that he was getting out of the builder all that the architect desires:—

"The whole of the cement used on the works shall be the best highly burnt pure Portland cement of a uniform dark-grey colour, and free from lime, slag, dust, or foreign material after leaving the kiln; it shall in all cases not weigh less than 112lbs. per imperial (striked) bushel when poured in quietly, and shall be obtained from some manufacturer approved by the architect."

"The cement shall be gauged extremely fine, and so that 08 per cent. at least will pass through a sieve of 5,876 meshes to the sq. in."

"The cement will be gauged neat, with from 17 per cent. to 15 per cent. of

its own weight of water, and shall be capable of sustaining a tensile stress of 400lbs. per sq. in. of sectional area, eight days after having been made in a mould and immersed in water during an interval of 7 days. At the expiration of 28 days, the briquettes shall have shown a steady increase of bearing a tensile stress of 580lbs. per sq. in., having been immersed in water during the last 27 days."

"The concrete will further be tested along with the sand to be used in the work. It will be gauged with three times its weight of clean dry sharp sand, which has passed through a sieve of 400, and been retained on one of 900 meshes to the sq. in."

"The cement and sand having been well mixed dry, about 10 per cent. of their weight of water is to be added, and the briquettes formed in the moulds. The briquettes having in the meantime been kept in a damp atmosphere, are to be put in water 24 hours after having been made, and will remain in water for a period of 28 days from the time of gauging, when they will require to stand a tensile strain of not less than 180lbs. to the sq. in."

"In addition to these tests, the cement shall, when subjected to a chemical test, yield a satisfactory result, and shall have a specific gravity of 3.1."

"The contractor shall provide at some convenient part of the site a suitable shed, or other approved building, having a damp-proof floor, with all necessary subdivisions, so that each consignment may be kept separate, of sufficient size to contain such quantity as the architect or clerk of works may order to be kept in store."

"All cement before being used shall be spread upon this floor in a layer not exceeding 12ins. in thickness, and allowed to remain at least 14 days, or for a longer period if the condition of the cement requires it, the contents of the various bags or casks being thoroughly mixed with each other in spreading out on the floor, and the cement shall be turned over from time to time as the clerk of works may direct."

"The builder shall take precautions to keep all cement dry, and shall provide all necessary waterproof sheeting or tarpaulins for the protection of the same on the works."

"The builder shall always keep sufficient stock for 14 days' requirements at least, and with each delivery of cement he shall furnish the architect or clerk of works, in writing, the quantity sent in, the maker's name, date when taken from the kiln, and samples taken from the consignment, in the presence of the representative of the architect, for testing purposes, and deliver the same at the office of the latter, properly marked and labelled."

"The cement will be tested by the architect, and all that fails to comply with the above standard of strength will be rejected, and must forthwith be removed from the site at the expense of the builder, and an average of three briquettes shall be considered conclusive. No cement to be used until after being tested."

"The first consignment of cement to be put in store immediately after the signing of the contract, for the purpose of testing in accordance with the terms of this specification, and the architect and his clerk of works shall have free access to the store at all times, and shall be at liberty to take samples of cement when they may desire."

The clauses given above are almost as severe as it is possible to make them, but to no one of them could an honest builder take exception. They have been framed to ensure as near perfection as is possible, and such explicit particulars define exactly what is required of the clerk of works, equally as it does of the builder.

It is possible to criticise even such a model specification as the above, but this is stringent enough for all ordinary work. In works of very great magnitude it would be desirable to settle the supply of the cement on a separate specification, and this, in fact, is the usual course.

Without reproducing the clauses that govern the supply of the materials forming the aggregate and the making of the same into concrete, it will be seen from those given for the Portland cement that, by carefully describing in detail all the requirements of the materials, the clerk of works will be assisted to a large extent in his work of supervision.

If the specification is vague on the point of the materials, and the clerk of works is to be the arbiter of the quality of those supplied, it is not at all unlikely that grave injustice may be done to the contractor, or that some very peculiar substances may be brought on the site for aggregate. A few weeks ago, the writer, visiting a job in London, arrived in time to see four yard-cart loads of old pantiles brought to the site as aggregate for concrete. The contractor evidently had some buildings to demolish close by, and rather than cart them away to a tip, had the hope of utilising them on his neighbouring jog for the purpose mentioned. They were black with age, covered with soot, moss, and even small fibrous roots. The only point in their favour for the purpose the builder had in view was their hardness, but otherwise their dirty condition and sameness of shape (even when broken up to pass the specified gauge) was sufficient reason to reject them out of hand. Old drain pipes, slimy when wetted; old bricks, previously used for flues and coated thickly with soot; and old concrete, made originally of weak lime, and now crumbling at the touch, are some of the materials brought forward as substitutes for good ballast, etc., and if the clerk of works is inexperienced, and the specification weak or vague, such materials may find their way into the new work, to the detriment of its stability.

No matter how exactly a specification is written concerning the materials, inferior concrete may result owing to bad workmanship in the making, mixing, depositing, ramming, etc., all of which faults could be avoided with proper care and supervision.

One of the most important points is the proper proportioning of the ingredients. The particular proportions should be defined in the specification, and for this purpose proper gauging or measuring-boxes must be brought into use. The capacity of the one for measuring the cement will be proportional to the volume of the aggregate to be used, and is best made with a bottom to it, so that the cement may be placed on top of the aggregate after measurement. That the boxes are of the correct capacities the clerk of works will have beforehand determined for himself. The supervision of concrete must be constant, for which reason the mixing should take place in full view from the window of the clerk of works' office; if this is impossible, the clerk of works must be always outside whilst the mixing is in hand. And at this time the hours of the clerk of works should be those of the workmen. The boxes should be filled; an inch too much of the large box and an inch too little of the small one will make all the difference between a good or a bad gauge, and must be avoided. A common dodge of foremen is to have the aggregate stored around the mixing platform, and if the latter is only just sufficient to hold the whole contents of the gauge, in mixing and turning over, the gauged part frequently comes perilously near the ungauged portion, and unless the clerk of works keeps a close look-out, shovelfuls of the latter will be added to the former, to the loss of the true proportions as specified. This the clerk of works can remedy or avoid by seeing that a clear space is left all round the platform, or if the site is too cramped to allow this, then scaffold-boards or running planks can be stood on edge to separate the two classes of materials. The mixing platform is easily formed of scaffold or similar boards of the same thickness.

In addition to the exact proportioning of the materials, the mixing itself requires close supervision. The platform should be well stiff-broomed prior to receiving the first of the ingredients, at each gauging, to free it from all loose dust, dirt, or soot. The aggregate should be watered if it is composed of broken brick or stone or similar porous substances, to avoid their soaking up the water required proper to the mixing. When one gauge has been brought to the platform, it must be turned over at least twice a day, before any water is given, which last should be added through the rose of a hose-pipe, or, if a large supply tank is near at hand, a watering-can with rose may be used, but there is always a risk of the "turners-over" continuing their work whilst the can is being replenished, so that some parts do not receive their proper share of water; on the other hand, if a hose-pipe is used, it must have a "waste-not" cock at the rose end to allow of the man manipulating it checking or stopping the supply to avoid saturating and drowning the mixture. The turning over whilst wetting forms the third turning; it should be turned over at least once more before being wheeled away to be deposited—twice for preference.

If the size of the job warrants it, a mechanical mixer can be used, which gives good results, and on large works the concrete produced is considerably cheaper in cost per cubic yard. The clerk of works still has to see that it is accurately gauged, etc.

Prior to depositing, if the work is to be in trenches, the clerk of works is bound to see that the excavations are of the correct width and depth, and that a sufficiently good and level bottom is obtained, and that the trenches are free from water, mud, etc. If the trenches have been got out too wide, the extra width must be made up with concrete, and in no case must the proper width be kept by boarding, to be taken away as the concreting proceeds, nor must the void be filled with returned earth. If the concrete is to be deposited inside moulds, sheeting, etc., these must be inspected to see that no shavings, dirt, dust, or blocks of wood, etc., have been left in the same, which would occupy space that should be filled with concrete.

Experience has shown that no advantage is obtained by tipping concrete from a height to the level it is to occupy; at one time it was thought to consolidate

it, but it is now seen to separate the particles forming the mass, in falling, which is to be avoided. The concrete, after mixing, should be rapidly filled into barrows, wheeled to the side of the trench, etc., and gently lowered into position. It should then be punned, care being taken that this is not overdone; the time to cease in this work is when the cement-laden water rises to the top. If the concrete is to form reinforced columns, etc., care must be taken in the ramming to avoid shifting or moving of the steel rods. When once the cement has commenced to set, punning must cease, and in the case of quick-setting cements it is advisable to dispense with the punning altogether.

In deep trenches, etc., the concrete is best laid in truly horizontal layers of about one foot to 18 inches in depth, which are rammed and allowed to set before another layer is added. For the surface of the layers not to be level is to form a means of escape for the cement, as it will be carried away with the running water on the top. Each surface should be well brushed before the next layer is added, to remove loose dust, etc. In order to form a key on the lower bed, to receive the upper one, the former can be gently pickaxed to roughen its surface as left by the punners. The lower bed should also be wetted prior to depositing on it the succeeding layer.

The depositing requires care, as to tip from the barrow carelessly into the trench often results in the freshly made concrete striking the sides of the trenches, which, in addition to covering it with soil or earth, and thereby spoiling its strength and setting powers, etc., and entailing loss of time in removing such damaged concrete, besides the loss of the concrete itself, there is also the cost of re-preparing the trench afresh by removing the fallen earth, and the making good the vacancy on the sides of the trench with concrete.

The time of the year and state of the weather must guide the clerk of works as to the advisability of proceeding with the concrete, or leaving it in abeyance for a time, until more favourable conditions prevail. Frost will damage the solidity of the resulting mass and retard the setting. Heavy rains will probably help to drown the cement if occurring whilst mixing, washing it completely off the mixture and from the platform, leaving insufficient to form a good cementitious material. It is hardly necessary to insist that once concrete has commenced to set, ramming must cease; also no clerk of works should allow concrete once mixed and left for a time to be knocked up again, with addition possibly of more water, as the setting power and final strength of the knocked-up concrete is much lower.

LIVERPOOL ARCHITECTURAL SOCIETY.

The annual report of this society for the official year 1907-8 shows that the membership consists of fifty-six Fellows and sixty-nine Associates—total, 125. Improved financial conditions have enabled the council to increase slightly the expenditure upon the library and for students' prizes, and to make a donation to the Architects' Benevolent Society. The President of the Liverpool Society, which is now in its sixtieth session, is Mr. T. E. Eccles, F.R.I.B.A.; Mr. E. P. Hinde, A.R.I.B.A., and Mr. C. H. Reilly, M.A., A.R.I.B.A., being vice-presidents; while the honorary secretaries are Mr. Gilbert W. Fraser, A.R.I.B.A., and Mr. Ernest C. Aldridge.

REINFORCED CONCRETE AND INSURANCE RATES.

One of the first considerations in every prospective building is the rate of insurance which the owners will be called upon to pay when the building is completed. It is the attitude of the insurance companies on this question that to some extent causes a hindrance to building operations at the present time. Various methods of making buildings more or less fireproof have been adopted by the architects on the suggestion of the insurance surveyor, but too often these suggestions, when adopted, though making for an increase in the cost of the building, and in the fire safety thereof, have not resulted in a reduction in the rate per cent. charged by the insurance company. Valuable work in the direction has been done by the Fire Prevention Committee, who claim that through their efforts, and by the adoption of their regulations, millions of pounds worth of damage by fire have been saved.

This, however, is hardly sufficient in the interest of the ordinary commercial man, for though the avoidance by fire is to be greatly desired, he would be the more pleased if, in addition, it were possible to reduce his insurance cost. As an illustration, assuming a printer's risk to be taken, although the owner of a building may adopt all possible methods of fire prevention, yet, despite the consequent increase in the cost of his building, he still has to pay an enormous insurance rate, varying from 10s. to 21s. per cent. or more. The rate applies not only to the particular building in question, but to adjacent buildings also. Obviously, this must militate against building operations, because the owner, when considering the details of the prospective building, naturally asks himself what modern fireproof invention is likely to benefit him over and above the avoidance of dislocation to his trade consequent upon a fire; and practically the only answer is that he gets no benefit. The natural result follows that he must give up his idea of building, or content himself with a type of building which is not the best from a fire-risk view.

To this selfish attitude of the insurance ring, the builders owe much of the depression in their trade, and it behoves the various associations of one kind and another connected with the trade to see how far their efforts might be successful in bringing about a more intelligent attitude on the part of the insurance companies towards the question. The word "intelligent" is used advisedly, because it can scarcely be described as intelligent to prescribe a rate calculated to act as a deterrent upon buildings of a high-class character. Though a reduced rate would perhaps decrease premium receipts to some extent, yet it must necessarily increase insurance profits, if thereby prospective builders are induced to erect high-grade fire-resisting structures, which make burn-outs practically impossible.

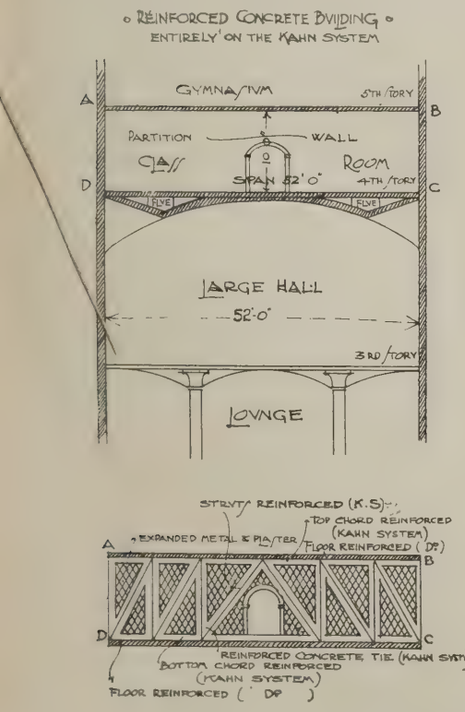
The advance in reinforced concrete, as seen in the last few years, affords proof of the readiness of builders to adopt progressive methods, despite the lack of encouragement referred to; but it is beyond doubt that the advance, rapid as it may have been, is small when compared with the progress consequent upon any tariff preference given by insurance companies to constructions of this kind.

The argument so often used against such preference is the absence of any practical demonstration of the superiority of reinforced concrete as a fire-resistant. The absurdity of such an argument is at once apparent if any value can be attached to the fire tests carried out by the Fire Prevention Committee, and the high awards given to reinforced concrete specialists. It may be said of such tests that they are more or less unpractical—in other words, that the actual conditions of a real fire are absent. This objection may be answered by reference to a fire that recently took place at the Dayton Motor Works, a short account of which may prove interesting.

Two buildings were erected side by side, one of which was constructed in brick, and the other in reinforced concrete on the Kahn system. A fire broke out on the fourth floor of the reinforced concrete building, and burnt out the entire contents of the floor. The fire doors not being in position, the fire communicated into the brick building, which was fitted with a sprinkler system, despite which two of the floors were completely gutted, and the entire building was, for practical purposes, demolished. The total repairs to the reinforced concrete building involved a cost of only £100, and were completed and work resumed after a test had been carried out of double the load for which the building was designed within one month from the date of fire. The brick building, so far as we know, is incomplete to-day.

The fire proved almost beyond a doubt that under modern conditions of extraneous fire prevention, a reinforced concrete building cannot be burned out. It has been demonstrated at this and other fires that an intense heat will affect only the outer layer of concrete to a small degree, and where bars with rigidly attached diagonals are used, such as in Dayton Motor Co.'s works, the lower inch of concreting being used for fireproofing only, the strength of the main girder is unaffected. These are important points to every business man, because thereby he has the three-fold knowledge, assuming his building to be of reinforced concrete, first, that it is the highest form of fire-resistant; secondly, that if a fire does break out it must needs be confined to one floor; thirdly, that the necessary repairs resultant upon a fire may be speedily completed, and work resumed. If, in addition to these advantages, he could secure, say, a 10 per cent. preference on his insurance premium, then, beyond question, we should see a much-needed improvement in the building trade, and a decrease in fires. The illogical, not to speak of arbitrary attitude of the insurance ring towards the question has induced several well-known firms to take up their own fire risks with satisfaction to themselves. It may be if there be no other solution to the difficulty, that an association of capitalists for the purpose of dealing specially with the insurance of reinforced concrete constructions would act beneficially, not only for themselves, because the risk is small, but for the prospective builder, and trade in general.

The enormous profits and huge salaries paid by insurance companies show clearly that there is an ample margin as far as they are concerned. These excessive profits can only be made at the expense of the commercial man who is already burdened with heavy taxation and keen competition, therefore the need for protest and action is urgent.



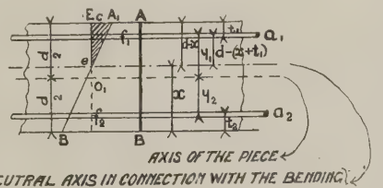
REINFORCED CONCRETE MEMBERS SUBJECTED TO DIRECT TENSION & BENDING COMBINED. PROPOSED NEW FORMULÆ:

By D. A. Kambero.

Recently I had to design two partition walls of a building intended to be constructed of reinforced concrete; these two partition walls were between the fourth and fifth floors of the building, and underneath them was a large hall, so that the walls were only supported by columns at the extreme ends. In addition to the dead weight of the walls, they had to carry the floors of the fourth and fifth storeys. The dimensions and weights were as follows:—Clear span=52ft., height of the wall=10ft. 10ins., thickness=9ins., dead load of the wall per foot run of the span=1,120-lbs., weight of the fourth storey floor=4,245-lbs. per foot run of the span, weight of the fifth storey floor=4,155-lbs. per foot run of the span, reactions R_1 and R^2 of the ends of the walls considered as beams=110.5 tons, total weight to be carried, per foot run of the span=9,520-lbs., bending moment in the middle of the wall considered as a beam=38,613,120-inch lbs.

The accepted design for each of those two partition walls was that of a trussed beam with chords, struts, and ties of reinforced concrete on the Kahn system, with the spaces between the ties and struts filled with expanded metal and plaster.

The accompanying sketches show the different arrangements.



In calculating the stresses of the chords, ties, and struts, I met with the difficulty that the portions of the bottom chord were subjected to direct tension on account of the truss action, and at the same time to bending on account of the continuous floor of the fourth storey.

Although I consulted several standard books, I was unable to find any literature dealing with a similar case of reinforced concrete being subjected to direct tension and bending combined, so I was obliged to consider the case without their aid. I give the following calculations in the hope that they will be of some use to engineers who meet with similar cases to the above, and they also apply to reinforced concrete bridges for general traffic, of the bowstring or trussed beam type, where the bottom boom of the main girders has to carry the outer edges of the deck slab.

The following symbols are used in the calculations:—

B = the bending moment the piece is subjected to;
T = the direct tension the piece is subjected to;
d = the depth of the piece;
*C = the breadth of the piece;
a_1 = the sectional area of the top reinforcement;
a_2 = the sectional area of the bottom reinforcement;
c = maximum compressive stress per square unit of the concrete;
f_1 = tensile stress per square unit of the metal of the top reinforcement;
f_2 = tensile stress per square unit of the metal of the bottom reinforcement;
f_t = the same as f but is indicated thus, when in conjunction with the symbol f_c
f_c = compressive stress of the metal per square unit;
t_1 = the distance of the centre of the top reinforcement from the upper surface of the piece;
t_2 = the distance of the centre of the bottom reinforcement from the bottom surface of the piece.
y_1 = the distance of the centre of the top reinforcement from the axis of the piece.
y_2 = the distance of the centre of the bottom reinforcement from the axis of the piece.
x = the distance of the *neutral axis* from the *bottom* surface of the piece.

1st Case.—Let us assume that the bending moment is not sufficient to eliminate the tension on the compression side of the piece, and that at both sides exists tension; also that the reinforcement is of small sectional area and depth, and is at both sides of the piece.

Examining the section AB, we may suppose it to take up the position A_1B_1 under the effect of the direct tension and the bending moment, where f_2 and f_1 are the maximum and minimum stresses in the metal respectively; the concrete under the effect of the bending moment will be compressed according to the triangle EOA, *and since we neglect any tension existing in the concrete.*

It is evident that:

$$T = f_1a_1 + f_2a_2 - \tfrac{1}{2}c\,(d-x)\,C \quad \ldots\ldots(1)$$

and

$$B = f_2a_2y_2 - f_1a_1y_1 + \tfrac{1}{2}c(d-x)\left(\frac{d}{6}+\frac{x}{3}\right)C \quad (2)$$

taking moments round o_1, and considering as + the clockwise moments and as − the counter-clockwise moments.
